[We have seen several so-called sports of this variety, but some of them were mere variations from different buds, similar to examples sometimes afforded by the Princess of Wales. The bloom sent differs somewhat from others that have come under our notice by its primrose colour, but it was so damaged that no opinion could be formed of its true character.]

CHRYSANTHEMUM PIERCY'S SEEDLING.

I CAN fully endorse all that "J. J. C." (page 379) says in favour of this variety. I have grown it for two years, and find it most valuable both in the garden as a decorative flower and for providing cut flowers. Its only equal for free flowering qualities seems to be Flora, but, of course, the colour is quite distinct, so that both may be grown with advantage. By the way, why is Flora known also as Late Flora? I take them to be the same. There is a very hardy late flowering purple Chrysanthemum grown in the cottage gardens here which is very valuable for decoration late in the year. It will not be in flower for some time, but I shall endeavour to get it named when in bloom. It grows into great bushes and receives the roughest treatment only.—S. ARNOTT, *Dumfries.*

CHRYSANTHEMUMS IN NORTH WALES.

MR. PRICE, the gardener at Pontryffyd, the residence of Col. Mesham, is well known in the locality as an enthusiastic grower of Chrysanthemums, and his collection this season appears to excel anything yet achieved. About 250 plants are grown, and, although not an exhibitor, he would prove a very dangerous opponent at Liverpool next month, judging by the sturdy and healthy appearance of the plants as seen last week.

The plants are artistically arranged in the front of a large Peach house, and range in height from 18 inches to 5 feet, each plant carrying from four to six blooms. A great feature in Mr. Price's culture is, that he has timed his blooms, so that they appear to be all opening simultaneously. Among the newer varieties grown are Bouquet de Dame, Vivand Morel, Florence Davis, and Gloire du Rocher, all promising well.—VISITOR.

CHRYSANTHEMUMS AT LEICESTER.

THE other day I asked a Leicester grower how his "Mums" were this year. "I have never seen better," was the reply, and on visiting some of the larger growers of the district this answer will suit them exactly.

ABBEY PARK.

The collection here will be quite able to sustain its reputation, and in the course of a week or so will be the delight of the eager crowd who visit the "Mum" house there. Altogether there are about 1500 plants, and a more healthy and clean batch could not be found, and both Mr. Burn and also Mr. Burton, his assistant, are to be congratulated in providing such a treat for Leicester people.

AT HUGHENDEN.

Mr. George Oliver has an excellent collection under the care of Mr. W. Calvert, and if good buds are anything to judge by he will be a strong opponent in the local classes at the Leicester Show. At present he has some grand blooms of Louis Boehmer which would not disgrace a show board. These, with the excellent bloom of Mrs. Alpheus Hardy I saw at Glenwood last year, have done much to remove the prejudice I previously held to the "hairy" section. The Japs are in strong force, and contain some good and promising flowers. The incurved, which are perhaps a few days later, are well represented by the leading varieties. A very noticeable feature is the foliage—every plant is clothed to the bottom, and another is the quantity of small plants varying from 6 inches to a foot in height, carrying magnificent buds or blooms. The majority of these were not struck until August. Altogether, there is every prospect of Hughenden retaining if not strengthening its position in the Chrysanthemum world at the forthcoming show.

AMONGST THE COTTAGERS.

It is almost wonderful what a quantity of good blooms can be obtained by some of them in so limited a space. Mr. Day of Aylestone Park has some very promising buds of Avalanche, La Croix, F. A. Davis, the new W. H. Lincoln, Vivand Morel, grand Stanstead White, and A. H. Neve in the Japs. The Princess family are excellent, but the Queens are hardly up to last year's mark. Mr. H. Yeomans is bidding fair to improve his position in the working men's classes, while Messrs. J. Whait and H. Bell each have some good things, and will prove severe antagonists.—W. BELL, *Leicester.*

BATTERSEA PARK.

THE display of these most beautiful autumnal flowers in the above park is a magnificent one, and it will, doubtless, be visited by many thousands of people during the next few weeks. The estimable superintendent, Mr. Coppin, has made the most complete arrangements to permit the visitors to have a good view of both plants and flowers without any undue crushing which prevails at many similar exhibitions.

The collection comprises upwards of 1600 plants, amongst which all the leading varieties are well represented. The plants are arranged in a bank in a span-roofed house, divided in the centre. They are of a sturdy nature, and reflect great credit on Mr. Tilbury, the grower. Had there been sufficient space in the house to permit of a path running

completely round the plants, the flowers could have been seen to greater advantage. Perhaps ere another Chrysanthemum season dawns on us Mr. Coppin will have a far larger place at his disposal, when, doubtless, a most charming display will be opened for public inspection.

To name all the varieties in the collection would be almost impossible. A few of the most prominent include William Tricker, Charlotte de Montcabrier, Lord Alcester, Queen of England, Empress of India, and her golden sister, Emily Dale, John Doughty, Prince Alfred, Lord Wolseley, Hero of Stoke Newington, Dupont de L'eure, Mr. A. H. Neve, Reverie, Lady Trevor Lawrence, Lady Dorothy, Mrs. J. Wright, Flamme de Punch, Condor, Mrs. Wm. Waterer, Phœbus, Mons. R. Bahuant, Gloire du Rocher, J. S. Dibben, Gorgeous, Joseph Mahood, Alfred Chantrier, Avalanche, Ada Spaulding, George Daniels, President Hyde, Stanstead Surprise, Etoile de Lyon, Louis Boehmer, Triomphe du Nord, Mons. Garnier, Peter the Great, Val d'Andorre, La Frisure, Bouquet de Dame, Golden Beverley, and some very fine Mrs. Alphcus Hardy.

The plants are now in the very best of condition, and intending visitors would do well not to delay. The collection, taken as a whole, is a decided improvement on that of last year.

WATERLOW PARK.

Considering the fact that the plants have been grown under disadvantage, and that this is the first season, Mr. R. Curle, the superintendent, has just cause to be proud of the Chrysanthemums at the above park. Assisted by his grower, Mr. Webb, he has managed to work up a collection that must be given a place among the front ranks of those seen at the metropolitan parks. The plants are dwarf in habit, and have sturdy stems, bearing that thick dark green foliage which every grower likes to see.

As has been already mentioned in these pages about 1500 plants are grown, and the bulk of these are arranged in two banks in a lofty conservatory, a path running through the centre. Here we noted many fine blooms, and in the course of a week or so a large number of promising buds will have developed into splendid flowers. A few of the recent introductions are grown, but Mr. Curle acts wisely in giving the best old sorts a prominent place, in order to secure a good display. Amongst the Japanese, Elaine was carrying some excellent blooms, as also was that beautiful variety Source d'Or. For decorative purposes the last-named is still one of the best, the old gold colour of the flowers being most charming. Madame Louise Leroy has also done remarkably well here, and is now producing some splendid blooms, whilst scarcely less can be said of Belle Paule, Etoile de Lyon, Margot, Mons. Tarin, La Triomphante, Comte de Germiny, and Mons. W. Holmes. The rich blooms of the last-named appears to great advantage, showing well amongst those of a lighter character. Other varieties with good blooms include Stanstead Surprise, Eynsford White, Stanstead White, Holborn Beauty, and Mons. R. Bahuant. Vivian Morel was not out at the time of our visit, but gave promise of developing magnificent flowers.

Of incurved varieties the old Mrs. G. Rundle was exceedingly good, affording ample evidence that when well grown it is still worthy of a place in every collection. Mr. Bunn and Golden Beverley were also good. The same may be said of Lord Alcester, John Doughty, Queen of England, and many others too numerous to mention.

Besides those referred to there are several groups arranged in the vineries. Amongst these Pompons and various late kinds predominate, so that a display will be ensured for several weeks yet. These plants are healthy and well covered with buds, a few of which were expanding. One variety we particularly noticed as having hirsute florets, this being the old Chang, a dark orange red incurved Jap. This feature was equally as conspicuous as in many of the so-called "hairy-petalled" varieties. Other plants, including Fuchsias and succulents, are arranged on the front stages in the vineries, and these, with the Grapes still hanging, form a pleasing contrast to the Chrysanthemums.

THE TEMPLE GARDENS.

Chrysanthemums have so long been associated with the Inner Temple Gardens that the display seen there is generally considered to be one of the best within the metropolitan area. As in former years so in the present season, Mr. Newton has brought together a collection which fully maintains the reputation he has so long enjoyed, there being now some 700 plants on view. These are arranged in a new conservatory abutting the end of the terrace known as the King's Bench Walk. The Show is larger than usual and is full of interest. In addition to the best old varieties all the latest introductions of merit are grown, and these combined make an excellent display. The plants are remarkably healthy considering the fact that they were grown within a stone's throw of one of the busiest thoroughfares of the metropolis, and many of them are carrying exceedingly fine blooms.

Among the newer varieties W. Tricker is very good, the flowers being large and well coloured. Mons. R. Bahuant is also noticeable, and so is Gloire du Rocher, the latter being one of the best in the Show. The former is likewise carrying large blooms. Cesare Costa is very striking, the deep crimson flowers showing up well. Vivian Morel, too, is developing some grand blooms, and the same may be said of J. Stanborough Dibben and Annie Clibran. The last-named is a charming pink, and one of the prettiest in the collection. Ami Hoste appears to advantage, and so does W. H. Lincoln, one of the best yellows in cultivation. Of the older varieties Elaine has for some time past been flowering splendidly, and many plants are still carrying fine blooms. Lady Selborne also bears evidence of its utility, and the same applies

to numerous other early flowering varieties. Curiosity is splendid, and in a few days Stanstead White will be in grand condition.

In addition to the collection arranged in the conservatory alluded to there is a small group in an annexed structure, and amongst these we noticed Louise Boehmer, with promising buds. On the whole the Show is one of the best we have seen in these gardens.

THE BEAUTY OF EXMOUTH CASE.

At a meeting on Tuesday evening of the Sub-Committee appointed to examine into this case from materials with which we supplied them, the following resolution was unanimously adopted:—

"That inasmuch as the charges brought by the *Journal of Horticulture* against a member of the Floral Committee of the National Chrysanthemum Society are made in exceedingly vague terms, and as the letter upon which the charges were founded is not published, or the name of the member incriminated made publicly known, the sub-committee are unable to effectively deal with the matter. They consider that in justice to all concerned the publication of the letter is imperatively called for."

[The officials of the National Chrysanthemum Society have the requisite means for carrying out this resolution in the publication of the letter for circulation among the members of the Society, and that, we presume, is what is intended to be done as the natural result of the resolution. To this course we have not the slightest objection. The matter is in their hands. We made no charges, but placed in the hands of the officials the letter on which our references were founded, and they cannot say that these references went beyond the communication to which the resolution pertains.]

LITHOSPERMUM PROSTRATUM.

THIS is a useful plant for a rockery, and is well known in many gardens where rock plants are grown. The plant grows freely trailing

FIG. 55.—LITHOSPERMUM PROSTRATUM.

over the stones or rocks, and clothing them with its dark green shoots and foliage, among which appear the rich dark blue flowers in profusion. For the margins of borders where the soil is not too heavy, or the situation low and damp, this little Lithospermum is also well adapted, and blooms throughout the summer months and often late into autumn. The spray represented in the woodcut (fig. 55) was taken from a plant flowering as late as last week. The illustration shows the chief characters of foliage and flower.

CHRYSANTHEMUM SHOWS.

GOSPORT.—OCTOBER 27TH.

THE annual Exhibition of the Gosport and Alverstoke Society was opened on the date named in the Thorngate Hall, and considering the backwardness of the season was very creditable to all concerned.

Cut blooms were staged in tolerably large numbers and were of fairly

good quality. The principal class was that for twenty-four distinct varieties, half Japanese, and the remainder incurved. Mr. G. Hawkins, gardener to E. Laphorne, Esq., Gosport, was an easy winner, staging full heavy Japanese and fairly good incurved. Vivian Morel, W. H. Lincoln, Stanstead Surprise, and Cesare Costa were the most noteworthy among the Japanese. Jeanne d'Arc, Lord Wolseley, Nil Desperandum, and Mrs. Naish were conspicuous in the incurved section. Mr. B. Sims, 39, Shaftesbury Road, Gosport, was second with smaller but neat blooms.

Mr. Hawkins was also successful in the classes for eighteen Japanese, distinct, and eighteen incurved, staging excellent blooms of the leading varieties. Mr. Sims was second in the Japanese class, having smaller yet neat examples. For twelve reflexed, in not less than six varieties, Mr. J. Hillier, gardener to S. T. Blake, Esq., Gosport, was an easy first. King of Crimson, Phidias, and Distinction were the best. Mr. T. W. Hatch, Seafeld, won easily in the class for twelve Japanese with good examples of Mrs. F. Jameson, E. Molyneux, W. H. Lincoln, Sunflower, and Cesare Costa. Mr. J. Hillier was second.

Pompons, three blooms to a bunch, were best staged by Mr. H. Lee, 3, Toronto Place, Gosport, and comprised highly coloured blooms of Mdle. Elise Jordan, Madame Martha, and Golden Circle. Mr. H. Dance, gardener to Mrs. Rowe, was second. The premier incurved bloom was Nil Desperandum, Mrs. F. Jameson occupying a similar honour in the Japanese section, both belonging to Mr. H. Lee. The N.C.S. certificate was awarded to Mr. G. Hawkins for excellence of culture. The best group of Chrysanthemums was staged by Mr. T. H. Watch, the plants being dwarf, with good foliage, and carrying fine flowers. Plants in other classes were creditably staged, as also were table plants and Primulas.

Vegetables were numerous and well staged, Mr. G. Hawkins winning somewhat easily for nine varieties, all of excellent quality. Hardy fruit was extremely well shown, Messrs. Hawkins and W. & J. F. Legge being the principal prizewinners. Mr. H. J. Spence, as usual, had all the arrangements in a satisfactory condition.

HAVANT.—OCTOBER 28TH.

THE ninth annual Show was held as usual in the Town Hall, and considering the early date and the late season was a success. The competition was not quite so strong as last year, but the quality of the exhibits was above the average. The arrangements, under the superintendence of Mr. Chignell, the Hon. Secretary, assisted by a hard-working Committee, were good.

Cut blooms were the most important feature of the Show. The principal class was that for forty-eight, half incurved varieties and the remainder Japanese. Mr. Penford, gardener to Sir F. Fitzwygram, Bart., M.P., Leigh Park, Havant, won the premier award with a bright stand of blooms, especially the Japanese. Sunflower, Bouquet de Dame, Vivian Morel, Avalanche, and Stanstead Surprise were the most noteworthy. A splendid bloom of Refulgens was staged in the incurved stand. Mr. J. Agate, gardener to W. Pawson, Esq., Havant, was second with good Japanese, Stanstead White being extra fine.

For eighteen, nine incurved, and the same number of Japanese, Mr. Steptoe, gardener to — Gale, Esq., Horndean, won rather easily with fairly good blooms. Mr. Parrot, gardener to Mrs. Kineaid Smith, gained first prize for twelve Japanese with full blooms of good quality. Mr. Agate was second; Mr. Penford securing a similar award for the same number of incurved blooms. Mr. Agate, as usual, staged the best single and Pompon blooms in bunches of three of one variety. Groups of Chrysanthemums and miscellaneous plant groups were meritorious, making an effective display.

BRIXTON.—NOVEMBER 1ST AND 2ND.

THE Show of the Brixton, Streatham, and Clapham Society was held in the Town Hall at Streatham this year and proved to be quite up to the average in quantity and quality, though the cut blooms, incurved especially, were rough. Many of them would have been all the better for a few more days' development, and the same remark applies to the Japanese, many of which were not quite developed.

The first prize for twenty-four incurved went to Mr. W. Howe, gardener to H. Tate, Esq., J.P., whose blooms had weight but not finish. Lord Wolseley, Violet Tomlin, Prince Alfred, and Prince of Wales were the best, the heavier blooms, such as Lord Alcester, John Lambert, Queen of England, and Empress of India being ill-furnished and coarse. Mr. Poulton, gardener to C. T. Cayley, Esq., was second with half-developed blooms. He was somewhat fortunate to get a prize at all, for the flowers ought to have been on the plants some time longer. Mr. Howe also won with twelve, his blooms being of very much the same character as the twenty-four—namely, weighty but lacking smoothness. Robert Cannell was about the best. Mr. Poulton was second, and Mr. Stevens, gardener to B. F. Smith, Esq., third. Mr. Wiggins and Mr. Stevens were first and second with six. Mr. Howe's Japanese were better than his incurved, albeit one or two would have done very well with a little more time. Mrs. Falconer Jameson, Mrs. E. W. Clarke, Etoile de Lyon, Sunflower, Mrs. Beckett, and Stanstead White were excellent flowers. Mr. Mursell, gardener to Mrs. Burton, was a good second, but still losing nearly a point on every bloom against Mr. Howe. Mr. Ouseley, gardener to R. Lyell, Esq., was third. Mr. Howe won again with twelve, these being hardly equal to the others. Mr. Mursell was a close second, and Mr. T. Stevens third. Mr. Guyett was first with six. The first prize for large Anemone-flowered fell to Mr. Pearce, gardener to Mrs. Fletcher Bennett, for neat flowers of medium quality, and that for Pompons to Mr. Stevens, other prizes going to Mr. Fulbrook, gardener to B. B. Baker, Esq. Mr. Howe was first with reflexed.

There were other classes for cut blooms, and the most successful exhibitors were Messrs. Guyett, who won Mr. Hibbert's special prize; Mr. Mursell, who secured the prize offered by Messrs. Reid & Bornemann; Mr. Howe won the first prize offered by Thomas Gabriel, Esq., with a good stand of twelve Japanese, also that offered by J. Margetson, Esq., for Japanese cut with long stems and foliage; and Mr. A. Rofe, who was first in the maiden class.

The specimens were not nearly ready, and many of them ought to have been left at home. Mr. Cherry, gardener to Mrs. Gabriel, won with six plants well trained and flowered, but the blooms were only partly developed. Mr. J. Martineau, gardener to Dr. Martineau, was second, but two of his plants were only in bud. Mr. Cherry was also first in another class for six, but one plant only bore a few expanded blooms, the rest being in the bud stage. Pompons were not nearly ready. Mr. Weston was first, and Mr. Cherry second.

There was an excellent display of stove and greenhouse plants, Orchids, cut flowers, and fruit; the whole making up an attractive exhibition. The arrangements were in the capable hands of Mr. W. Roupell.

KENT COUNTY.—NOVEMBER 1ST AND 2ND.

TRACES of the lateness of the season were by no means absent from the Kent County Chrysanthemum Society's Show this year, nevertheless the Exhibition was an excellent one. The incurved blooms were somewhat weak, evidently requiring more time; but there was material of the highest quality in the Japanese section, and the number of fine novelties on view lent added interest to the display.

There were three stands of thirty-six blooms, eighteen incurved and eighteen Japanese, and the best of them was that staged by Mr. Whittle, gardener to C. H. Goachen, Esq., Ballards, Addington, Croydon. There was a great difference between the two sections of his exhibit—the incurved being imperfectly developed, while the Japanese were large, well filled, and good. The former were John Lambert, Empress of India, Alfred Salter, Golden Empress, Mons. R. Bahuant, Queen of England, Mrs. Shipman, Nil Desperandum, Jeanne d'Arc, John Doughty, Lord Alcester, Violet Tomlin, Lady Hardinge, Ami Hoste, Princess of Wales, M. A. Haggas, Refulgens, and Madame Darrier. The Japanese were Colonel Smith (splendid), Stanstead White, E. Molyneux, Etoile de Lyon, W. H. Lincoln, Vivian Morel, Avalanche, Jeanne Délaux, Irving Clarke, Stanstead Surprise, Gloire du Rocher, Marie Hoste, Mrs. Falconer Jameson, Edwin Beckett, W. Tricker (in fine colour), Sarah Owen, Puritan, and Sunflower. Col. Smith was undoubtedly the pick of the box; it is a great acquisition. The second prize went to Mr. R. Leadbetter, gardener to A. G. Hubback, Esq., Elmstead Lodge, Chislehurst, whose incurved were perhaps a trifle better than Mr. Whittle's, but lacking in weight, while the Japanese were hardly so well filled. Mrs. E. W. Clarke, Mdle. Marie Hoste, and Coronet were the best of the latter; and Lord Wolseley and Violet Tomlin the pick of the incurved. The third prize went to Mr. Rowbottom, gardener to H. R. Williams, Esq., The Priory, Hornsey, whose incurved, which ran somewhat small, were strengthened by a beautiful bloom of Madame Darrier, a charming light bronze flower tipped with gold, which was selected as the best in the Show. The Japanese were neat, but not heavy. Mr. Whittle was again first with twenty-four Japanese, showing medium sized, fresh, and well-coloured flowers. Colonel Smith and Marie Hoste were extremely beautiful, while Vivian Morel, Mrs. E. W. Clarke, and W. Tricker were conspicuously good. Mr. J. Mackenzie, gardener to F. S. W. Cornwallis, Esq., M.P., Linton Park, Maidstone, was a very good second, albeit one or two of his flowers were rather thin. John Dyer, a mixture of yellow and bronze, was somewhat striking. Mr. Leadbetter was third. Mr. Mackenzie won with twelve—an excellent stand. Colonel Smith showed the most prominently in it; this noble variety has already secured a high position as an exhibition Japanese. Mr. Leadbetter was second with rather flat flowers; and Mr. Wheadon, gardener to R. J. Collier, Esq., third.

The incurved classes were nothing like so strong as the Japanese. Mr. Whittle won with twelve, but they were far below his usual strength, and he will no doubt be better a few days hence. Mons. R. Bahuant, Empress of India, and Nil Desperandum were the best, Violet Tomlin and Queen of England being, though large, unfinished. Mr. Mackenzie was second with Refulgens as his best example, and Mr. Lyne, gardener to H. F. Tiarks, Esq., Foxbury, Chislehurst, third. Mr. Leadbetter was the only exhibitor of reflexed, and was placed first for a good stand. Mr. Tickner, gardener to J. Watney, Esq., Shermanbury House, Reigate, was first with Pompons. Mr. Leadbetter had the best large Anemone flowered, Delaware being by far the finest bloom. Mr. Tomalin, gardener to S. White, Esq., was second, and Mr. Tickner third. Mr. J. Pearce, gardener to J. Wainwright, Esq., Belmont, Lee, was first with six white Japanese, Elaine representing him. A. J. Scrutton, Esq., Eagle House, Eltham, was second with Florence Percy. The corresponding class for coloured Japanese brought out three splendid stands, Mr. Rowbottom being placed first, second, and third with Sunflower, W. Tricker, and Puritan respectively, all of a first prize grade in the ordinary course of competition. He showed a lovely box of Mdme. Darrier in the class for six incurved, small, but exquisitely moulded and finished. Mr. Whittle was second with Queen of England, and Mr. Scrutton third with Mrs. Rundel.

In the local classes the competition was not very brisk, many exhibitors who were expected not putting in an appearance owing to the lateness of the season. Mr. Rhoden, gardener to J. Vavasseur, Esq., Rothbury, Blackheath Park, was the only exhibitor of twenty-four

blooms, and was awarded the second prize. He had a similarly easy task with twelve Japanese, but had better blooms, and was placed first. For six incurved he was second. Mr. Couldrey, gardener to J. Terry, Esq., The Shrubbery, Grove Park, had a very neat stand of six Japanese, and deservedly received the premier award. Mr. R. W. Allen, 98, Palace Road, Bromley, had an excellent stand of twelve Japanese, albeit the flowers were a little flat. Mr. W. G. Clark, 10, Fishpond Road, Hitchin, was second. Mr. Allen won again with six; Mr. Clark being second, and Mr. C. S. Chantler, 39, Endwell Road, Brockley, third. For six of one variety the latter was placed first. He had a neat box of W. Holmes. In another class for Japanese, Mr. Bertenshaw, 22, Hansler Road, East Dulwich, was first. The prizes for mixed blooms went to Messrs. F. T. Shepley, J. Downs, and C. E. Gardner; other prizes in the smaller classes going to Messrs. Bertenshaw, Niesigh, Chantler, and Copey.

The class for eight Japanese, eight incurved and eight reflexed, brought a good stand from Mr. Leadbetter, which was deservedly awarded the first prize. Mr. Hewitt, gardener to H. B. Mackeson, Esq., was first with six blooms of Avalanche, Mr. Whittle second, and Mr. Leadbetter third, all having charming stands. Mr. Whittle had a beautiful box of Vivian Morel, and was placed first, his best example, a truly magnificent bloom, being selected as the best Japanese in the Show. It was one of the finest ever exhibited. Mr. Rowbottom was second; and Mr. Moore, gardener to Carl Jay, Esq., third.

Messrs. Perkins, Coventry, were first for a hand bouquet of Chrysanthemums; Mr. W. Garton second, and Mr. J. R. Chard third. Mr. T. Dobson, gardener to F. P. Preston, Esq., had the best group of Chrysanthemums, and Mr. Lyne the best mixed group, other prizewinners being Messrs. Rhoden, W. Jeffery, H. J. Williams, and A. Tomalin. Mr. H. J. Jones, Ryecroft Nursery, Lewisham, had a charming group not for competition, comprising many promising novelties; W. H. Atkinson, a Japanese, is likely to turn out well. Messrs. E. D. Shuttleworth & Co. had a fine group of Palms and Cycads, for which a silver medal was granted. Fruit was a very good display, but space cannot be found for the awards.

WATFORD.—NOVEMBER 1ST AND 2ND.

A BEAUTIFUL Show was held at the Watford Agricultural Hall on the above dates. Groups of Chrysanthemums and miscellaneous plants were plentiful and admirably arranged, some thirteen of these being in competition.

Mr. Ashdown, gardener to C. R. Humbert, Esq., Dell Field, Watford, was a good first with a grand group, the flowers large, and plants well arranged. Mr. Higgins, gardener to Lieut.-Col. A. G. Lucas, Ashlyns, Berkhamsted, was second. In the members' class, for a group, Mr. Wild, gardener to W. B. Hawkins, Esq., Houndswood, St. Albans, was first; and R. T. Prouse, Esq., Howton, Bushey Heath, second. The plants were well arranged, but far behind the open class in quality.

In the cut bloom classes Mr. Beckett, gardener to H. H. Gibbs, Esq., Aldenham House, Elstree, maintained the leading position he has held for some years past. For twenty-four incurved, distinct, he was a good first, showing—back row: John Lambert, M. Bahuant (the premier incurved in the Show), Queen of England, Golden Empress, Empress of India, John Doughty, Lord Alcester, Alfred Salter. Second row: Violet Tomlin, Mrs. Heale, Madame Darrier, Princess of Wales, Lord Wolseley, Jardins des Plantes, Prince Alfred, Jeanne d'Arc. Front row: Nil Desperandum, Mr. Bunn, Refulgens, Beauty, Mrs. Shipman, Princess Beatrice, Barbara, and Camille Flammarion. Mr. Neve, gardener to C. Van Ralte, Esq., Aldenham Abbey, Watford, was second with good flowers.

For twelve incurved, Mr. Dinsmore, gardener to T. F. Blackwell, Esq., Harrow Weald, was first, and for six incurved, one variety, Mr. Neve secured leading honours.

Mr. Beckett was first with twenty-four incurved in the members' class, comprised principally of the varieties already enumerated. Second, Mr. Neve.

The Japanese classes were better filled, and the flowers generally of good quality. In the class for twenty-four, open, Mr. Beckett staged some excellent blooms, comprising—back row: Mrs. E. W. Clarke, Avalanche, Alberic Lunden, Etoile de Lyon, Gloire de Rocher, Madame M. Hoste, Mrs. F. Jameson, Vivian Morel (fine). Second row: Sunflower, E. Molyneux, Puritan, M. Marrouch, E. Beckett, W. Tricker, Stanstead White, W. H. Lincoln. Front row: Jeanne Delaux, Miss A. Hartzhorn, Excelsior, Marquis de Paris, Masterpiece, Mrs. E. Beckett, Roi de Japonais, Mrs. M. Thrower. For twelve Japanese, Mr. Dinsmore was first; Mr. Watchorn, second; and Mr. Neve, third. For six white Japs, Mr. Beckett was first, having large Stanstead White; Mr. Fortnum, gardener to J. Larkin, Esq., Delrow House, Watford, was second.

The competitors were more numerous in the members' classes, especially the Japanese. Mr. Beckett was very strong, and in his stand was found the best Japanese bloom in the Show, a very deep flower of Mrs. Falconer Jameson. Mr. Dinsmore was first for twelve Japanese; second, Mr. Wild; third, Mr. Fortnum.

Mr. Myers, gardener to the Earl of Clarendon, contributed a fine central group, composed of Palms, Chrysanthemums, and other flowering plants, which is a leading feature; Messrs. Lane & Son, Berkhamsted, a large collection of Apples, Nuts, and Grapes. Messrs. Laing and Sons also sent a collection of Apples, and Messrs. Cutbush & Son a group of flowering plants.

Vegetables were very good. For Messrs. Sutton's prizes Mr. Brown was first, closely followed by Mr. Beckett.

BRIGHTON.—NOVEMBER 1ST AND 2ND.

THE tenth annual Exhibition was held, as usual, in the Pavilion, and was a remarkable success.

The most important class was that for forty-eight cut blooms, half incurved and the remainder Japanese, not less than eighteen varieties in each section; £10 was offered as first prize, £7 for second, and £5 for third. Messrs. W. & G. Drover, The Nurseries, Fareham, won easily with large, solid, highly coloured Japanese blooms, and neatly finished incurved of medium size. The varieties were:—Japanese: Vivian Morel (2), Puritan (2), Sunflower (2), Mrs. C. Wheeler, Mrs. F. Jameson (2), E. W. Clark, Florence Davis (2), Edwin Molyneux (2), Miss A. Hartzhorn, M. Bernard, Etoile de Lyon, Comte de Germiny, Mrs. A. Hardy, Beauty of Kingessing, Cleopatra, Gloire de Rocher, Avalanche, W. H. Lincoln; incurved: Golden Queen of England (2), Prince Alfred (2), Lord Wolseley (2), Lord Alcester, Queen of England, Violet Tomlin, Madame Darrier (2), Alfred Lyne (2), Novelty (2), Prince of Wales, Princess Beatrice, Mrs. Heale, Nil Desperandum, Alfred Salter, Jeanne d'Arc, Madam F. Mistral, Lady Hardinge, Mrs. W. Shipman. Mr. Penford, gardener to Sir F. Fitzwygram, Bart., M.P., Leigh Park, Havant, was a creditable second, and Mr. C. Ritchings, gardener to Dr. Frankland, The Yew, Reigate Hill, third.

For twenty-four blooms, twelve incurved and the same number Japanese, all to be distinct, four competed, the best coming from Mr. Penford, an even bright coloured stand of blooms. The varieties were incurved: Violet Tomlin, Jeanne d'Arc, Empress of India, Queen of England, Princess of Wales, Alfred Lyne, Miss M. A. Haggas, Novelty, Mr. Brunlees, Mrs. Heales, Nil Desperandum, Mrs. Coleman; Japanese: Boule d'Or, Etoile de Lyon, Condor, Bouquet de Dame, Wm. Holmes. Sunflower, Vivian Morel, Ralph Brocklebank, Wm. Tricker, Gloire de Rocher, Avalanche, and E. Molyneux. Mr. W. Wallis, gardener to J. Mews, Esq., Hartwell, Heartfield, was a close second; and Mr. R. Phillips, gardener to Dr. Baker, Brighton, third.

The class for twenty-four Japanese, distinct, brought five competitors, making a good display. Mr. T. Glen, Worth Park, Crawley, was an easy first, with the following in capital condition:—Mrs. C. Wheeler, E. Molyneux, Florence Davis, Vivian Morel, Mrs. F. Jameson, Gloire de Rocher, Stanstead Surprise, Coronet, Puritan, Miss A. Hartzhorn, W. Tricker, F. Marrouch. Mr. Wallis was second, with good examples; and Mr. G. Duncan, gardener to C. J. Lucas, Esq., Warnham Court, Horsham, third. There was but one entry in the class for twelve incurved, but this produced the finest stand of blooms in the Show, notably from Mr. C. Goldsmith, gardener to Sir E. G. Loder, Leonardslea, Horsham. The varieties were Alfred Salter, Empress of India, Lord Wolseley, Golden Queen of England, M. Bahuant, Alfred Lyne, Queen of England, Prince Alfred, Jeanne d'Arc, Refulgens, Robert Cannell, and Mrs. W. Shipman. Twelve Japanese, distinct, brought seven competitors, the best coming from Mr. J. P. Heasman, gardener to Mrs. Oxley, Fern Place, Turner's Hill. Mr. A. Emery, gardener to M. G. Megam, Esq., Avoca, Eastbourne, was second; Mr. J. Coles, gardener to Mrs. Nichols, Highby Manor, Balcombe, third.

For six incurved, one variety, Mr. Jupp won with Jeanne d'Arc; Mr. Wallis second with Mrs. Heales. For the same number of Japanese, one variety, Mr. Glen won with W. Tricker, of huge size and rich in colour, Mr. Jupp following with Sunflower, while Vivian Morel secured for Mr. Wallis the third place.

Groups of Chrysanthemums were a feature of the Show. The principal class was that for one arranged in semi-circular form of 14 feet by 8 feet. Mr. G. House, gardener to F. Mowatt, Withdeane Hall, Patcham, won easily with capitally grown freely flowered bush-like plants, the colours being harmoniously arranged in a sloping bank-like form without being in any way formal. Mr. J. Miles, Bristol Nurseries, Kemp Town, Brighton, was second. Mr. J. Hill, gardener to Marriage Wallis, Esq., Springfield, Withdeane, third. The class limited to 10 feet by 6 feet produced six entries, the best coming from Mr. Thorpe, 20, West Hill Road, Brighton, a creditable lot; second, Mr. A. Fry, gardener to C. N. Catt, Esq., 52, Middle Street, Brighton.

First-class certificates were awarded to Messrs. Pitcher & Manda for Japanese Chrysanthemums Colonel W. B. Smith and The Tribune, the former a huge flower, golden bronze with terra-cotta suffusion; the latter pale primrose yellow, broad florets. To Mr. Godfrey for Japanese Beauty of Exmouth, and to Mr. Owen, Maidenhead, for incurved Baron Hirsch. There was an admirable display of Grapes and vegetables.

HARDY FRUIT GARDEN.

Planting Fruit Trees.—Few operations are more important than this. Fortunately, however, it need not be hurried over, for although it is desirable to plant early, it is not wise to do so when the soil and the weather are unfit. Nothing is gained by hurrying trees into wet and sticky soil and surrounding their delicate fibres with cold clammy material.

Selecting Trees.—Planters should, if possible, select their own trees at the nursery, giving preference to healthy, clean, sturdy specimens

free from grossness, but which appear to be of medium strength according to their age and form of growth, being in all cases abundantly furnished with fibrous roots. These trees, if carefully removed, are sure to do well. It is particularly necessary that large trees should be provided with abundant roots, in order that fresh root action may quickly take place when removed to new positions. Though trees of any age may be selected, and if removed and replanted with care will succeed, yet to the majority of planters the younger the trees are the better, maidens being usually the best.

Removing Trees.—It is customary with some fruit growers to obtain trees when young and plant them in nursery quarters, from whence they can be easily and promptly transplanted to permanent positions when required. There is little or no difficulty then in affording proper attention to securing all the fibrous roots possible, and seeing that they are not unduly dried by exposure to sun, air, and drying winds. Such trees can be earlier planted than stock obtained from a nursery, as in the latter case the fall of the leaf must be effected before removal can be general. Nurserymen are mostly alive to the importance of protecting the roots, safely securing the branches from injury, and speedy delivery. It therefore rests with the receiver to follow up this careful treatment on the arrival of the trees by quickly laying them in, in moist ground until the immediate moment for planting arrives. Should, however, the roots become unusually dried in transit, they must be moistened before either being temporarily laid in or finally planted.

Planting.—It is best that the ground should have been previously prepared, and become somewhat consolidated; also that any manure required to enrich it incorporated at the same time. November, as a rule, is the best time for planting; but it may, when trees are at hand, be done a short time previously, as well as be deferred to the most favourable opportunities later. Weather exercises a great influence on the work, and may be such as to prevent it entirely on some soils until spring.

Advantages of Early Planting.—The chief advantage of planting early is that the soil contains more warmth, therefore a certain amount of fresh root action can be secured before the resting period. The activity of the sap also in the trees is greater, especially if a few green leaves remain upon them. This root action, little though it may be, together with the rapid healing up or callusing of the ends of shortened roots, has the effect in spring of inducing an early and strong growth, which is generally maintained throughout the season.

Preparing the Trees.—No tree must be planted with injured roots. All such should be carefully cut back to firm portions, using a sharp knife, so that a clean cut is made. Roots with a vertical tendency shorten back closely. Where a number of trees are being planted it would be advisable to make a note of the condition of the roots of each for guidance in the spring, when top growth will require cutting back in proportion for promoting an equal balance between it and the roots.

Method of Planting.—The first essential is to have the holes wide enough but not too deep. The soil in the centre should be slightly higher than the remaining portions, really forming a convex mound. On this firmly place the tree, having in readiness a specially prepared compost consisting chiefly of good loam, but a little pulverised lime rubbish may be mixed with it, also a fair proportion of wood ashes. This material is used to surround the roots, and to aid them in making an active start. As far as possible divide the mass of roots, whether few or many, into layers, between each of which work the compost with a little of the finest of the staple soil. Spread out every root and fibre to its fullest extent, and as horizontal as possible, contriving to finish so that the upper layer of roots will not be more than 3 inches below the surface. Care must also be taken that the bole of the tree is not buried deeper than previously.

Securing the Trees.—At no period of growth do trees require to be held more firmly in position than immediately after planting standards especially. A strong, firmly fixed stake down each side of the stem, fastening the tree to each, will hold it safely in position. Some soft material must be wound round the stem to prevent the ligatures, which may be of strong flexible cord or copper wire, injuring the bark.

Watering and Mulching.—Should the weather prove very dry at the time of planting it may be necessary to water the trees when planted in light soil. This may be left to the judgment of the planter, but whether needed or not it is essential that a layer of fresh, short, l'ttery manure be spread over the soil in a circle round the stem as far as the roots extend. The ground between the trees not occupied with roots may, as operations cease upon it, be manured and neatly dug over.

FRUIT FORCING.

Pines.—As growth advances more or less in these plants during the winter months, and does no harm provided it is effected by natural means, only sufficient artificial heat being employed to sustain the plants in health and maintain the progress made, they should be placed as near to the glass as possible. This will enable them to make the most of every ray of light and sunshine whenever it prevails. Though the plants may not perceptibly grow they store essential matter in spells of bright weather, and become stouter where due attention is given to keep the glass clean, and admitting air when necessary. The sturdy plant throws up a well-formed large fruit in due season, but the drawn weakly plant, though larger in leaf, furnishes a much smaller fruit on a lanky stem at an uncertain and irregular time. Therefore to give plants the benefit of clean glass and proximity to it without touching is to grow with a view to fruit, and to keep them at a considerable distance from the glass and crowded, or beneath glass more or less

opaque through dirt, with its concomitant moister atmosphere, is to produce foliage instead of fruit. The beds of fermenting materials subside considerably through decomposition, and fresh made up ones settle rapidly unless well trodden down. In either case prompt attention should be given to raising the plants so that they have the full benefit of the light, and in so doing take care not to chill or allow them to become overheated at the roots. New beds should be made where necessary. The best plan is to remove all the plants to a structure with the suitable temperature, clear out the old fermenting material, supply fresh, and not return the plants until the beds are in a proper condition. To take Pine plants from a warm house and keep them in a cold place chills them, and returning them to warm beds from cooler quarters acts in the opposite direction, sometimes causing them to "bolt"—that is, throw up fruit prematurely. Oak, Beech, and Spanish Chestnut leaves are much the best, as they are more durable than others, and the heat is consequently milder and lasts longer. Tan, of course, is best where it can be easily secured, and about half the quantity suffices, but leaves in many cases are procurable for nothing beyond the labour.

Assorting the Plants.—It is a good practice to assort the plants according to their respective requirements before winter. If not done earlier, it should be attended to without further delay. Fruiting plants require the best places to swell off the fruits properly, particularly in this season when natural aid is at a minimum. These plants must have a night temperature of 65°, and 70° to 75° by artificial means during the daytime. Succession plants only require a night temperature of 60°, and 65° by day, with an advance from sun heat, but not without air, to 70° to 75°. Young plants must not be brought forward too quickly, because they are not prepared, nor is the winter season an advisable time to cause them to make much growth, and they will progress quite fast enough and satisfactorily in a temperature of 55° to 60° at night, and 60° to 65° in the daytime, above which ventilate freely, taking care to avoid chills. Fruiting plants require moisture at all times, therefore sprinkle available surfaces regularly when they become dry, and in a light house the plants will need sprinkling during bright weather only twice or thrice a week. Successional plants and others will require syringing occasionally and damping available surfaces where the heat is derived solely from hot-water pipes, but where fermenting beds are employed almost enough atmospheric moisture will be secured from that source without having recourse to the syringe.

Cucumbers.—To keep the plants in a healthy fruitful condition the night temperature should be maintained at 65°, 5° more in mild weather and 5° less in the morning when sharp frosty nights occur, 70° to 75° in the daytime by artificial means, advancing to 80° and 85° from sun heat. Whenever the weather is favourable a little air may be admitted at the top of the house, being careful not to lower the temperature or admit a current of cold air, as that dries and cripples the foliage, it being better when the weather is cold to shut off the top heat for an hour or two when the sun is powerful than to admit air when the winds are sharp. The paths and walls will need damping in the morning and afternoon of fine days, but the syringe must not be used to the foliage unless the days are exceptionally bright, and then soon after midday. The water or liquid manure given to the roots must be of the same temperature as the house, as also must the soil given to the beds.

Autumn-fruiting plants are now in full bearing, and having plenty of stamina in them and not being overcropped, will continue to bear good fruit a considerable time longer. It is also necessary to remove the fruit as soon as it becomes a useable size, and all deformed fruit when seen, as these needlessly weaken the plants. Attend to the plants once or twice a week for the removal of bad leaves, stopping irregular and cutting out superfluous growths. If mildew appears dust the affected parts with flowers of sulphur, or form into a paste with skim milk and brush a little on the hot-water pipes; it acts well against red spider and "white fly," but aphides must be subdued by fumigations with the best tobacco paper or the advertised substances, which are generally safer and thoroughly effectual.

Winter-fruiting plants are by far the most difficult to manage. The great thing is to get them well established and furnished with sturdy growths and thick leathery leaves, letting the shoots advance well up the trellis before stopping them, training the side growths evenly, and not more closely than to allow of the foliage being well exposed to light. Stop the side growths after a few good leaves are made, and the growths issuing from the wood left will show plenty of fruit, and such may be stopped one or two joints beyond it. This will secure foliage for accelerating root action and the proper nourishment of the fruit. To insure the fruit swelling it is sometimes necessary to have recourse to fertilising the female flowers, but allow few or no male blossoms or tendrils, removing them as fast as they appear, for they only weaken the plants. Add fresh warmed soil to the ridges or hillocks as the roots protrude, and be careful not to overwater, affording a supply only when needed.

THE FLOWER GARDEN.

Tuberous Begonias.—These were, as usual in most places, left in the beds and borders till frosts cut down the tops, and it is to be hoped the tubers were not injured also. It is a great mistake to wholly clear the latter of soil either now or later on. Enough to fairly hide the tubers should be left on each, this keeping some of the fleshy roots alive, a stronger and sure growth of shoots resulting next spring accordingly. Expose the Begonias as much as possible to all the sunshine and air going; stages and dry beds in borders in freely ventilated vineries being good places for them till the tops are sufficiently dried and decayed to admit of their being cleanly separated from the tubers. Pack them closely together in shallow boxes. If the tubers have been

cleared of earth these should be surrounded by some fresh fine dry soil, but those not so cleared need none of the latter. Tubercous Begonias keep admirably in a dry, warm cellar, and failing this convenience store them in a shed or cool room, taking care to provide a sufficiently heavy covering of mats to exclude frosts. The tubers are far from being hardy, and on the other hand a very warm, dry position may cause their loss by dry rot. Those in pots may be turned out, partly cleared of soil, and wintered as advised in the case of those dug up from the beds; or they may be stored on their sides under a staging in greenhouse where moisture does not reach them. Late-raised plants left thickly in pans or boxes should be kept cool and dry, and the tops when decayed be cleared off them; but the tiny tubers should remain where they are till next spring. They can be grown into strong plants before bedding-out time comes round again.

Dahlias.—In many of the higher positions Dahlias were not injured by frosts before the third week in October, but others suffered very much earlier. All should have been cut down ere this, leaving 9 inches length of stem, the labels being securely attached to this. The tubers should be lightly cleared of soil and laid on their sides in a covered shed for a few days for any moisture there may be to drain out of the stems. Last winter many were killed by frosts, and in order to avoid a repetition of this pack the tubers closely together, distributing fine soil among them, where they can be heavily covered with mats, old carpets, and such like. Under a greenhouse staging is not the proper place, the moisture constantly falling about them either rotting or causing the tubers to start prematurely into growth. Moderately warm sheds and outhouses best suits them, cool dry cellars being a still better storing place.

Other Flower Roots.—Many of the Gladioli, notably those of the more showy Gandavensis type, were very late in flowering this season, frosts cutting them down before their beauty was past. The commoner *G. brenchleyensis* is fairly hardy, and frequently winter well in the open ground, while the *G. Colvillei* should certainly not be disturbed. The rest ought not to be lifted before the tops have lost their greenness, and after the latter have been shortened and the bulbs thoroughly harvested store them in boxes of sand, where frosts cannot reach them. The cormlets often found clustering round the old ones should be taken care of, as these would develop into flowering stuff in the course of one or two more seasons. Store them in sand. The tuberous rooted *Salvia patens* should be treated similarly to Dahlias.

Fuchsias.—These are rightly fast becoming popular in the flower garden, as they relieve the stiffness of ordinary bedding plants. This season they have grown rather more strongly than usual, and many of the plants were flowering very freely when the frosts intervened. Where they were kept in pots and plunged deeply there need not be much difficulty in keeping a portion or all of the stock through the winter. All that is necessary is to keep them in a cool dry house, and to gradually withhold water so as to keep the wood plump. Any lifted and potted will require to be more carefully dried off. Numbers of Fuchsias are annually lost owing to being badly injured by frosts before being housed. While resting unheated sheds and outhouses are too cold for them, but they keep well in vineries and fairly well on their sides under greenhouse stages, only just enough water being given to keep the wood plump. Standard Fuchsias are very effective, and can either be grown from quite young plants or obtained by trimming off the lower branches of some of the roughest of the pyramids next spring.

THE BEE-KEEPER.

APIARIAN NOTES.

THE weather for the past fortnight has been unusually severe for the season. For more than a week the night temperature ranged between 24° and 27°, falling on the evenings of the 25th and 26th to 14° or 18° of frost, with a day temperature of 30°, the highest point it reached. A genial thaw set in on the 27th, and on the 28th the temperature rose from 45° in the morning to 55°, giving a splendid chance for the bees to air themselves. It was the most genial day we have experienced for many weeks.

FLOWERS.

With the exception of Colchicums, all flowers, including a few Wallflowers and Arabis, are completely cut down, so that very little, if any, pollen can be had. Never in all my experience have I witnessed so little pollen gathered during September and October, and never stronger hives, although the majority of them discontinued breeding at the end of July. If strong hives now augur well for the future I am well prepared for 1893.

INTRODUCING A CARNIOLAN QUEEN.

During the severity of the frost an acquaintance asked my assistance to introduce the prettiest golden coloured Carniolan queen I ever saw, that he had just received from Messrs. G. Neighbour & Sons. I had the hive brought to me, and on removing the queen regnant discovered traces of foul brood. I

transferred the bees to clean combs, and as the disease was not widely spread, dispensed with the "purgatorial" process. I managed the transfer and removal of the queen without losing a single bee, and had the satisfaction to see the bees fraternise with the alien stranger and become quite settled. The thermometer stood at 24°. About 8 P.M. I went out to take a last look at them, when, to my horror, the bees were in an uproar, and by the aid of a lantern I discovered more than half of them on the path, apparently dead. I swept them into a shovel, took the hive with the remaining bees within doors, closed the entrance, and dropped the ventilator, a precaution I ought to have done at first. I then placed a rim on the hive, and put the frozen bees upon the top, and covered them; by next morning the whole of them were recuscitated, and joined the cluster, all living. I then liberated the queen, or rather allowed the bees access to her in the cage she was imported in, being well adapted for that purpose after I formed a gateway.

FEEDING.

This had to be resorted to at once as the temperature was low and the bees had no food. I at once fed from the top and the bottom at the same time, the former with a float so constructed that the bees cannot get underneath it, and which falls or rises readily with the sugar, while the latter was a large sized fountain. True to their natural instinct, the bees emptied the fountain several times before they half emptied the upper one, and the longer the feeding continues the less they incline to take syrup overhead. I have experienced the same thing often, and many years ago gave your readers the benefit of it. I have a feeder considerably over a hundred years old, intended, no doubt, for a straw hive for top feeding. It is all wood, and on the same principle as the "Warwick Feeder," which, according to Mr. John M. Hooker, is "The most perfect feeder yet in the market." With some of my combination feeders, or, in other words, feeders for top or bottom, I fed some hives lately at the rate of 14 lbs. of syrup in six hours.—A LANARKSHIRE BEE-KEEPER.

TRADE CATALOGUES RECEIVED.

Diekson & Co., 1, Waterloo Place, Edinburgh.—*Roses, Carnations, Fruit Trees, &c.*

D. S. Thomson & Sons, The Nurseries, Wimbledon.—*Roses, Fruit Trees, Shrubs, &c.*

Hurst & Son, Burbage Nurseries, Hinckley.—*Fruit Trees, Roses, &c.*

*All correspondence should be directed either to "THE EDITOR" or to "THE PUBLISHER." Letters addressed to Dr. Hogg or members of the staff often remain unopened unavoidably. We request that no one will write privately to any of our correspondents, as doing so subjects them to unjustifiable trouble and expense.

Correspondents should not mix up on the same sheet questions relating to Gardening and those on Bee subjects, and should never send more than two or three questions at once. All articles intended for insertion should be written on one side of the paper only. We cannot reply to questions through the post, and we do not undertake to return rejected communications.

Abnormal Gloxinia (W. G. C.)—The floral appendages at the base of the corolla are not by any means uncommon, and we have had flowers sent to us with the character more fully developed than in the one you send; it was however injured in transit.

Mixing Gypsum with Manure for Mushroom Bed (F. H.).—1, It is not desirable to "mix some gypsum with the manure when being prepared for the bed," for, though it absorbs and "fixes" ammonia, it interferes with the fermentation so essential to the spreading of the spawn; the better that is effected the more abundant and prolonged will be the Mushroom crop. 2, The ammonia captured by the gypsum is of no use whatever to the growth and development of the Mushroom spawn, for none of the processes essential to its liberation are undergone in a Mushroom bed. It is different with the "fixed" ammonia when subjected to the secretive action of the roots of growing crops generally, as the "fixed" ammonia must be liberated by the action of the gypsum on certain insoluble compounds of the soil, and having issue in a better supply of potash.

Coloured Plates of Injurious Insects (C. T. H.).—We believe the only standard volume published with coloured figures and descriptions of insect pests is Curtis's "Farm Insects." Of course, it includes some garden ones, necessarily only a part of them. We do not know if it can be obtained now. It was, to the best of our recollection, published by Blackie about 1860, and appeared in parts; we think the volume cost 24s. or 30s. In a catalogue we have is noted a book on "Insects Injurious to Vegetation," with coloured plates, by Harris and Agassiz. It is not stated who is the publisher, nor the price, and we have never seen it. Miss Ormerod's work on "Injurious Insects and Methods of Prevention" has many uncoloured figures, and is useful though deficient on some points, nor does it touch upon the insects of the flower garden. We have not, in fact, any good and popular manual well illustrated which deals with the subject comprehensively.

Apricots Failing Under Glass (A. B.).—Apricots when grown under glass require an abundance of air in spring or when flowering, so as to keep the atmosphere buoyant and dry. This, we think, is the cause of the failure in your case—viz., the house was kept too close, too moist, and at too high a temperature at the time of flowering, which brings on the flowers too quickly, they being then puny, and the blossoms do not set properly nor the fruit swell, because not fertilised. The remedy is to give more air, keeping the house cooler and drier. A few degrees of frost will not injure the blossoms provided they are dry, but it is as well to exclude it, and especially from the embryo fruit, which is very tender. This course of treatment will of course interfere with the Peach trees to some extent, but if you want Apricots they must have air, as a close atmosphere is fatal. Perhaps the tree suffers by want of water at the roots during the resting period. The soil should be kept moist at all times, and care must be taken to have it thoroughly so when the buds are swelling and onward throughout the period of growth.

Tomatoes and Peaches in the Same House (J. A.).—Tomatoes will not thrive beneath Peach trees, nor the latter prove satisfactory when shaded by the former, yet they succeed fairly well together when given a chance. It would be better to have a lean-to than a three-quarters span-roofed house, raising the back wall as you propose. The Peach trees may be grown against the wall, preferably training them to a trellis, or wires fixed horizontally about 6 inches apart, and just clear of the wall. The Tomatoes should be planted crosswise of the house and trained upright to stakes or an improvised lath trellis, allowing sufficient space between the plants for a person to pass freely for watering and other cultural purposes. There must be 4 feet clear between the stems of the Tomatoes and the back wall. By this method the roof is kept clear, and both the Tomatoes and Peaches receive the light essential to free bearing and the ripening of the crops. There is another point, namely, the temperature; and the ventilation must be such as suits the Peach trees, for they will not accord to the conditions frequently given Tomatoes in the early stages of their growth.

Precipitated Carbonate of Copper (S. S.).—We are not aware that precipitated copper carbonate is kept in stock by chemists, and it is best to manufacture it at home. Procure 3 lbs. of copper sulphate, and dissolve it in hot water in a tub. In another vessel dissolve 3½ lbs. of washing soda in hot water. When cool pour the soda solution slowly into the copper solution, then add water until the tub is full. Stir the solution thoroughly and let it stand twenty-four hours, then syphon off the clear liquid and add fresh water. Stir again and allow the solution to stand twenty-four hours, syphon off the clear liquid as before, then remove and dry the sediment, which is carbonate of copper. The half of a petroleum cask answers very well for precipitating the copper, and a syphon is easily formed of half-inch garden hose. There will be 1 to 1½ lb. of copper carbonate. The liquid ammonia, strength 26°, may be procured of any chemist. Where there is little use for an instrument to apply fungicides and insecticides, a syringe specially made for spraying answers very well; but they are much more quickly distributed by a knapsack pump, and, as a rule, in a better manner. As a syringe "Stott's" for spraying is efficient. Snow's Patent Garden Pump combines simplicity with usefulness, and is a necessity for outdoor use or under glass. M. Vermorel's French Knapsack Pump "Eclair" has proved satisfactory wherever used.

Names of Fruits.—Notice.—Special attention is directed to the following decision, the object of which is to discourage the growth of inferior and promote the culture of superior varieties. In consequence of the large number of worthless Apples and Pears sent to this office to be named, it has been decided to name only specimens and varieties of approved merit, and to reject the inferior, which are not worth sending or growing. The names and addresses of senders of fruit to be named must in all cases be enclosed with the specimens, whether letters referring to the fruit are sent by post or not. The names are not necessarily required for publication, initials sufficing for that. Only six specimens can be named at once, and any beyond that number cannot be preserved. (T. Watkins).—1, Ross Nonpareil; 2, Probably local. (J. R.).—1, Beurré d'Amanlis; 2, Swan's Egg; 3, Golden Winter Pearmain; 4, Lord Grosvenor; 5, Yorkshire Greening; 6, Round Winter Nonesuch. (G. Parrant).—1, Forelle; 5, Reinette de Caux. (J. Q.).—1, Court of Wick; 2, Potts' Seedling; 3, Striped Beefing. (D.).—1, Beauty of Hants; 2, Sops in Wine; 4, Gravenstein. (A. J. L.).—1, Tyler's Kernel; 2, Striped Beefing; 3, Scarlet Pearmain; 4, Court of Wick. (R. M.).—The large specimens are both Warner's King. That named Winter Peach is not that variety, but is probably a seedling. (S. S.).—The large Apples are Rymer, the small Court of Wick. (Herbert).—1 and 2, Passe Colmar; 3, Marie Louise d'Uccle; 4, Pit-

maston Duchess; 5, Beurre Langelier; 6, General Todleben. (Nemo).—The Pear is Catillac; 1 and 2, King of the Pippins, the difference, if any, probably due to stock influence; 3, Old Hawthornden. (R. C. W.).—1, Alfriston; 2, Reinette de Caux; 1, Pear Comte de Flandres; 2, Belle Julie; 3, Seckle; 4, Nouveau Poiteau. (Captain Daubeny).—1, Striped Beefing; 2, not Lady's Finger; 3, Foxwhelp; 4, Golden Reinette. (F. A. J. E.).—We do not recognise any of these as British Apples. They are probably French. (H. E. Monro).—1, Ashmead's Kernel; 2, Doyenné du Comice; 3, Golden Reinette; 4, King of the Pippins; 5, Striped Beefing; 6, Dumelow's Seedling. (W. M.).—Not identified; probably local. (Hurst & Son).—1, Besspool; 2, Queen Caroline; 3, worthless; 4, Doyenné Boussoch; 5 and 6, not sufficient for identification. (J. D.).—1, Possibly Gros Colman; 2, Mrs. Pince; but you ought to have sent leaves. (A. G.).—Grapes can only be named when a fair representative bunch is sent, a leaf, and some particulars as to the manner of growth. The berries sent were smashed to a pulp.

Names of Plants.—We only undertake to name species of plants, not varieties that have originated from seed and termed florists' flowers. Flowering specimens are necessary of flowering plants, and Fern fronds should bear spores. Specimens should arrive in a fresh state in firm boxes. Slightly damp moss, soft green grass or leaves form the best packing, dry wool the worst. Not more than six specimens can be named at once, and the numbers should be visible without untying the ligatures, it being often difficult to separate them when the paper is damp. (A. G.).—1, Psychotria jasminiflora; 5, Bambusa Fortunei. (H. R.).—1, Adiantum tenerum; 2, Pteris serrulata cristata; 3, P. cretica, albolineata; 4, Gymnogramma chrysophylla; 5, Adiantum amabile; 6 Pteris umbrosa cristata. (G. P.).—Orchid, Vanda insignis.

COVENT GARDEN MARKET.—NOVEMBER 2ND.

NO alteration. Market very dull.

THE DAIRY.

DERBYSHIRE farmers complain bitterly of heavy losses sustained in the milk trade. Cheddar cheese makers say that owing to a short crop of grass the yield of cheese is so low that

the deficiency will be fully 1 cwt. per cow. But Stilton cheese makers have done exceedingly well, prices rule high, being quite up to the average, as also is the number of cheese. This, at any rate, is the case at the largest farm of a Leicestershire estate; some of the smaller tenants may not have done quite so well, but on the whole they are thriving, and we have no notices for leaving holdings next Ladyday arising out of failure or business difficulties. "Nothing," says a report of the recent Dairy Show at Islington, "can approach the rich flavour of a well-made Stilton. Even Frenchmen admit as much." So that the thriving condition of makers of this cheese must be taken apart from the general question.

Very serious indeed is the state of things, if, as we are assured, town milk dealers mix separated milk with new milk without risk of detection, their profits upon the separated milk so used being at least cent per cent. In the Peak district practically the whole of the land is devoted to grazing, the holdings being below rather than above an average of 50 acres. We recently saw from thirty to forty milk carts at Miller's Dale station, each with three or four churns of milk for the Manchester dealers. The scene was animated with a brisk business-like air about it. There was no loitering, the carts being quickly unloaded, the milk delivered, empty cans collected, and the carts driven off again to the quiet solitary homes of the graziers amongst the neighbouring hills and dales. If such men are suffering from falling prices, as they say they are, who is to help them? To talk to them of butter factories would, upon the surface, seem a mere mockery. Yet their case is not so bad as was that of Munster farmers in Ireland before they set themselves to establish co-operative butter factories. With the advent of such factories came prosperity with a future to it, and not a mere fitful thing of the moment. Good butter is still very scarce, difficult to obtain, always being bought up quickly whenever it can be had, even in small quantities. We know a farm in Leicestershire where as much as 1s. 7d. per pound was obtained for all that could be made early in autumn, the whole of the milk being devoted to it in preference to cheese, simply because it was found to be so profitable. There is nothing particularly favourable to the production of good butter in the land of the farm, for that is poor, and is badly cultivated; the cows too are decidedly inferior animals, but it is just owing to the farmer's wife being so cleanly and skilful. That is the point: given the necessary skill in dairy management, with pure wholesome food for the cows, there is no insuperable difficulty in the production of good butter.

What the dalesmen want is a leader in whom they have sufficient confidence to induce them to unite to establish factories. There is much ignorance about this matter among influential men, who are holding meetings to discuss the situation and the possibility of doing better. "What!" say they, "graziers establish butter factories! Where is the money to come from?" "Shares of £1 per cow; calls of 2s. or 3s. per share, as money is required; prompt payments for milk, according to quality; half-yearly dividends for the shareholders," is the answer which results in Ireland justify.

We question if the serious depression in other things besides agriculture is fully realised. Taking the district we have mentioned there must be much distress from the serious decline of the weaving and lace trade. At Bradwell there appears little to do besides miking and stone-breaking. In Bradwell Dale there are two defunct lead mines; at Tideswell the silk looms are almost all at a standstill; at Draycott a huge lace factory is empty and silent. Any possible restoration of prosperity rests with agriculture. It will come as technical education makes its way. We say this with confidence, for our work in connection with this movement takes us much among the dalesmen. We find them intelligent, earnest, eager for information, very energetic, and we are convinced that when

they once come to realise fully the advantages and possibilities of factories all minor difficulties will be swept away. In what is before all things a dairy country, it is lamentable that the milk trade pure and simple should absorb so much of the produce, to the loss of the producers. By all means continue and extend the milk trade, but let it be with factories for butter and cheese rather than for town consumption.

In conjunction with this we are bound to strive for improvement in dairy cows; for real cultivation of pastures, which is a very different process to the slipshod practice of throwing cow droppings about the pasture as a manure dressing. The absurdity of the thing is so apparent that those who do it must surely realise how futile these efforts are to produce anything like adequate results.

WORK ON THE HOME FARM.

Two meadows on an upland farm are in such an unsatisfactory condition that the landlord has requested us to take them in hand in view of seeing whether they can be improved to his advantage and that of his tenant. This particular instance of poverty is all the more vexatious, because the meadows adjoining them are really good pasture. The first step will be taken at once by making drains 7 yards apart and about 30 inches deep; there are then two ways open to impart fertility to the land, which is evidently very poor. The first is by sheep-folding at once, the second by dressing with chemical manure next February. As we shall have to adopt the latter course a strip of surface will be left undressed to show exactly the degree of improvement. With tenants unable or unwilling to incur the expense of manures, the only course open to the owner of the land to improve it in as expeditious and reasonable a manner as possible, and to render it worth while for the tenant to cling to the holding and to pay a fair interest upon the landlord's outlay.

Without doing the drainage, which we know to be so necessary, it would be mere waste of money to apply manure. We must have thorough water filtration through soil if we would have prompt action of manure. The two things are inseparable. It is for this reason that we call attention to the importance of making new drains and repairing old ones as soon as the pressure of autumn tillage is over. Get the water out of the land, store it with plant food, and you will have full crops. Rest content with nothing short of this; it is very simple, and is so entirely worth while. See that all water furrows in every ploughed field, whether sown with corn or not, have the ends well opened into the nearest ditch so as to carry off water quickly.

Fold draft ewes on grass now, using an hurdle to a sheep, shutting them in at dusk, with some food in troughs, and letting them out by day. Two nights should suffice for each fold, and much good work is quietly done in this manner on uplands and hill farms. We do not advise folding in cold damp valleys, or wet land at this season of the year. Hill farmers should turn sheep to much better account than they do, keeping them in folds whenever it can be managed, always bearing in mind that we have no better means both for efficiency and economy of storing soil with fertility.

REMARKS.

- 23rd.—Almost cloudless throughout.
 24th.—Bright sunshine till 2 P.M., then generally cloudy.
 25th.—Overcast, with occasional drizzle in the morning; showery from noon to 3.30 P.M., then fair again, and bright night.
 26th.—Sunny, with halo in morning; fine afternoon and night.
 27th.—Overcast, with a little rain early; wet from 10 A.M. to 7.30 P.M., and from 9 to 11 P.M.
 28th.—Mild and dull, with frequent slight rain early; incessant rain from 11.30 A.M. to 8 P.M., and showers after.
 29th.—Mild and unsettled, with occasional sunshine early; showers at 11.30 A.M., and noon; almost continuous bright sunshine after 1 P.M.
 A variable week, cool and rain nearly every day.—G. J. SYMONS.

ECONOMY has been the order of the day in many private gardens of late years, and to all appearances it is likely to be for some time to come. Extravagance I have never been an advocate for, and think that it behoves gardeners not only to avoid this, but also to be as economical as they can in all their arrangements where the pockets of their employers are concerned. There is, however, such a thing as false economy. What at first sight may appear a saving frequently turns out to be quite the reverse in the long run, and in no instance is the truth of this assertion more forcibly exemplified than in the matter of planting fruit trees. Because the existing trees appear to be in fairly good health, no great blanks being noticeable either in the case of trees under glass, against open walls, or in gardens and orchards, the owner jumps at the conclusion that no planting of young trees will be necessary for some time to come, and gives orders accordingly. In many gardens after the trees have attained a certain size and age they rapidly decline in vigour and productiveness; at all events, the quality of the fruit produced is very second rate, while in some instances the collapse is even more rapid, large limbs dying off wholesale. If, for the sake of a present saving of a few shillings or pounds, we delay planting young trees till the old ones are nearly or quite worthless, we soon have unsightly blanks staring us in the face, and the mis-use of so much valuable house, wall, and garden space is only too evident in the fruit room when the autumn comes round, to say nothing of various shortcomings earlier in the season.

Another phase of false economy is, as a rule, confined to the owners of small gardens, those who employ experienced gardeners being usually and rightly guided by the opinions of the latter. I refer to the common practice of purchasing cheap trees. I have seen whole rows of fruit trees, named or otherwise, eagerly bought at auction sales simply because they "went cheap." When nurseries are managed by men verging on bankruptcy transplanting is rarely carried out, and not a few of those cheap trees have not been moved for years. They crowd each other with branches and overrun each other at the roots; consequently, when they come to be lifted they move very badly, and are years before they recover their vigour, if ever they do. In numbers of cases the names are lost, or, if they are preserved, the varieties are almost certain to be comparatively worthless, being those for which few or no orders are ever received. Thousands of this class of trees, and also many really well-grown trees of varieties for which the nurserymen cannot find any other means of getting rid of, annually find their way to provincial market towns, and are sold by auction on market days. They find purchasers at what appear to be ridiculously low figures, but I hold such trees to be dear at a gift. Only last winter I saw grand pyramid Apple and Pear trees sold in a market place for less than 1s. each, which, if the varieties had been good, would have been cheap at 3s. each. Please bear in mind that I am not a nursery salesman, or in the least interested in their prosperity, beyond wishing that all who do business in an honest manner may meet with the success they deserve. If anyone can prove there is any economy in buying trees after they have been knocking about with their previously damaged roots exposed for several days in succession to cold frosty winds, then I am no judge in the matter.

In one garden that comes under my notice frequently a large number of cheap standard Apple trees, presumably of superior varieties, proved to be nothing more than cider fruit. All have been regrafted, and are now doing well; but what a waste of time and space took place before they commenced to pay their way. Better by far have bought a number of Crab stocks outright, and grafted these. My advice, therefore, to intending planters is never to be misled either by appearances or the descriptions given of trees and varieties that are vended by perfect strangers. There are trustworthy nurserymen within easy distance of most localities, while those who advertise will not, as a rule, risk their reputation by supplying what they know to be worthless.

True economy, then, consists not only in keeping a garden well stocked with fruit trees, but also in paying a fair price for a good article. It may be asked, What is a good article? I think the answer to this is not far to seek. As I have already pointed out, it is not the largest and most perfectly formed trees that are always the most desirable for planting. What is wanted are medium-sized to small trees of the most approved varieties. Of late years there has been such a great demand for the latter that it is next to impossible to obtain large trees of them, whereas the shy bearers and inferior varieties are on hand far longer than their growers care to see them. Those who want trees should decide beforehand what they intend to plant, or else seek the advice of some competent person, and, if the orders are placed early, buyers are fully justified in insisting that they have what they want. In some instances the selections might safely be left to the nurseryman receiving the order, but according to my experience "substituted" trees are not a success, and of late years I have insisted upon having exactly what I ordered.

It is also a wrong notion to plant many varieties of any one kind of fruit. From a pomologist's point of view unlimited collections are very interesting and instructive, but they are far from being economical. For instance, sixty trees of as many varieties of either Apples or Pears, are not half so profitable and satisfactory in other ways as a dozen varieties well selected, five trees of each, would be, and the same rule holds good with other kinds of fruit. It is the limited collections that best please the owners of private gardens, and are decidedly the most profitable for market growers. It may be somewhat against the grain to have to plant small trees of the most sought after varieties, but it will be found that healthy young plants, if not the first to arrive at a free-bearing state, eventually develop into the best or most profitable trees.—M. H.

AZALEA MOLLIS.

THIS Azalea is recognised in all botanical works as *A. sinensis*, but gardeners generally know it by its more popular title of *A. mollis*. Though the species *A. sinensis* has been introduced in this country since 1823, it is only during recent years that we have heard so much about the hybrids, for the hybridist has been busy here. If he has not secured the brilliant colours that are seen in the Indian types, he has at least produced such delicate tints that are quite unknown to the other classes. In this respect the Azaleas resemble the Tea Roses. The Belgian growers have introduced many of the best varieties, but it is a cogent fact that thousands of seedlings are raised annually in this country. I think that they are more serviceable to a gardener than the varieties of *A. indica*, though they do not equal them in all respects. For instance, we do not possess a really pure white variety yet, though this is only a question of time, for there is plenty of material to work upon. The fact that the plants are perfectly hardy is sufficient to recommend them anywhere; but when we consider how useful they are for conservatory decoration in early spring, their claims are doubly enhanced.

If we first consider the Azaleas as being hardy, we shall soon

arrive at the best methods for utilising them. I think it will be generally admitted that our shrubberies are too scantily supplied with flowering shrubs. If such plants as these were introduced more freely, the effect in spring would be charming. For small gardens a single bush would be sufficient to make an effect, but where long borders of evergreens are planted, a group of at least a dozen plants should be introduced. If a little regard is paid to the colours, such groups cannot be other than striking during the flowering season. In most places a bed could be planted on the lawn without deranging the surroundings. I readily admit these beds are not very pretty during the winter months, but, at any rate, they are as presentable as those containing Roses. I have a bed in my mind's eye at the present time that makes quite an exhibition each year. I would also advise planting single standards, just as we do Roses or Rhododendrons. I know nurseries where large stocks of these are always kept on hand, and very beautiful they look in the spring. Soils that will grow Rhododendrons successfully will suit *A. mollis* equally well. The soil to be avoided, or rather made good, is a cold heavy clay, but such can soon be improved by the means known to every reader of the *Journal*.

I should like also to draw attention to the Azaleas for the greenhouse or conservatory decoration. I am convinced that if their merits were more universally known we should meet them more often. We do hear of failures in their culture, but it is generally through some irrational treatment. It is very unwise to force them hard the first season after they are potted, for the flowers invariably fail to develop properly. Why they refuse to start can be readily explained. The simple fact that they are not established is sufficient to account for any such evils. The first year I prefer to let them expand in a greenhouse. It is sheer waste of time to bundle them together in a cold greenhouse after they have finished flowering as we generally do Lilacs, Rhododendron ponticum, and similar things, for they will never succeed unless they get proper culture. It is essential that they get a good sunny position during the summer to mature the growth properly. The flowers are very suitable for decorative purposes where they can be cut from the plants and taken to the rooms at once. Owing to the delicacy of the petals they do not travel very well, the least bruising spoiling their appearance. Named varieties, in colours ranging from creamy white to a deep dull red with all the intervening shades, can be purchased. Personally, however, I like the seedlings, for they grow more vigorously, and there is really very little to choose between them.—JAS. B. RIDING.

DISCUSSION ON APPLES.

CELLINI.

I SEND you a sample of the above Apple from a young tree planted three years ago on ground that has been reclaimed from the sea. The land, which was formerly part of Brading Harbour, has been reclaimed about eleven years, but still contains a large percentage of salt and phosphates from the sea. I planted three Apple trees as an experiment, and the Cellini being one of my favourites, I thought I would try it. Last year it produced about two dozen fruits, and this year quite half a bushel, of which the enclosed are some of the finest. The colour is extra rich, even for this variety, reminding one of the Tasmanian Apples that were exhibited at the R.H.S. some few years ago. The tree is now about 4 feet high to the bearing wood, and is planted in a light sandy soil. This may interest Mr. Brotherton and "E. M." The variety did very well with me on a rather heavy soil at Kingston, and it seems to be doing equally as well on light land here, only the fruit is so much more highly coloured. I planted about fifty others of different varieties last spring, and it will be interesting to note how they succeed.—C. ORCHARD, *Bembridge, Isle of Wight*.

[The Apples referred to are very fine indeed, and unusually rich and bright in colour.]

NELSON'S CODLIN.

I NOTICED that mention was made of this variety last week. It is one of the best kitchen Apples that obtains little notice. I had a tree of it at Bedford, where on the stiff clay it did wonderfully well, but never became a large specimen. It seems adapted for small gardens. The branches assume, if allowed to make free growth, a somewhat drooping habit. The fruits are of a large, clean, conical form, exactly like those of Lord Suffield, and I have always held that Nelson's Codlin must have been one of the parents of that fine early variety. It is, however, later, and has firmer flesh. The bloom is large, and has deep rich colour. The variety will make a handsome lawn tree. Nelson's Codlin belongs to the

Mank's Codlin and Old Hawthornden section of trees. Early Julyan and Frogmore Prolific also belong to the same class; indeed, there may be a dozen good varieties that can specially be commended for their free productiveness, and yet always make moderate short-jointed growth.—A. D.

COCKLE'S PIPPIN.

WERE this introduced now as a new Apple and fruits presented for criticism at Christmas, we should unhesitatingly give it a first-class certificate. The variety is not a robust grower, but it is a free cropper. It is not a showy Apple, as it never puts on colour, but its flesh is crisp and it has a delicious flavour, not inaptly termed balsamic. I cannot admit that in selecting the best half dozen of dessert varieties for keeping, even including Cox's Orange Pippin, Ribston Pippin, Cornish Gilliflower, Pitmaston Golden Pippin, and Claygate Pearmain, that we ought to omit Cackle's Pippin. The rage for big and showy Apples is likely to elbow out the humbler looking russetty dessert varieties that have the best flavour unless their merits are well kept in view.—A. D.

DUCHESS OF OLDENBURG.

ONCE more this variety fully maintained its reputation for being a consistent and sure bearer. Last year the branches on our half-standard were weighted down to the ground with fruit, and this season the crop was quite as heavy and the fruit considerably larger. Towards the middle of August the fruit began to assume a somewhat transparent appearance (it is sometimes erroneously termed the Russian Transparent), and if not exactly a good dessert Apple, either then or later being somewhat acid, there is no mistake about its good cooking qualities. The fruits are large, well-formed, greenish yellow on the shaded side, and beautifully striped with red where exposed, altogether presenting a decidedly attractive appearance. This season Duchess of Oldenburg, in common with many varieties, kept badly, all being past their best by the end of the first week in September, but in former years it has kept good till near the end of that month. Our soil is a strong clayey loam, and the tree is on the Crab stock. That the merits of this variety have been fully appreciated by many market growers was very evident late last August. Apparently it was the only Apple that could be offered for dessert purposes by most of the fruiterers in the outlying parts of London, and, in fact, but few other varieties were to be seen. Being available for either dessert or culinary purposes, and more generally reliable than any member of the Codlin family, Duchess of Oldenburg should, and most probably will, oust a good many of these.—W. I.

LORD SUFFIELD.

IN this district one of the best and most prolific Apples is Lord Suffield. Although with many varieties the present season is a poor one, trees of the above have been loaded with fruit. Last year, owing to the late and severe frost at Whitsuntide, the blossoms suffered very much, and the result was a failure of the crop, but this season they escaped. One tree in an amateur's garden of my acquaintance produced 50 lbs. of fruit, four trees giving in bulk 160 lbs. The soil is fairly strong loam, resting on a sandy kind of clayey subsoil, which, being on a hill side in an elevated district, is naturally well drained. The trees have not been pruned for years, nor yet has any support been given to the roots. They have long grown as they liked, and luckily so far an equal balance between root and branch has been maintained. The appearance, however, of the trees indicates that the roots are descending into the subsoil, as some of the trees, instead of having a spreading habit, are lengthening out in a strong manner upwards, producing long-jointed wood. So long as the trees can blossom and bear fruit this strong tendency will be sufficiently checked to divert the sap into the formation of fruit buds. It is possible, however, that the roots will eventually gain too strong a hold for the trees to do this.—E. D. S., *Sheffield*.

WALTHAM ABBEY SEEDLING.

WHAT is the difference between Waltham Abbey Seedling, so highly spoken of by "A. D.," and Dr. Harvey, also Wormsley Pippin? The difference, if any, is very slight. It is a splendid Apple.—A. B.

UNCTUOUS APPLES.

CERTAIN Apples, it is well known, are unctuous, and sometimes this unctuousness is very pronounced. In my own garden the Welford Park Nonesuch is by far the most unctuous of all the Apples grown; but Mr. Charles Ross, the raiser of the Apple, to whom I communicated this fact, has informed me that it is not so with him. Can any of your readers furnish information on this subject?—G. M. S., *Tillington*.

CATTLEYA LEUCOGLOSSA.

THIS beautiful hybrid was exhibited by Messrs. J. Veitch and Sons, Royal Exotic Nursery, Chelsea, at the meeting of the Royal Horticultural Society on November 1st, and a first-class certificate was awarded it. As briefly announced in our last issue, it is a cross between *C. Loddigesi* and *C. fausta*, the latter parent being also a hybrid between the former and *Laelia exoniensis*. *C. leucoglossa* was raised by Mr. Seden, Messrs. Veitch's grower. The first seedling from this cross flowered in 1888, but the plant shown at the Drill Hall last week, and from a flower of which our illustration (fig. 56) was prepared, is blooming now for the first time. There is a resemblance of both parents in this interesting hybrid, but the sepals and petals possess a clearer shade than does *C. Loddigesi*. The lip is of a charming rose colour with a white crested edge and a suffusion of yellow in the throat.

PLEIONES.

THESE very desirable little bulbous plants are flowering most profusely here at the present time, and I think that a few remarks respecting their culture would not be out of place. Much has been said respecting the most suitable compost for them; some growers advise using fibry loam, peat, cow manure and silver sand, while others recommend good fibry peat only. I have tried both ways and am decidedly in favour of the latter practice. I grew them during 1890 and 1891 in the former compost, and the result was I had scarcely any flowers at all, whereas this year I have used nothing but good fibry peat and have obtained a good display of blooms. *Pleione Lagaria* is carrying two, and on some bulbs four flowers each. To further prove that fibry peat only is the most suitable compost for them I may say that *Pleione maculata*, which did not produce one flower in the former compost, is this year flowering profusely.

Great care must be exercised not to pot the bulbs too deeply, the better plan being to raise the soil in the centre of the pots or pans, thereby enabling the water to pass more readily away. As the flower scapes are produced from the under side of the bulbs, if potted too deeply they are liable to damp off before they arrive at perfection. *Pleiones* should never be allowed to suffer through want of water at any season, for unlike the majority of Orchidaceous plants they do not require a period of rest, for as soon as the flowers are over the foliage begins to appear, at which stage it is the best and proper time to repot them. It is very essential that plenty of drainage should be afforded them, half filling the pots or pans would not be any too much. I use pans in preference to pots, as a better display can be thus produced. The flowers should never be cut, as by so doing you are very liable to injure the foliage also, as it is produced from the same scape as the flower. I have known cases where the flowers were cut as they began to fade, and the consequence has been that the tips of the leaves are also taken off, thereby rendering the plants unsightly for the remainder of the season.—GEO. PARRANT, *Ashby Lodge Gardens, near Rugby*.

SOPHRONITIS.

WHEN Dr. Lindley founded this genus he evidently had no expectations of such a species as *S. grandiflora*, or no doubt its brilliant colouring would have suggested some other than the "modest" generic name now well known.

S. cernua is a small close-habited plant with small pseudo-bulbs surmounted by a single dark green leaf. The flowers are produced during the winter. They are produced two to six on a short spike; the sepals and petals are bright red, and the lip is yellow. This species was discovered by W. Harrison, Esq., near Rio Janeiro, in 1826, and was sent by him to Mrs. Harrison at Aigburth, where it flowered in December of that year. There is a figure in the "Botanical Register," t. 1129, named *Sophronia cernua*.

S. grandiflora.—This is an extremely useful plant, flowering during the late autumn and winter. It requires a cool house temperature, and should be grown in peat and sphagnum in shallow pans suspended near the glass. It is by far the finest species of this small genus. The flowers last a long time in water, and are well suited for buttonhole bouquets. *S. grandiflora* was introduced by a Mr. Gardner, who discovered it on the Organ Mountains in Brazil and sent it home in 1837. It was found growing on the branches of trees at an elevation where in the winter time white frosts occurred every morning. This proves its hardiness, and it is curious to note that when *Sophronites* were first cultivated they were grown in stove heat. The pseudo-bulbs are egg-shaped, 1 inch long. The leaves are leathery, deep green, 2 or 3 inches in length. The scapes are produced from the bases of the bulbs, and each carries a solitary flower varying from 1½ to 4 inches across. The sepals and petals are broad and full, bright scarlet; the lip is small and narrow, yellowish with scarlet markings. I remember about three years ago seeing a row of well-flowered plants of *S. grandiflora* alternating with pans of *Odont. Rossi majus* suspended in one of the cool Orchid houses at Messrs. Veitch's Chelsea nursery, which were greatly admired. *S. grandiflora* was originally described by Dr. Lindley as *Cattleya coccinea*. There

FIG. 56. - CATTLEYA LEUCOGLOSSA.

are at least two varieties of *S. grandiflora*, one with reddish purple flowers, *S. g. var. purpurea*, and one with rose-coloured flowers, *S. g. var. rosea*; both of these seem to be smaller in all parts than the type.

S. violacea.—This species was discovered by Gardner at the same time as *S. grandiflora*, and is a pretty little plant with egg-shaped pseudo-bulbs, 1 inch long. The leaves are narrow, and about 2 inches long. The flowers are produced either singly or in pairs on short peduncles. Each flower is about 1 inch across, the colour is violet-magenta with a paler centre.—C. K.

A GOOD DRESSING OF LIME.

I HAVE pleasure in replying to the Editorial note under the head of "Potato Disease" (page 354). The question, however, is not so easily answered as would at first appear. The nature of the soil and its condition must be the entire guide in liming. I have used from 15 to 20 tons on an acre of ground, and although I had only a poor idea in those days what a good liming constituted, it proved the salvation of a garden that had been declared by two individuals to be worn out. The garden, however, produced marvellous crops for a period of twelve years, and I care is doing so still.

On heavy tenacious soil, and on peat soils that have become sour by the accumulation of vegetable acids, I shall advise the use of $1\frac{1}{2}$ cwt. on each rod, or say ten tons per acre. On loams inclining to be heavy and having been heavily manured 1 cwt. per rod, or 8 tons per acre. On soils inclining to be sandy I should use from $\frac{1}{2}$ to $\frac{3}{4}$ cwt. on each rod, or from 4 to 6 tons per acre. Judgment is needed in this matter, and the quantity advised ought to be varied according to the texture of the soil and its condition generally.

If I used gas lime, which I dislike very much indeed, I should not apply more than a quarter to half a cwt. per rod. This lime needs very careful spreading on the soil some considerable time before the ground is cropped. If I was tied to the use of gas lime I should mix it with the scrapings of roads, and the edging of walks; in fact, form a compost heap of any material I could get, and let it lay for twelve months or so, after which it may be thoroughly mixed and applied to the land in early autumn.—WM. BARDNEY.

FRUIT IN THE LORD MAYOR'S SHOW.

THERE is more truth in the old saying that "familiarity breeds contempt" than there is in most of the threadbare and weather-worn aphorisms with which those who have not wit enough to devise any original wisdom hide the barrenness of the mental land. This paves the way for saying that even so venerable a function as the Lord Mayor's procession on the 9th of November has come to be regarded with ill-concealed disfavour to most Fleet Streeters; and at the *Journal* office in particular, where the course of business in the height of the Chrysanthemum season has often been interfered with by the civic pageant. This year, however, all was changed. The venerable chief smiled even more benignantly than usual; the manager moved about with more than his wonted briskness; a busy staff forgot to grumble about their work being interfered with, which, considering their avidity for it, was very significant; and the printing staff in general betrayed a distinct interest in what was going on, while words failed to describe the condition of the office boys. In a word, 171 was not itself on Lord Mayor's day. What was the explanation? It was the announcement that a car of fruit was going to form a part of the great procession for the first time in history. If it had been possible to divine the innermost thoughts of the staff, it would have been found that each and all was sensible that the *Journal* felt it could justly lay claim to some share in the work that had led to the innovation taking place, and felt a personal interest in the show for the first out of the many times it had passed beneath the office walls.

A happier idea than that of arranging for such a display could not have occurred in connection with the great festival. Public interest in home-grown fruit has grown, and is still growing; the populace could hardly, therefore, fail to be pleased at having a magnificent trophy paraded before it. That pleasure was experienced the volleys of cheers all along the line showed plainly. The fruit looked so tempting that it is hard to estimate the magnitude of the scramble which would have taken place had a breakdown occurred. The crowd, however, found appreciation without an opportunity of experimenting, and expressed their sentiments at seeing a great trophy of British fruits passing through London streets in the true old British style. The Fruiterers' Company made excellent arrangements for carrying out the project in an efficient manner, and placed the work in the capable hands of Mr. George Bunyard. The noble edifice of fruit built up was a complete justification of their choice. At one end of the car was a set of trees in pots, and at the other espalier-trained specimens, all well furnished with handsome fruits. At the side of the central stage were cordon trees. The main portion of the trophy consisted of thirty-six baskets of splendid fruit, the Apples comprising such richly coloured varieties as Worcester Pearmain, Gascoigne's Seedling, and Bismarck, while Stirling Castle, Warner's King, Peasgood's Nonesuch, Pott's Seedling, Blenheim, and King of the Pippins were noticeable, together with Pitmaston Duchess, Beurré de Capiaumont, and other Pears. These were arranged in two sloping banks, and were surmounted by growing Pine Apples and some baskets of splendid Grapes. Apart from these there were four corner standards entwined with *Pyracantha* berries, Clematis, and Brambles, and strings of berries and foliage depending from them. Two mottos, "God Giveth Increase," and "Britain Can Grow Her Own Fruit," were conspicuous on the side drapery. Corner scrolls gave the names of the four counties growing the most fruit—namely, Herefordshire, Worcester, Devon, and Kent, and a gilded upper piece lent finish to the work. It is pleasant to record that a brother fruiterer in Mr. Joseph Cheal of Crawley, willingly lent valuable assistance with fruit in arranging the trophy.

It was a credit to all concerned—to the Fruiterers' Company, which, headed by Sir James Whitehead, Bart., M.P., has done so much for British fruit growing during the last two or three years; to Mr. Bunyard and his assistants; last and greatest to the country which produced it.

TRAINED FRUIT TREES.

THOUGH the art of training fruit trees is not carried to such elaborate extremes in this country as it is on the continent one has only to enter a few of the leading fruit nurseries to recognise that the main principles are thoroughly familiar to us. The British trainers are not all Jamins, but they know their work well nevertheless, and I venture to think that if the illustrious French horticulturist named were to visit the metropolitan nursery of Messrs. Veitch & Sons at Southfields, Fulham, he would accord ready appreciation of the splendid mass of material in the way of trained trees which is there discoverable. There is something of special interest in this phase of fruit culture. Valuable as are the ordinary trees and bushes for planting in the open, both in gardens and market establishments, there are thousands of places in which wall and espalier trees can be usefully and profitably utilised. In every well appointed garden of any pretensions they have their allotted positions, and in smaller gardens, such as those of amateurs and cottagers, they might be planted with hope of a valuable return. I am told that in Oxfordshire there are several instances of Apricots being grown so successfully on cottage walls that the fruit pays the rent, and there is no doubt whatever that many square miles of wall surface go bare which might be made to produce in the aggregate many tons of delicious and wholesome fruit.

THE LOST ART OF PEACH GROWING.

Notwithstanding many striking examples to the contrary, Peach growing in the open air appears to be a lost art to the majority of cultivators. There are comparatively few gardens in which healthy and fruitful trees are to be found. That success or failure is largely a question of culture may be gathered from the fact that splendid crops are produced in such diverse localities as Chiswick, where a lesson in Peach growing is taught by Mr. Barron; Bishops Waltham, in Hampshire, where Mr. Molyneux grows Peaches as well out of doors as he does Grapes under glass; and Abberley Hall, in Worcestershire, where Mr. A. Young proves his ability as an all-round gardener by bringing magnificent crops to perfection 500 feet above the level of the sea. These are jotted down as instances which occur to mind at the moment, and others could be given on reflection. If there, why not elsewhere? Much certainly depends on a good start, but there are certain general principles of management which must have full attention, and some of them at least may be gathered from a survey of the splendid quarters of trees at Southfields, and a passing discussion upon them with Mr. Morle. Nowhere, probably, could a more remarkable example of good culture be found than they present. There are several acres altogether, the trained specimens being faultless examples of health, vigour, and symmetry. Though the types are entirely diverse, all kinds of trees having been prepared for different purposes, the general character is the same, all being well furnished with firm ripe wood studded with fruit buds, and with ample healthy foliage, which, however, is now ripened and falling.

The magnificent condition of the trees is certain to awaken interest and call forth a closer observation of the course of culture that is pursued. In one piece there are 1000 beautiful specimens admirably fitted for planting either in or out of doors with a view to immediate fruitfulness. Some are small, but with an excellent foundation on which to base future management. Others are 6 feet or more across and full of fruiting wood, suitable, therefore, for at once covering considerable space and giving fine crops. Side by side with them is a quarter of Seakale, the variety being Lily White, and be it remarked in passing that a very fine crop of forcing roots of this excellent variety was being lifted for the autumn and winter sales. From the land they have been occupying Peaches and Nectarines were lifted, and after trenching the ground 2 feet deep the Seakale was planted. Now the ground will again be occupied by Peaches, and in this process of change we get the key to the splendid condition of the trees. Frequent transplantation is one of the great secrets of their fine condition. It is evident in the clustering masses of fibrous roots attached to trees now being lifted for planting under glass, in the firm clean growth, and in the bold buds which stud the young shoots trained in for fruiting. The one is a natural consequence of the other. Long deep-striking prongy roots which draw up copious supplies of crude sap from the subsoil would have their counterpart in long coarse sappy branches, but they are kept severely in check, and the mass of feeding fibres that are produced as a result of shortening the prongs and frequent transplantation foster a stout, short-jointed, and firm basis of growth above the soil such as speedily develops a fruitful character if kept free from insects and exposed to the ripening influences of sun and air.

The rule of transplantation in which Messrs. Veitch & Sons so firmly believe, and of which they are able to show such wonderful results, is universal, and knows no failure. When a quarter becomes thinned by the removal of a number of trees to supply orders the remainder are re-arranged on a fresh piece, for the lifting benefits them, and by the closing up of gaps valuable land is economised. The holes made where

individual trees have been lifted give an idea of the character of the roots. They are not narrow, deep excavations, but broad shallow basins, many 5 feet across and about 2 deep. The trees lift with an almost circular mass of fibres springing from the bole, and these are spread out to the fullest extent when planted again. By shortening in the earlier stages of the tree the coarse roots are practically done away with, and thousands of small feeders substituted for them. The branches are trained-in with great care. No crossing is allowed, and the man who lays in one shoot above another promptly hears about it, for all the work is carefully supervised. Thus it is that the wood is always stout and well ripened. Sun and air have free play upon it, and fruitfulness follows as a mere course of nature. Thousands of trees of the ordinary fan-shape are represented, and besides them there are others of all characters and heights. There are half-standards with 3-foot stems, and standards with 6-foot stems. Many have a spread of 7 feet of branches, with a height of 3 to 4 feet, and triple buds stud the shoots laid in all over the trees. They are the perfection of good management, and if the treatment extended to them could be imitated with others there would be hope of the lost art of Peach growing being found again.

TRANSPLANTED APPLES AND PEARS.

The practice at Southfields teaches a wholesome lesson on the management of Apples and Pears as well as of Peaches and Nectarines. Transplanting is as firmly believed in in their case, and the results are equally marked. In the place of long, soft, sappy shoots, which, if shortened as they would be by many, would produce more of a like character, there are sturdy, well ripened, thoroughly matured growths with plump fruit buds bristling on the greater part of their length. They are young shoots, it should be noted, with single buds, not stubby old growths with spurs. To prune such trees carelessly would mean a gross waste of fruit, for most likely the young shoots would be shortened to the one or two wood buds at the base, and the fruit buds above them cut away. Frequent transplantation and thin disposal of the branches are the secret of their fruitful character. Whether the stock be the Quince or Pear, Paradise or Crab, whether the trees be bushes for the open ground or trained for walls and espaliers, the general character is precisely the same. Light and air play amongst the branches unobstructed, and their influences may be traced in the present character of the trees and in the splendid array of dishes with which the firm secured a gold medal at the last Earl's Court Exhibition. These young bushes produce magnificent fruit without rich feeding.

Cordon Pears are very largely represented, for they are in great demand. Three-year-old trees that have fruited are full of buds for another season. Transplanted Apples on the Paradise, $4\frac{1}{2}$ to 5 feet high, are a mass of fruit buds from bottom to top. Young gridiron and palmette Pears are the same. There is a growing demand for the latter class. Standards are represented with both open and trained heads to suit all positions. Fan and espalier trees of the best varieties are represented in all sizes. A couple were lifted while I looked on to illustrate the character of the roots, and both on the Pear and Quince stocks they were a mass of fibres.

PLUMS AND CHERRIES.

Trained Plums transplanted in spring are full of flower buds. They are splendid trees in every respect. The lower branches have not been pruned hard back so as to form spurs near the base, but reasonable extension has been permitted and the young growths thinly trained so as to encourage the development of a fruiting character. The same remarks apply to trained Cherries, which, on a framework of stakes, are as flat as if established on a wall. Fruit buds cluster at the base of the young shoots, and are scattered along them. The trees have never been cut hard back, but have been allowed to extend and then been tied in so as to furnish the tree with fruiting wood. Root management has accelerated the result. Single cordon Cherries, chiefly of the Duke race, which are best suited for this mode of training, are lined with fruit buds. The Morellos are also admirable examples of skilful management. The trees have been twice transplanted, range from 5 to 9 feet wide, and are full of fruiting wood carefully trained in. Pyramid and standard Plums for open quarters bear the same impress. There is also a fine piece of Apricots transplanted in spring, healthy, and promising well for fruit next season.

The story could be continued, but enough has been said to make the lines of management clear. All the trees are alike, and fastidious indeed would the planter be who was not satisfied with the splendid material now awaiting selection by purchasers. The trees are a special credit to a firm that does all things well, and afford a lesson the universal learning of which would be of distinct benefit to the nation.—W. P. W.

ROYAL HORTICULTURAL SOCIETY.

NOVEMBER 3RD.

SCIENTIFIC COMMITTEE.—Present: Dr. M. T. Masters (in the chair), Mr. Morris, Mr. McLachlan, Dr. Russell, Dr. Müller, Rev. W. Wilks, Prof. F. Oliver, Dr. Scott, Prof. Church, Dr. Bonavia, Rev. G. Henslow, Hon. Sec.

Injuries to Plants by Fog.—Dr. Russell observed that with reference to carrying out any experiments, the subject must be regarded from two

points of view. Firstly, the object would be to make an exhaustive investigation into the action of fogs upon plants. This, to a considerable extent, the Scientific Committee has already done, as shown in Prof. Oliver's published report, and in a second upon which he is now engaged. Secondly, taking a wider aspect of the subject, the points which would have to be considered would be the composition of fogs in general, their origin and extent, their comparative densities, the amount of sulphurous acid, the consequent diminution of light, &c. Such investigations would lead to the more universally important consideration as to the increasing unhealthiness of London in winter. To carry out this extensive programme would necessitate the selecting several stations, involving continuous observations, both during fogs and in clear weather. The whole would require a staff of paid analysts. Dr. Russell then gave some interesting statistics of observations carried out at Manchester by Dr. Bailey, which will in due time be published. One point to which he alluded may be here mentioned—namely, the amount of chlorides contained in "fog collections" washed out of the air. He himself had found a dense precipitate of chlorides even on Dartmoor, whenever sea breezes blew in that direction. *A propos* of this Prof. Church remarked that he had on one occasion detected 7 grs. of salt per gallon at Cirencester, which was about thirty-five miles from the sea. It is evident, then, that the presence of chlorides do not necessarily always indicate the presence of sewage. Prof. F. Oliver observed that, regarding the injuries from a horticultural point of view, the question as to the best means of preventing the action of fogs was most important. He described three methods. The first, with which he was very favourably impressed as to its efficiency, although it would probably prove to be the most difficult and expensive, was as follows:—The primary condition for success is that the plant house must be air-tight. As glass houses, however, are usually and purposely constructed with air spaces beneath the overlapping glasses, these would have to be stopped up. In a house properly constructed, like that erected by Mr. Toope, the external air entered below, and was passed through boxes containing charcoal. A draught is created by the heated air of the house, which escapes at the top by means of exhaust caps, which allow of the passage of air *from* but not *into* the house. No sulphurous acid whatever then succeeded in passing through the carbon into the house, the filtration appearing to be perfect. A second method suggested was by means of sprays of various kinds, and by sprinkling the floors, &c. This method has its disadvantages, and Prof. Oliver did not express a favourable opinion of it. The third plan is simply to spread canvas over the house during the period of the fog to prevent its passing into the cracks and into the house. Of course the stoppage of light might be, in some circumstances, a serious objection, but not greater than that occasioned by the fog itself. The really injurious element of fogs is undoubtedly the sulphurous acid gas, and this has to be especially combated. A discussion followed as to what steps should be taken by the Society in the matter. It was generally felt that, as far as the Scientific Committee were concerned, they could not do more than undertake the first object mentioned by Dr. Russell; and this has, in fact, been done. The second and wider object, however, is more or less directly concerned with the former, though it may have a much wider scope. It was proposed, therefore, to make a statement as to what the Royal Horticultural Society has already done in the matter, and to invite the co-operation and assistance of other societies, such as the Meteorological; finally, to appeal to the County Council to take steps towards carrying out a more extensive investigation than the Society alone could possibly accomplish.

Termes lucifugus.—Mr. McLachlan corrected an error in the description of the white ant of La Rochelle, as to the size of the larvæ, in that they are really smaller than stated, being less than a quarter of an inch in length.

Artichoke Gall.—He also exhibited specimen of this disease on the Oak, alluded to at a previous meeting. It is produced by *Aphilotrix fecundatrix*, of which the agamic generation is known as *Andricus noduli*.

Calanthea Allonga Tubers.—Mr. Morris stated that the tubers exhibited by him at a meeting in June, 1891, and supposed to be of a species of *Kämpferia*, now proved to be derived from the above-named plant, an old Carib food plant. The description and chemical constitution ascertained by Prof. Church will be found in Jour. Roy. Hort. Soc., 1891, pp. lix. and cviii.

Conifers.—Dr. Masters exhibited a branch of *Pinus pinaster* with erect cones instead of their being reversed. He mentioned that he had once noticed a similar occurrence in the Scotch Fir at Zermatt, Switzerland. The former had been described as a new species with the name *Lemoniana*; but it merely represented a retention of the youngest condition of the cone. *P. ponderosa*—He showed cones of this tree, which are peculiar in having the scales deciduous from below upwards, as occurs in *Abies*. *Pinus excelsa*.—He also exhibited a branching cone of this tree.

Pyrus japonica, fruit.—Mr. Read sent Apple-like fruits of this plant remarkable for their large size, being 7 inches in circumference and $2\frac{1}{2}$ in height, and very symmetrical in form. They were grown against a sunny wall in Ealing.

The "Glassiness" Apple.—A specimen of this translucent Apple was sent from Naples by M. D. Piperno, where it is considered one of the best eating Apples in Italy. Prof. Ward examined and described it on a previous occasion. (Jour. Roy. Hort. Soc., vol. xii., 1890, p. clxvi.)

EVENTS OF THE WEEK.—The ensuing week will be a busy one in horticultural circles. On Tuesday, November 15th, the Committees of the Royal Horticultural Society will meet at the Drill Hall, Westminster, and on the evening of the same day the annual dinner of the Gardeners' Royal Benevolent Fund will take place at the Hotel Métropole, Lord Brassey occupying the chair. Many Chrysanthemum Shows will also be held, and a list of the most important of these is given on another page. Several auction sales are announced, for particulars of which see advertisements.

THE WEATHER IN LONDON.—The weather has been somewhat unpleasant in the metropolis during the past week. Sunday opened wet, but it cleared during the day, and a slight frost occurred at night. Monday was foggy, cold, and damp, similar weather continuing the greater portion of the following day. At the time of going to press it is milder, but dull.

WEATHER IN THE NORTH.—November 1st to 8th.—Rapid alternations of frost, fog, and rain; no day fine throughout, but one or two better evenings have marked the week. The frost has not been severe nor frequent; 6° were recorded on the morning of the 7th. Potato-lifting has been pushed on. The crop has suffered in not a few cases from frost more than from the disease.—B. D., *S. Perthshire*.

HEREFORDSHIRE FRUIT SHOW.—As will be seen by the advertisement, substantial prizes for Apples and Pears are provided at this Show, which opens on the 24th inst., and good competition may be expected.

GARDENERS' EXAMINATIONS.—A paper entitled "A Short Talk on Gardening Subjects" was read by Mr. J. Barry of Chiswick at a recent meeting of the Ealing District Gardeners' Mutual Improvement Society. In the course of other remarks Mr. Barry advocated, as a means to prevent the appointment of unqualified men to leading positions, gardeners' examinations conducted by some properly recognised and unbiassed authority, which should further act as a kind of agency on which employers might rely for securing competent men.

PLUM WYEDALE.—Although cooking Plums are now very numerous I do not think the merits of the above variety are generally known. We have a tree of Wyedale trained on a north wall, and which is loaded with fruit of a good size at the present time. I have gathered it as late as the end of November. When ripe the fruit is black, and the flavour is good for a late Plum. It is a free-setting variety and a good grower, making a valuable addition where late Plums are required. Anyone not knowing this variety cannot make a mistake in adding it to their collection. It does well on a north wall.—JOHN CHINNERY.

AGAPANTHUS UMBELLATUS ALBUS.—Having seen the remarks made in the *Journal* (page 353) regarding the usefulness of the blue Agapanthus, may I ask if any reader can enlighten me a little on the above variety? I have two large plants which I have grown for the last seven years, but have not yet succeeded in flowering them. I have tried various ways. They have received the same treatment as the old variety, which flowers profusely. I have exposed the plants to all the sunshine possible, and tried them in an intermediate temperature, but to no purpose. I have been told by some neighbouring gardeners that they have also tried this variety until they were tired of doing so.—RECTORY.

THE WAKEFIELD PAXTON SOCIETY.—There was a good attendance of the members at a recent meeting of the above Society to hear the opening lecture of a series entitled, "Studies in Elementary Botany." Mr. G. W. Fallas, one of the Hon. Secs., who was nominated for part 1, commenced a very interesting address by defining a plant as an aggregation of cells combined together in various ways and differentiated into parts forming the numerous organs and members of a plant. He then described the structure and functions of a single cell as the unit of plant life—*i.e.*, the cell and its contents, its work in growth, assimilation, reproduction, and the external conditions essential for their proper performance of the vital processes.

GARDENING APPOINTMENT.—We understand that Mr. Thos Fleming, late gardener at Cradockstown, Naas, has been appointed gardener to Mrs. Jury, Greenfield, Donnybrook, Co. Dublin.

HER MAJESTY THE QUEEN has been graciously pleased to accept from the author, Mr. Wm. Paul of Waltham Cross, a copy of his newly published volume, "Contributions to Horticultural Literature."

AMERICAN GARDEN IMPLEMENTS.—Will someone who has used the "Planet Jr." American Garden Implements say whether they are to be recommended as really economical and labour-saving?—W. R. RAILLEM.

THE PUBLIC PARK AT WAKEFIELD.—The work of laying out the public park, which has been entrusted to Messrs. Backhouse and Sons of York, has been commenced in earnest, and will proceed without interruption unless very unfavourable weather is encountered. The park is to be opened next spring.

EUPHARIS CANDIDA.—I enclose a photograph of *Eupharis candida* grown in the greenhouse, as my gardener informs me that it is somewhat unusual for a single plant to have seven spikes and twenty-four blooms.—RICHARD C. LONG. [The photograph represents a plant that is a credit to your gardener.]

DEATH OF MR. GEORGE MANNING.—With regret we record the death of Mr. George Manning, who died on Tuesday, November 1st. Mr. Manning, who was engaged, in connection with his father, Mr. T. Manning, at Messrs. J. Veitch & Sons, Royal Exotic Nursery, Chelsea, leaves a widow and one child. His remains were interred on Saturday.

EUPHARIS IN POTS.—Since last Christmas I have had from two plants in 14-inch pots forty-six dozen blooms. I have only just finished cutting the last batch, which comprised ten dozen flowers. There are many more spikes just coming up, and they average seven blooms on each spike, so I hope to have plenty by Christmas.—R.

THE WEATHER IN DUMFRIES.—We have had a week of very unsettled weather. November 1st was fine, but frost was severe at night the thermometer registering 19° on the grass at Dumfries. Rain fell nearly all day on the 2nd and 3rd. The 4th and 5th were dry, but heavy rain fell towards night. The 6th was fine but dull, and to-day (7th) is very foggy.—S. ARNOTT.

A LARGE ONION.—The *Exmouth Chronicle* says:—"A fine specimen of the Lemon Giant Rocca Onion is now on view at Mr. W. J. Godfrey's, Rolle Street. It was grown by Captain Astley Cooper of East Budleigh. It weighs 2½ lbs., is 18½ inches in diameter, and was raised from seed supplied by Mr. Godfrey." Our contemporary probably means 18½ inches in circumference.

WEED KILLERS.—A statement has been made in a contemporary that those weed killers which are composed of arsenic are highly dangerous, the poisonous matter flying about in dry weather. As these preparations have proved extremely useful in saving labour at busy times, it seems very desirable that the question of danger should be absolutely set at rest one way or the other.—W. R. RAILLEM.

WOOLTON GARDENERS' MUTUAL IMPROVEMENT SOCIETY.—The third meeting of the session was held in the Mechanics' Institute on Thursday last, the Rev. R. T. Roberts in the chair. There was a large attendance, the lecturer being E. G. Baillie, Esq., Chester, who discoursed at some length on "Vegetarianism." The lecturer divided his subject into three parts—*viz.*, National, Social, and Moral, all of which were entered into very fully. A hearty vote of thanks was passed to Mr. Baillie for his most interesting lecture, a similar vote to the Chairman terminating the proceedings.—R. P. R.

STOPPING CUCUMBERS AND MELONS.—I can assure Mr Young (page 396) that I had no intention of being "hard on Mr. Swan" simply because he stopped Cucumbers so closely. I did not even condemn that practice. What I pointed out was, that there must have been something radically wrong with his practice before he took to stopping closely, if by so doing he was enabled to "double" the crop produced. When Cucumber culture is well carried out, let the system be what it will, no amount of alteration in stopping tactics will enable the cultivator to make such rapid strides in that direction. Mr. Young's reference to Melons needs but little comment from me, as it quite condemns the practice adopted by Mr. Swan, and cannot by any means be considered close stopping; and, moreover, so practical a grower would be certain to produce something good under any system of stopping.—H. DUNKIN.

— ABELIA RUPESTRIS.—This sweet-scented rock Abelia is now flowering in profusion at the foot of a south wall, where its pink bell-shaped blossoms are much admired. It is but seldom we see a really good plant of this shrub, which is to be regretted.—S.

— BERBERIS THUNBERGI.—A large plant of this beautiful Barberry is now a splendid object in the Old Nurseries, Cheshunt. The warm glow of a rich sunset appears to flood the small leaves, and it stands out from the mass of withering foliage around it like a live ember among dead cinders. In the spring the foliage is of a tender green, and the white flowers are very attractive; then comes the autumn glow, and after the foliage has gone the bright coral berries deck the plant. It has, therefore, three well-marked phases of beauty, and presents powerful claims to attention.—P.

— HORTICULTURAL EXHIBITION AT GHENT.—Lovers of botany are looking forward with much interest to the International Horticultural Exhibition to be held at Ghent next spring. These exhibitions are held every five years, but the coming Show is expected to surpass in magnificence all that have yet been seen. Endless varieties of Orchids, Palms, Camellias, Azaleas, Rhododendrons, Aroids, Conifers, Ferns, and other plants from all parts of Europe are to be exhibited. America is to contribute, and promise is made of some beautiful plants from the Congo. Prizes of medals and rich works of art are offered by the King and Queen of Belgium and by various societies and notabilities, amounting in total value to between 35,000 and 40,000 francs.

— THE RAINFALL IN OCTOBER.—October has in many respects been like the corresponding month of last year. There were the same number of wet days, but the total rainfall has been in this district somewhat lighter during the past month than October of 1891. Notwithstanding the great amount of wet we have had, Dahlias and flowers of a similar nature stood uninjured until the morning of the 24th, when 11° of frost were registered. Rain fell on twenty-one days during the past month. Maximum in any twenty-four hours was 1.05 on the morning of the 31st. Minimum 0.1 on the 25th. Total fall during the whole month 3.90 against 5.04 of 1891.—E. WALLIS, *The Gardens, Hamels Park, Buntingford, Herts.*

— A WINTER TENNIS COURT.—One on a large scale has recently been formed at Downside. Mr. Tate and his family are very fond of the game of tennis, but cannot play on grass in the winter, and do not care to take refuge in a covered place. As the substratum, and a very near one, is chalk, drainage was not required. The excavation made necessitated the removal of great quantities of this material to secure the needful level, the sides on the higher ground being sloped, soiled, and turfed. Then on the surface of chalk there was laid several inches of coal ashes, which was well rammed and rolled, and on the surface a coating of pounded or crushed red brick. This, again, is kept well rolled. The floor is devoid of that hardness which characterises asphalt, is porous, and soon dries, and being a trifle soft is elastic to the feet. The court thus made appears to be a striking success.—A. D.

— TECHNICAL EDUCATION IN HORTICULTURE.—The Council of the Scottish Horticultural Association having been allocated a portion of the residue grant by the Town Council of the City of Edinburgh, has arranged a course of lectures to be delivered during the ensuing winter and spring. The scientific and practical aspects of the subjects chosen will be treated by eminent authorities, and the lectures will be free to all interested in the advancement of horticulture. This being the first time that such a course of lectures has been given in Scotland, and looking to the importance of the subject from a commercial point of view, it is to be trusted it will be well taken advantage of by the general public. Bursaries will be given to successful competitors, who must have attended three-fourths of the lectures, and must be under gardeners or nurserymen, and approved of by the Council. Intending competitors should intimate such, in writing, to the Hon. Secretary, Mr. Robert Laird, 17, South Frederick Street, Edinburgh, at the beginning of the session, and not later than the 1st December. The following lectures are arranged—"The Chemistry of Plants and Soils," by Mr. W. Ivison Macadam, F.R.S.E., &c.; "The Structure and Physiology of Cultivated Plants," by Mr. A. N. Macalpine; "The Hybridisation, Selection, and Improvement of Plants," by Mr. John H. Wilson, D.Sc., F.R.S.E.; "Hardy Fruits," introductory lecture, by Mr. A. F. Barron, Chiswick; "Apples," by Mr. Dunn, Dalkeith; "Apricots and Cherries," by Mr. Temple, Carron House, Falkirk; "Peaches and Nectarines," by Mr. Fairgrieve, Dunkeld; "Plums," by Mr. Dunn, Dalkeith; "Strawberries," by Mr. Temple, Carron House, Falkirk; and "Pears," by Mr. M'Kinnon, Scone Palace, Perth.

— VINE CULTURE IN ROME.—A large section of the gardens of the Vatican is, says a daily contemporary, set apart for the culture of Vines, and the Pope takes a great pleasure in superintending their cultivation. The soil is somewhat poor and barren, but nevertheless the crop results in a fairly good quantity of Grapes, which make an indifferent wine.

— ROYAL METEOROLOGICAL SOCIETY.—At the ordinary meeting of the Society, to be held by kind permission of the Council of the Institution of Civil Engineers, at 25, Great George Street, Westminster, on Wednesday, the 16th instant, at 7 P.M., the following papers will be read:—"Thunderstorm, Cloudburst, and Flood at Langtoft, East Yorkshire, July 3rd, 1892," by John Lovel, F.R.Met.Soc.; "On the Measurement of the Maximum Wind Pressure, and Description of a New Instrument for Indicating and Recording the Maximum," by W. H. Dines, B.A., F.R.Met.Soc. The meeting will be closed at 8.45 P.M., when a special general meeting will be held to consider certain alterations in the bye-laws. A copy of the alterations proposed by the Council is open for inspection at the Society's office at the above-mentioned address.—WILLIAM MARRIOTT, *Assistant Sec.*

— RUDBECKIA NEWMANI.—I never remember seeing this perennial so full of flower nor last so long as it has this year. The dripping weather experienced during August just suited this Rudbeckia, which is perhaps affected by drought more quickly than any other hardy plant in cultivation. A few dry days with hot sun and its leaves commence to flag. What a splendid contrast the flowers are with those of *Aster amellus Bessarabicus*! Although we have a quantity of both I mean to further increase them this autumn. For making a border gay during the month of September it is difficult to find anything to equal, let alone excel them.—YORKSHIREMAN.

— CEDARS OF LEBANON.—An American botanist has claimed for the Cedar in the Jardin des Plantes in Paris, which was brought from Palestine by the elder De Candolle more than a century ago, the credit of being the oldest Cedar of Lebanon in Europe. There is evidence, however, as Mr. Veitch points out, that a specimen of this noble tree was introduced among us soon after the date of John Evelyn's "Silva, or Discourse on Trees, 1664," and there is, it appears, now growing at Bretby, in Derbyshire, a specimen known to have been planted in 1676. De Candolle's tree has an interesting history, says a daily contemporary. The vessel in which he crossed the Mediterranean was unseaworthy, and during the prolonged voyage the sailors and passengers suffered greatly from the scarcity of water, but De Candolle resolutely denied himself, and gave his scanty portion to the little tree, which, thus saved from perishing, has become the living monument of the great botanist. [Our contemporary is in error about De Candolle.]

— A LATE COTTAGERS' SHOW.—Very unusual is it to see, so late in the year as November 4th, such a remarkable display of cottage garden produce as was furnished in the Corn Exchange, Farnham, Surrey, on that date. The local committee strive to join their cottagers' show with that of Chrysanthemums, and whilst the latter suffer because shunted into an upper room where they do not attract much attention, or make a brilliant display, the cottagers' department suffers because the products never are so good in quality as is the case when shown early in the autumn. The whole of the large Exchange Hall was literally crammed with Potatoes, all too big and coarse; Carrots, Turnips, Onions, Beet, Parsnips, Celery, Cabbages, and various other winter vegetables, some very fair, but many showing need for more tasteful selection, also the effects of a cold wet autumn. There was very considerable competition in the classes, especially in those for six dishes, prizes given by Messrs. Sutton and Sons and the local committee. There was also a good competition in the gardeners' class for twelve varieties of vegetables, for prizes offered by Messrs. Mortimer, Clarke, Harris, and Bide, all local seedsmen. A pretty group of plants sent by Mr. Dowden, gardener to the Bishop of Winchester, Farnham Castle, decorated the hall platform. Messrs. Mortimer, Cresswell, Harris, and others showed fair groups of Chrysanthemums, but cut flowers were few; the season, so far, had proved to be far too late for the local growers. Grapes were very good, and some capital Apples and Pears were staged. A very fine collection from Mr. Bide attracted much attention, as also did a beautiful lot of Lady Selborne white Chrysanthemums in boxes from Mr. Mortimer. Late in the afternoon, Mr. A. Dean, representing the Surrey County Council, gave an address to a large number of the exhibitors, dealing chiefly with the exhibits, the good and indifferent qualities of which were pointed out.

— THE WEATHER LAST MONTH.—October was a wet month with very little sunshine. We only had nine bright days during the month. The first snow of the season fell on night of the 21st. Wind was in a westerly direction for twenty-one days. We had gales on the 9th and 29th. Total rainfall was 4.03 inches, which fell on twenty-two days, the greatest daily fall being 0.76 inch on 13th; this is 1.09 inches above the average for the month. Barometer highest reading 30.30 at 9 A.M. on 19th, lowest 29.28 at 9 P.M. on 28th. Highest shade temperature, 60° on 29th; lowest, 24° on 26th; lowest on grass, 17° on 26th. Mean daily maximum, 50.61°; mean daily minimum, 37.67°; mean temperature of the month, 44.14°. The garden spring ran 18 gallons per minute on the 31st.—W. H. DIVERS, *Ketton Hall Gardens, Stamford*.

— THE WEATHER DURING OCTOBER AT RIPLEY, YORKS.—This was a very dull month, and will long be remembered in this locality owing to the heavy rainfall and great floods. At 8 P.M. on the 13th rain commenced falling heavily, and continued without cessation until 5 P.M. on the 15th. During that time (forty-five hours) we registered 3.75 inches. The river Nidd rose to an abnormal height, flooding a great extent of country, and causing a sad loss to those farmers who had land abutting on the river side. The total rainfall for the month was 6.54 inches, which fell upon twenty-two days, the greatest daily fall being 2.44 inches on the 14th. Frost was recorded on fourteen days, the most severe being 15° on the 26th. Mean reading of barometer, 29.72; mean maximum temperature, 51.2°; mean minimum temperature, 31.4°; mean temperature of month, 41.3°. On the 18th, 11° of frost put an end to the present season's display of Dahlias and other half-hardy flowers.—J. TUNNINGTON, *Ripley Castle Gardens, Yorks*.

— WINTER-BLOOMING CARNATIONS.—There seems to be no flower so universally required by those who can afford to grow or purchase them as Carnations. That applies especially to the winter-blooming section. Thus at Downside, Leatherhead, where there seems to be almost a wealth of plants of every description to furnish beautiful flowers in the winter, a large portion of a span-roof house is filled with plants in various sized pots of that fine deep scarlet Winter Cheer; Alegatière, Madame Carle, white; Improved Miss Jolliffe, a good salmon; Colonel Cox, deep red; Pride of Penshurst, yellow, and others. Winter Cheer is a peculiarly good grower, and produces very fine robust plants from spring-struck cuttings. These are either planted out, then lifted and potted in September, or are grown in pots in cool frames. These flowers seem to be indispensable for buttonhole purposes, and really give in blooms a large return for the labour and expense given to their cultivation.—A. D.

— SUMMARY OF METEOROLOGICAL OBSERVATIONS AT HODSOCK PRIORY, Worksop, Notts, for October, 1892.—Mean temperature of month, 44.9°. Maximum on the 28th, 59.6°; minimum on the 26th, 23.2°. Maximum in the sun on the 1st, 108.1°; minimum on the grass on the 26th, 17.7°. Mean temperature of air at 9 A.M., 44.1°; mean temperature of soil 1 foot deep, 47.3°. Nights below 32° in shade four, on grass fifteen. Total duration of sunshine in the month 102 hours, or 33 per cent. of possible duration. We had eight sunless days. Rainfall, total in the month, 4.39 inches. Rain fell on twenty-three days. Average velocity of wind, 9.1 miles per hour; velocity exceeded 400 miles on one day, but fell short of 100 miles on four days. Approximate averages for October.—Mean temperature, 48.1°; sunshine, eighty-three hours; rainfall, 2.73 inches. A cold and wet month, but a fair amount of sunshine. The mean temperature is as low as any October during the last sixteen years.—J. MALLENDER.

— DEVON AND EXETER GARDENERS' ASSOCIATION.—The members of the Devon and Exeter Gardeners' Association held a meeting at the Guildhall on November 2nd, when an excellent paper on "How a Scientific Knowledge of Plant Life can Help a Gardener," was read by Mr. J. Stoneman, teacher of botany at the Exeter Science School. The lecture was illustrated by several plants lent by Mr. Bartlett (gardener to Lady Duckworth, Knightleys), and Messrs. Veitch & Sons of the Royal Nurseries. A beautiful collection of Gloxinia blooms was also shown. Before the commencement of the lecture the Hon. Secretary (Mr. A. Hope) announced that he had received a communication from Mr. F. Pullinger, Secretary to the Devon County Council Technical Instruction Committee. It would be remembered that on September 16th he wrote to the Committee for a grant towards technical instruction in gardening. The reply was to the effect that the Committee regretted they were unable to recommend a grant to the Association for the purpose required. Still, he might state that with regard to this matter something would ultimately be done by the County Council.

CHRYSANTHEMUM SHOWS.

THE following Chrysanthemum Shows, which have been advertised in our columns, will be held during the ensuing week. For the convenience of readers we append the names and addresses of the respective Secretaries:—

- Nov. 10.—Calne. Fred C. Henley, Calne.
- „ 11 and 12.—Bradford and District. G. R. Taylor, 102, Goodwin Street, Bradford.
- „ 11 and 12.—Derby. H. J. Bell, Normanton Road, Derby.
- „ 11 and 12.—Leicester and Midland. W. Bell, Knighton Road, Leicester.
- „ 11 and 12.—Sheffield, Hallamshire, and West Riding. W. Housley, 172, Cemetery Road, Sheffield.
- „ 11 and 12.—Eccles, Patricroft, Pendleton and District. H. Huber, Hazledene, Winton, Patricroft.
- „ 15 and 16.—Liverpool. W. Dickson, 35, Victoria Street, Liverpool.
- „ 15 and 16.—West of England. Messrs. Wilson and Damerell, 4, North Hill, Plymouth.
- „ 15 and 16.—Wimbledon. Dr. Walker, 12, Lingfield Road, Wimbledon.
- „ 15 and 16.—Reading. W. L. Walker, Dunollie, Bulmershe Road, Reading.
- „ 16 and 17.—Hull and East Riding. E. Harland, Manor Street, Hull.
- „ 16 and 17.—Rugby. W. Bryant, 19, Oliver Street, Rugby.
- „ 16, 17 and 18.—York. J. Lazenby, 13, Feasgate, York.
- „ 17, 18 and 19.—Edinburgh. R. Laird, 11, South Frederick Street, Edinburgh.

THE NATIONAL CHRYSANTHEMUM SOCIETY AND ITS CERTIFICATES.

IN the last issue of the *Journal* there is a letter on the above subject from Mr. R. Dean, and also a copy of the resolution adopted by the sub-Committee which was appointed to inquire into circumstances detailed in your issue of October 27th.

I trust you will give me space to offer some little explanation which Mr. Dean's letter demands.

1, Apparently Mr. Dean wishes to make something out of the fact that the 12th of October was not the first time Beauty of Exmouth had been before the Committee. I have not suggested that it was. In Beauty of Exmouth I knew well I had a variety which would make its mark, and I wrote you asking particulars as to illustrating it, if you deemed it worthy of such honour. Your reply was, "First get it certificated by the N.C.S. and R.H.S.," and you certainly were quite within your right in thus advising me. You were not supposed to know that it had already been before the Floral Committee. But all this is immaterial to the point in question.

2, Mr. Dean says the action of a member of the Floral Committee in speaking disparagingly of my blooms is regrettable, but it is nothing more than what he has observed at the meetings of the R.H.S. Surely "two wrongs do not make a right" is applicable in this case. I quite concur in what Mr. Dean says as to his opinion being asked by exhibitors prior to blooms being placed before the Committee. If he had advised me to put my blooms "under the table" I should have done so without a murmur, and feel confident he was advising me for the best. But the member in question afterwards exhibited several varieties, which in my opinion were greatly inferior to mine, of which he spoke disparagingly, and as the action of the Floral Committee testified by a request to see my Duchess of Devonshire again, whilst, I believe, only one out of his several had this honour conferred on it.

3, Here again I quite agree with Mr. Dean, and do admire anyone who has the courage of his convictions, and, in spite of all consequences, will do his duty; but the member complained of could not think Beauty of Exmouth was similar to any other variety, or he would not have offered to have purchased the stock at a big price.

4, The only objection raised to the awarding of a first-class certificate to Beauty of Exmouth was, "It is Florence Davis, or very like it." Nothing was said about its being a foreign variety. Mr. Dean replied to this objection in rather an indignant tone, "But Mr. Godfrey says he raised it himself from seed of his own saving." Mr. Boyce then suggested that I, being present, should be called forward, and he repeated this suggestion several times. Ultimately I was asked by Mr. Dean to give an explanation. I did so, adding, "If it was Florence Davis, as alleged, how is it that no blooms of that variety were exhibited?" Mr. Cannell said there was one, and upon comparison my seedling was found to be decidedly superior. Still, the award of a first-class certificate was objected to by the member, who afterwards wished to purchase the stock "at a big price."

Mr. Dean considers I should have lodged the complaint with him, he being the Secretary. Well, perhaps I ought to have done so, for the charge is a serious one, and its truth is yet undenied. On the other hand I did not consider I was compelled to keep silence, and if the

representative of the *Journal*, and others, heard my remarks after the meeting he certainly had a right to attempt to correct what seemed to him an extraordinary statement of facts. Mr. Dean says I was in conversation with him several times after the rising of the Committee. To the best of my remembrance I only spoke to him twice, and in neither instance did we stand still, he being fully occupied with his official duties. But to me all these minor matters are side issues, the main point is this: I have brought a serious charge against an official of the National Chrysanthemum Society. Can this charge be substantiated? If so, was I justified in my complaint? also, if the charge of irregularity is well founded, what do the N.C.S. intend to do in the matter, so that its certificates may have their proper value, and the Floral Committee have the perfect confidence of the gardening public?

Now, as to the resolution of the committee of inquiry. The publication of the letter to you is unnecessary, as this committee have a copy of the said letter, wherein the name of the offending member is plainly stated. If they are in earnest, and really mean to deal with the matter without bias, I have no objection to the publication of the name and address of the member complained of.—W. J. GODFREY, *Exmouth*.

NATIONAL CHRYSANTHEMUM SOCIETY'S CATALOGUE.

MR. C. HARMAN PAYNE, Hon. Secretary of the Catalogue Committee of the National Chrysanthemum Society, sends us a supplement to the centenary edition. This is a decided acquisition, inasmuch as it contains a complete list of all the newest varieties. Being published at the modest price of 6d., it should be in the hands of every Chrysanthemum grower.

CHRYSANTHEMUMS AT "MY GARDEN."

As usual at this time of year Mr. Smee has thrown open "My Garden" for the public to view the Chrysanthemums all this week. The plants are in full flower and are arranged in the large span-roofed house. His kindness is highly appreciated by the residents of the neighbourhood.

Calls on Celebrities.

MESSRS. JAMES VEITCH & SONS.

A BRILLIANT display of Chrysanthemums now forms a great feature in Messrs. Veitch & Sons' nursery at Chelsea. The collection has been vastly improved this season, and the general expression of opinion by visitors is that it is far ahead of any previous shows of a like character. So far as varieties are concerned it is well up to date, and the plants have been admirably grown, so that the best of the novelties are represented by excellent blooms. The plants are arranged in a large and lofty house. There is a central bank extending the length of the house, and lines of plants at each side. These are all full of bloom, and the colours have been carefully harmonised, so that the view from the central path leading through the nursery is a very beautiful one, and creates a strong desire to enter.

Amongst the Japanese that appear to be particularly good this season is Mrs. Falconer Jameson. It has been staged in fine condition at various exhibitions, and is a strong feature of most collections. There are some splendid blooms of it at Chelsea. George Atkinson, a pure white Japanese with broad florets split at the tips, the centre faintly tinged with green, is represented by some good flowers. The hairy yellow Japanese varieties, W. A. Manda and H. Ballantine, are arousing some interest this season. The former is beautiful in colour, approaching apricot; but up to the present is somewhat thin. If weight and fullness can be got into the flower it will be a valuable variety. H. Ballantine is much earlier. At Chelsea some large heavy blooms are noticeable, which have been out since October; it is pale yellow, and by no means an ineffective flower. Bouquet des Dames is one of the best things in the whole collection. It is a somewhat early bloomer, very full, and with broad florets, white, very faintly tinged with pink; it is, however, now well known. Vivian Morel is another of the season's successes; it is good everywhere, and has turned out to be one of the greatest acquisitions ever made. There are some particularly fine blooms in Messrs. Veitch's collection. The run on this variety last season is likely to be repeated. Sokoto, a deep clear yellow Japanese, is also in very good condition, and Robert Cannell is another variety which is remarkably well done. This grand incurved has a great future before it, the blooms coming very heavy with good culture, and the colour being a popular and effective one. W. K. Woodcock is one of last season's novelties, and is likely to make its way. It is of the Bouquet des Dames type, but with shorter blunt florets, and the colour is bronzy yellow, the centre deeper. Colonel Smith is another of last season's varieties that is represented. It would not be at all surprising if the run on it this year should surpass that on Vivian Morel last season, for it is a noble variety with a striking individuality. Florence Davis is excellently shown, and so is W. Tricker, which is good all round this season.

A very prominent place amongst last season's novelties is taken by Mdle. Marie Hoste. It is a Japanese with very broad florets, and like Puritan, of most refined appearance. In the early stages of the flower it is tinted with rosy lilac, which is deepest toward the edges, but it is white when developed. A. H. Neve is an older Japanese worthy of a place; it is a strong grower, a free bloomer, and has very pleasing flowers, white tinted with blush. Miss Anna Hartzhorn is splendid and should not be overlooked by any grower. This grand new Japanese opens of a pinkish tinge, but speedily pales to white, and has very broad

substantial florets. C. E. Shea, the "yellow Lacroix" is finely grown at Chelsea. It is a valuable variety, though not of full exhibition size. Violet Rose is a handsome Japanese, the flower being a substantial one and the colour a rich deep rose, but it is rather late, terminals coming in in December. Mdme. Blanche Pigny is conspicuous for its freedom of flowering, and enough blooms may often be cut from an old plant for making a wreath. Cesare Costa is admirably grown and appears to be giving great satisfaction everywhere, while there are also excellent blooms of John Lambert and Mrs. Robinson King. Eugène Giat (J) is very good. It is a strong grower and is carrying some splendid flowers which display great depth. The colour is rich purplish rose. President Hyde is an improved Mabel Douglas and makes an excellent bush. The soft yellow flowers are very pleasing; Edwin Beckett, too, is excellent.

There will be many Chrysanthemum growers in town this week, and they may be advised to call at Chelsea. A visit will have its reward in the inspection of a collection which is representative and interesting in a high degree.

MESSRS. J. R. PEARSON & SONS.

BEESTON has deservedly won a high reputation for Chrysanthemums. Near the pleasant Nottinghamshire town are the nurseries of Messrs. Pearson & Sons, in which the autumn flower is grown on a scale and with a success not equalled in many other places. Mr. C. E. Pearson formed the nucleus of the collection, and when it developed such proportions as to claim more time than he could devote to it without letting other parts of the business suffer, the services of an expert were requisitioned. Mr. J. Pithers secured the reversion of Elijah's mantle. Few men have so great a knowledge of Chrysanthemums and their culture as he, and under his skilful care the collection has become one of the great sights of the season.

The great show house in the Chilwell nurseries is 100 feet long by 30 feet wide, and very lofty. It is a splendid structure, and when the plants are at their best there is no finer spectacle in the country than it presents. It is not all shell and no kernel, but is full of admirably grown plants. Many are carrying blooms of exhibition quality, others are trained specimens, and in the management of the latter as in the production of the former Mr. Pithers is an adept. Old and new varieties both claim attention. The new large Anemone Delaware is very conspicuous for its strong sturdy habit and fine flowers. Another new variety of the same section is Mdle. Nathalie Brun, which is noteworthy for its very full centre. It is white tipped with lemon. Emily Doone is a very promising Japanese with very deep flowers. The florets are white with lemon centre, incurving. It is an American variety of which more will be heard. John Farwell is a Sunflower-like Japanese with deep crimson flowers, and is well worthy of trial. Mermaid, white, tinted with lemon, is an American Japanese noteworthy for its sturdy habit. In this respect it compares favourably with Exquisite, of which the silvery rose shade is pleasing, but the tall weak growth much the reverse. Robert Flowerday is another transatlantic novelty. The incurving florets show the rosy lilac reverse, but the face is rich crimson. Evelina Stein is most pleasing with its soft blush shade, but the bloom is at present too thin. W. W. Coles is very fine. When in its best condition this is a most effective bloom. Colonel Smith is also splendid. Fine flowers of such Japanese as Bouquet des Dames, Puritan, Mrs. Alpheus Hardy (a much more vigorous form than the old one), Miss Anna Hartzhorn, Gorgeous, Stanstead White, W. H. Lincoln, and W. Tricker, are noticeable.

Amongst the incurved Robert Cannell is conspicuously good, and so are Alfred Salter, John Lambert, Lord Alcester, Mons. Bahuant, Ami Hoste (an improved Mrs. Shipman), and Beverley. There is, however, a home-raised seedling that may be classed as an improved Beverley, having a finer petal, and it will probably take a prominent place among white incurved. A Japanese seedling with crimson maroon flowers having a silvery reverse is also good. It is a strong Edouard Audiguier. A cross between William Holmes and Condor is also promising, uniting a large full flower of a deep rose hue with a vigorous habit of growth.

There are not so many continental novelties as may be seen elsewhere, for the firm buy carefully rather than indiscriminately, but the novelties of really sterling merit have a prominent place. No one who has an opportunity of getting to Beeston should omit to call. There will be much besides Chrysanthemums to see, but of this more later.

MESSRS. PITCHER & MANDA.

A VERY enterprising firm is the Anglo-American one named above. They got together an extensive business in the United States, then opened an English branch, and are publishing catalogues in several languages. From the first they have made themselves famous for Chrysanthemums, devoting their attention chiefly to novelties, and in their nursery at Hextable, near Swanley, they have a select collection under the general management of Mr. A. J. Manda and the special care of Mr. Robt. Hamill. We owe a great deal to America in the way of Japanese, some of our leading varieties having been raised there, and the number of novelties increases instead of diminishing. For everything new and promising Messrs. Pitcher & Manda keep a particularly sharp look out. They are working up a good stock of W. A. Manda, which might be described as a hairy-petalled Ralph Brocklebank, and it is worth noting that good flowers from crown buds are much more hairy than terminals. One of the best novelties they have is without doubt George W. Childs, a splendid Japanese reflexed with large rich brownish-crimson flowers, having a bluish suffusion. Plants in 48's are carrying fine blooms. The

habit of the plant is very strong and sturdy. Miss Annie Manda is a pure white with the hairy petals of Mrs. Alpheus Hardy, and much more vigorous. Of Colonel Smith there are some good blooms. This noble variety is splendidly grown at Hextable.

One of the most distinct Chrysanthemums yet introduced is Lord Brooke, and there is every promise of its turning out a splendid acquisition, for plants in 48's have done remarkably well, and are noteworthy for their fine foliage. The flower will probably be classed among the Japanese incurved. The colour is somewhat difficult to describe; apricot suffused with bronzy red, perhaps, hits it off pretty well. Mrs. Harman Payne is very likely to take a high position amongst the Japanese, for its soft rosy mauve flowers with their silvery reverse are very fine from the terminal bud; crowns are comparatively poor. Edwin Beckett is in very good condition, and makes an effective plant. The Tribune is a new yellow Japanese with very broad substantial florets of a clear pale yellow, and should be tried. Mrs. Ramsay is another well worthy of a trial. It is a Japanese with very broad rich rosy crimson florets. Delaware, the fine new Anemone flowered, is in splendid condition.

These named are a few among the many novelties grown, and which collectively make the display well worth inspecting. Visitors must not expect a great number of old varieties, for Messrs. Pitcher & Manda aspire to lead rather than follow, hence concentrate their attention upon new aspirants for favour. Their nursery is about twenty minutes' walk from Swanley Junction on the L. C. and D. main line, and is one of the places which should be marked for a call. The plants are excellently grown and form with the Cypripediums, of which a special feature is made, a display of more than ordinary interest.

CHRYSANTHEMUMS AROUND SHEFFIELD.

Mr. Henry Greaves, an amateur who grows a number of plants remarkably well in a part of the town not noted for its pure atmosphere, has this year, as in previous years, a fairly representative collection of the best leading Japanese and incurved varieties. The Japanese have a long low house to themselves, where they are developing some very fine blooms. Some of the most noticeable were several grand flowers of Vivian Morel, deep, clean, and large. Louis Boehmer and H. Ballantine, the hairy varieties, were promising well. W. Tricker had blooms of good size, substance, and colour, nearly fully developed at the end of October, and were shaded from strong sunshine. W. H. Lincoln was well forward; Etoile de Lyon had commenced to open; Mrs. J. Wright, with its compact white flower, composed of fluted florets; L'Automne, an incurved Japanese, and a beautiful flower of Elaine, symmetrical in form and of the purest white; also Stanstead Surprise were fully open. Many other good varieties promised well. The incurved flowers, which also had a separate house, were opening fairly well, among them Mons. R. Bahuant being grandly to the fore with good rich blooms. Noel Pragnell, the new sport from Empress of India, had nearly expanded flowers, distinctly displaying the narrow purple line down the centre of most of the petals. Many other leading kinds by their appearance indicated the unfolding of compact and shapely blooms, but upon the whole the majority are late this year.

Mr. Greaves has been a very creditable exhibitor of dwarf plants in bloom, but it is feared he will be considerably behind this year, as his plants though healthy and promising are scarcely sufficiently forward to make as large a display as he formerly has done at the Sheffield Show. Many of course will be right, including Mons. Bernard, L'Automne, and Sunflower. The plants have an excellent light house to themselves, and are of various heights in 4½, 5, and 6-inch pots. A week of favourable weather will hasten many on, now just showing, and though perhaps not able to construct a large group he may be able to form an interesting collection. He considers he ought to have taken cuttings earlier for his dwarf plants, the end of May being rather late in such a season as the present has been hereabouts. Probably another year he will act on his own advice and insert them, as he says he ought to have done, at the beginning of May. He has also utilised the plants from which the cuttings were taken, many of them breaking strongly after the topping, and giving good shoots that are now furnished with fine blooms.—E. D. S.

CHRYSANTHEMUMS AT DOWNSIDE.

THE village of glass houses which a few years since Mr. W. Lee had full of Orchids at Downside, is now under the control of Mr. W. Mease, whose liberal employer is Mr. Tate, son of Mr. H. Tate of Streatham. Mr. Mease is an old Liverpool man, and was amongst the foremost of Chrysanthemum growers in the famous town on the Mersey, when it was the function of Liverpool men to come south even so far as Kingston, and by taking all the best prizes show the southrons what they had to do to enable them to produce first-class flowers. Mr. Mease, like Mr. Molyneux, has come south himself, and for some two and a half years has been in charge of the Downside gardens at Leatherhead. He exhibits with some pride many fine cups and medals he has obtained for Chrysanthemums and other products from time to time, amongst others being the beautiful silver vase of the Wimbledon Chrysanthemum Society, won two years in succession, and to be won once more ere it becomes his property. Whether that consummation will result this year will be known shortly, as the Show takes place on November 15th inst. Then Mr. Mease is naturally desirous, if possible, of winning the Kingston challenge vase, and he means to have a good try for it this year. He was second to Mr. Carpenter, Major Collis Browne's gardener, at

Byfleet last year, and as both mean to do their very best on the 8th naturally the competition is looked forward to with exceeding interest. Both growers are real Greeks, and when they meet there will be a worthy tug of war.

Mr. Mease's collection of Chrysanthemum plants, disbudded for the production of show flowers, hardly exceeds 250—not a large batch, but he selects the best of their kinds, because any man of experience knows that certain sorts are far more reliable than others, and are better qualified to give the best show blooms. I found his finest plants in a broad span-roof house standing on the side stages, and a raised centre bed that naturally threw up the flowers high, and therefore a temporary path was made round the house by placing boards across on the level of the stages, so that visitors or growers were enabled to get a good look at the blooms.

So far as appearances go, these are fine and full of promise. Naturally it would be easy to say they will be hard to beat, but the competitions reveal many secrets hitherto unknown. Those who have seen Mr. Mease's blooms in the past, especially his splendid flowers at Wimbledon last year, admit that he can produce fine blooms. I should add that some 200 plants in large pots are grown for conservatory decoration and the furnishing of cut bloom. Of newer varieties, J. Stanborough Dibben, only 3½ feet in height, is carrying huge blooms of a rich orange buff colour. Colonel W. Smith, somewhat resembling the preceding, but has broader and rather darker-hued florets, is also in very fine form. No wonder larger show boards are needed when there are types of the new Japs, now being so abundantly introduced. G. C. Schwabe is a very striking incurved Jap, florets broad, of a reddish terra cotta hue on the golden reverse. Very fine also is the older Florence Davis, the centres in its earlier stages being very green, but becomes white later. Vivian Morel shows on same plants how it varies in colour, some buds giving very fine pink flowers, others pure white ones.

It seems evident that assumed white sports will have to be regarded with considerable dubiety. A very fine white is Vice-President Audiguier, the florets broadish and long, the outer ones having a pleasing pink tinge. Sunflower is very beautiful, and Mr. Cannell, another of the finest yellows when good, is opening well. Mr. Mease has a great liking for Cannell's Eynsford White, which is a very beautiful variety. Cesare Costa, a rich deep crimson, is very fine; so also is the somewhat early Gloire de Rocher, reddish buff with golden centre. W. H. Lincoln, very fine, too, is another of the grandest yellows; and Puritan, a beautiful flesh tinted white. These are but a few of the many varieties grown, but interest attaches far more to novelties now than to older varieties. Of incurved forms these are all the best. I only mention Mons. Bahuant, fine, and not too early for Kingston; Robert Cannell, golden buff, a grand variety, but subject to damp very much; and Ada Price, a beautiful incurved pink, not large, but very pleasing. Naturally in mixed classes the incurved flowers have to be first class to compete with the Japanese, which now are so fine. Any additions to the incurved section, especially of good sized blooms, is to be regarded with favour.

At Downside myriads of things are grown, and all well. In the score of houses devoted to plants there is not a poor or badly grown plant. Foliage plants, though not large, are really remarkably good. Crotons, Acalyphas, and Dracenas have very fine colouring; Ferns are splendid. One gigantic Microlepia is fully 10 feet across. Gardenias, both in pots and planted out in a bed, are clean and in the finest condition. Winter-blooming Carnations are very largely grown and in capital form. Zonal Pelargoniums, some 250 plants, are a perfect mass of bloom in diverse colours, a wonderful glow of colour for the time of year. Double Primulas are a great feature, especially Marchioness of Exeter, pure white. This is finely grown and flowered profusely. Even a collection of Rivers' best flavoured Oranges in pots are grown in one house, the varieties having the reputation of greatly excelling the best imported fruits in flavour. That is, at least, Mr. Mease's opinion. Hydrangeas on single stems carry immense heads, some fully 3 feet in circumference. These are from one-year-old cuttings.

Roses are very largely grown, although all the beds or borders in which the plants are have to be specially made, because the surface soil on the chalk is very shallow. When, however, first-prize flowers, chiefly of Teas, are found from Downside at the James Street Drill Hall and the Crystal Palace it is certain that the culture is good. In a very large Rose garden near the mansion one portion is devoted to Hybrid Perpetuals, one to Teas, and one to garden Roses in great variety, especially the free blooming Polyanthas. Mr. Mease prefers Teas outdoors on standards as giving much the finest blooms. These both stock and heads are protected with Fern during the winter. In a long span house, formerly devoted to Orchids, Tea Roses are now growing in beds and doing well. From this house last summer came the twenty-four fine blooms which placed Mr. Mease first at the Drill Hall, Westminster.—A. D.

COLONEL SMITH.

SOME attention was excited by the Japanese Colonel Smith when exhibited by Messrs. Cannell & Sons at the Crystal Palace show last year, but few, probably, imagined it would turn out so magnificent an acquisition as it has already proved itself to be. The Swanley growers have been the means of bringing several of our finest varieties into public notice, and the introduction of Colonel Smith is something for which we owe them a special debt of gratitude. It was one of a set of ten sent over by Mr. Spaulding, and soon turned out to be a gem

of the first water. Its merits are not restricted to beauty of bloom. The plant is not of the dwarfiest growth, being of medium height, but is very strong and sturdy, carrying splendid foliage.

The flowers are of the largest exhibition size, and a special character

imposing appearance. Probably flowers exceeding this in size will be produced in due course. The colour is a rich bronzy yellow, and the florets are tipped with gold. The variety is represented in the engraving (fig. 57), which was prepared from a photograph of one of Messrs.

FIG. 57.—CHRYSANthemum COLONEL SMITH.

of them is a peculiar twist of the florets, which curve round towards the centre. This is very strongly marked in the early stages of development, and is not altogether lost when the flower has filled up. Good examples are 8 inches across by 5 inches deep, presenting a massive and

Cannell's flowers. They have a fine stock of the variety, and it is one of the most striking objects in their large collection. Colonel Smith is an acquisition such as is rarely secured, and every collection should embrace it.—W. P. W

THE WHITE VIVIAND MOREL CHRYSANTHEMUM.

I NOTICE Mr. Woodcock's account of this on page 379, but I find this variety varies very much in colour according to the time the buds are taken. Those taken very early come either white or very pale pink, while other flowers on the same plant taken later are deep pink in colour, so that great care should be exercised to insure the new white variety being quite true before it is distributed. I find some of the white Etoile de Lyon, syn. Miss Lilian Cope, are this season proving to be nothing but the old variety of Etoile de Lyon under a new name. This is a decided error, and very disappointing. We want new varieties if they are true and distinct and better than those already in commerce; but there seems too much haste in flooding the country with fresh names which have not had sufficient trial to decide whether they are sterling acquisitions.—W. H. DIVERS, *Ketton Hall Gardens, Stamford.*

[We understand that the Judges at the Crystal Palace Show did not feel justified in certificating a white sport of Vivian Morel on the ground that its constancy had not been sufficiently tested.]

SOUTHWARK PARK.

This park is situated in one of the most thickly populated districts in the metropolis, and it is greatly appreciated by the inhabitants of the neighbourhood. A Show of Chrysanthemums has been prepared here, and though the plants on the occasion of our visit were not yet at their best, there were many fine flowers to be seen, which reflect much credit on Mr. Bailey, the Superintendent, and to his grower, Mr. Fransham.

Upwards of 2000 plants are staged, and all of them are in excellent condition, they being of good habit, possessing strong and substantial foliage. Amongst the most prominent in the collection are Lady Selborne, Princess Teck, Mont Blanc, Fleure de Marie, Lord Wolseley, Lord Beaconsfield, Lady Hardinge, Etoile de Lyon, Refulgens, Louis Boehmer, Val d'Andorre (especially good), Gloire Rayonnante, Mdle. Lacroix, Edwin Molyneux, J. R. Pearson, Elaine, Edouard Audiguier, Gloria Mundi, Mont Blanc, Baronne de Prailly, Stanstead Surprise, Avalanche, Gorgeous, Charlotte de Montcabrier, Elsie Jordan, Puritan, Empress of India, Bouquet de Dame, Mrs. J. Wright, John Salter, and Countess of Derby. There are many other varieties in flower, and the number of visitors proves how much the public likes to see such an Exhibition.

CHRYSANTHEMUM SHOWS.

SITTINGBOURNE.—NOVEMBER 2ND.

THERE is no more able and persevering a body of gardeners, professional and amateur, than those composing the Sittingbourne and Milton Society. The late season militated heavily against the Chrysanthemum portion of their Show on the above date, but it did not interfere with the fruit and vegetables, which formed a magnificent display, and spoke eloquently of their ability. In such a pronounced fruit-growing district fine fruit is looked for as a matter of course, but the extent and quality of the vegetable section was astonishing.

The classes were too numerous to admit of details being given, but it should be mentioned that fruit was splendidly shown by Messrs. Aitken and Dowdeswell (on the promising condition of whose Vines a *Journal* correspondent commented in spring), A. J. Thomas, Axel, E. Thomas, Brook and others. Vegetables were shown finely by Messrs. Chopping (who exhibited Potatoes so well at Earl's Court), Dowdeswell, Mannoeh, Fountain, Kennett, Aitken and many others. Messrs. Warrington, Dowdeswell, Aitken, E. Thomas, Chopping, Lurcurek, Edwards, Clinch, Kennett, and Fountain were conspicuous with plants and flowers. The stove and greenhouse plants staged by Messrs. Warrington and Dowdeswell were in very fine condition. On the exhibitors named, as also on others for whose names space cannot be found, the utmost credit was reflected, while Mr. Fryer, the Secretary, did his work thoroughly well.

Our Sittingbourne friends are going rapidly ahead, and evidently mean to be at the top of the tree with fruit and vegetables. The Society has an excellent President in G. Payne, Esq., the distinguished archaeologist, and the Treasurer, Mr. T. Henham, together with a good working Committee, are active in its interests.

ASCOT.—NOVEMBER 2ND AND 3RD.

THE ninth annual Exhibition, held as usual in the grand stand, was in every way a success. Groups of Chrysanthemums are always well shown here, but were not quite so numerous on this occasion, though the quality was equal to former years. Mr. Cowie, gardener to Kere L. Oliver, Esq., Whitmore Lodge, won easily in the large class with a grand bank of plants. Those in the front row were not more than 2 feet high, yet carried grand blooms and foliage. Mr. May, gardener to the Hon. Lady Isabella Krane, Sunningdale, was second; and Mr. Lane, gardener to Miss J. Durning Smith, Ascot, third. Mr. H. While, gardener to the Marchioness of Conyngham, Ascot, secured first award in the smaller class with a most creditable arrangement of both plants and blooms; Mr. Edge, gardener to Lord Harlech, Tedworth, Slough, being second.

Groups of miscellaneous plants are always a feature here. This season the winning exhibit was, perhaps, an improvement on former years. Mr. Thorne, gardener to Major Joicey, was first. For six plants of white Cyclamen, Mr. Woodhouse, gardener to Miss H. Belcher Spring, was placed first with really grand examples.

Cut blooms were quite up to the average in the Japanese section; but the lateness of the season was apparent in the incurved blooms, which showed a want of development. A silver cup was offered for

thirty-six distinct varieties, half to be incurved and the remainder Japanese, which Mr. Page, gardener to H. P. Leschallas, Esq., Bagshot, won rather easily. The Japanese were Vivian Morel, Miss A. Hartzhorn, Edwin Molyneux, M. Bernard, Stanstead White, Puritan, Sunflower, Mrs. F. Jameson, Madame J. Laing, Avalanche, W. Tricker, Margaret Marrouch, Vice-President Audiguier, W. W. Coles, Mr. E. Beckett, Val d'Andorre, and Mdme. B. Pigny. Incurved, Golden Queen of England, Queen of England, Mous. R. Bahuant, Empress of India, Lord Alcester, Lord Wolseley, Mdme. Darrier, Prince Alfred, Princess of Wales, Golden Empress, John Doughty, Princess Beatrice, Violet Tomlin, Pink Venus, John Salter, and Lady Hardinge. Mr. Lane was second with a creditable display. Mr. Page was also successful with twenty-four incurved, showing medium-sized neat blooms. Mr. Lane was second here also. Mr. Popple, gardener to the Hon. Lady Cowell, Stepney, Wood End, secured the premier award for one dozen incurved blooms. Mr. Edge was second. For six incurved, Mr. Woodhouse won with a creditable display.

The class for twelve Japanese was productive of strong competition and good quality of flower. Mr. Cowie was first; and Mr. Cole, gardener to E. Hamilton, Esq., Charteris, second. For six Japanese Mr. Popple won; Mr. Bird, gardener to D. G. Barnett, Esq., King's Beeches, being second. In the class for twelve distinct blooms of reflexed varieties Mr. May won the silver cup with medium sized yet full blooms of exquisite colour, Cullingfordi, King of Crimson, Chevalier Damage, Mrs. Neville, Distinction, and Pink Christine being the most noteworthy. Mrs. Cole was second. Six full blooms of Empress of India won for Mr. Joy, gardener to Mrs. Entwistle, Sunninghill, the first prize for that number of the Queen family only. Mr. Page was second with Golden Queen of England.

Avalanche was staged in splendid condition by Mr. Page for six any one variety white; Mr. Thorne being second with the same kind. For six any colour but white Mr. Joy won with richly coloured blooms of Edwin Molyneux, Mr. Page following with Vivian Morel; and Mrs. Cole, with Sunflower, secured third place. A class was provided for twelve blooms, to be staged with not less than 9 inches of stem above the board, with foliage attached. Mr. Lane was first with a really good exhibit, and Mr. Woodhouse second. The premier incurved bloom was Madame Darrier in Mr. Page's eup stand, while Vivian Morel secured a like honour in the Japanese section.

Fruit and vegetables were well shown in the numerous classes provided, though pressure on our space forbids more than a bare reference being made to this part of a compact Exhibition, where quality was the preponderating point all through.

PORTSMOUTH.—NOVEMBER 2ND, 3RD, AND 4TH.

THIS famous southern Exhibition, taken as a whole, fully maintained the reputation it has hitherto held. There was a slight falling off in the number and quality of the incurved blooms, owing entirely to the lateness of the season, but the Japanese were quite up to the average. The plant classes, however, were but moderately filled.

Cut blooms were the leading feature. No less than 1200 were staged, exclusive of Pompons, singles, and the fimbriated section, for which a class has been formed specially for them. Six entered for the handsome prizes of £10 for the first, £7 for the second, and £5 for third. Forty-eight blooms were required, half to be incurved and the remainder Japanese, in not less than eighteen varieties of each, not more than two of one kind. Mr. N. Molyneux, gardener to J. C. Garnier, Esq., Rooksbury Park, Wickham, Fareham, won somewhat easily. The Japanese very fine, heavy and fresh; the incurved were neat, but not large. The following varieties were shown—Japanese: Etoile de Lyon (2), Gloire du Rocher, Boule d'Or (2), Vivian Morel (2), Condor, Mrs. C. Wheeler, Florence Davis, Miss F. Spaulding, Alberic Lunden (2), Mdle. Marie Hoste (2), Val d'Andorre, Avalanche, Vice-President Audiguier, Puritan, Princess May (2), seedling, white, with narrow florets, of much substance and beauty; E. Molyneux, Mrs. F. Jameson, and W. H. Lincoln. Incurved: Golden Queen of England (2), Violet Tomlin (2), Wm. Shipman, Empress of India, Princess Beatrice, Golden Empress, Jeanned'Arc, Mr. R. Mudie (2), Mons. R. Bahuant (2), Lord Alcester, Miss M. A. Haggas, Lady Hardinge, Mrs. Heale, Madame Darrier (2), Princess of Wales, Empress Eugénie, Novelty, Mrs. S. Coleman, and Mrs. Mitchell, a buff sport from Empress Eugénie lightly striped with purple. Mr. W. Neville, gardener to F. W. Flight, Cornstiles, Twyford, was second, and Mr. Inglefield, gardener to Sir J. Kelk, Bart., Tedworth, Marlborough, third.

The first prize for twenty-four, twelve Japanese and twelve incurved, distinct, was won easily by Mr. Inglefield with a good stand. The varieties were:—Japanese: Vivian Morel, M. J. M. Pigny, Stanstead Surprise, W. H. Lincoln, W. Tricker, Stanstead White, Gloire de Rocher, Sunflower, Avalanche, Puritan, Madame Laing, and Florence Davis. Incurved: Golden Queen of England, Golden Empress, Mons. Bahuant, Lord Alcester, J. Doughty, Prince Alfred, Empress of India, Lord Wolseley, Miss M. A. Haggas, Violet Tomlin, Jeanne d'Arc, and Empress Eugénie. Mr. N. Molyneux was a good second with heavier Japanese, but smaller incurved; and Mr. Penford, gardener to Sir F. Fitz-Wygram, Bart., M.P., Lee Park, Havant, third. Mr. Agate, Havant, was first with twelve Japanese, showing heavy fresh blooms. Mr. G. Hawkins, gardener to E. Laphorn, Esq., Gosport, was second; and Mr. R. Woodfine, gardener to Major Boyd, Emsworth House, Emsworth, third. Mr. Hawkins was successful for twelve incurved, staging medium sized but neat examples of the leading varieties. Mr. C. Steptoe, gardener to G. A. Gale, Esq., Horndean, was second; and Mr. W. Hunt, gardener to Sir William Pink, Shrover Hall, Cosham, third.

Reflexed varieties were fairly well represented. In the class for twelve, not less than eight varieties, Mr. H. Adams, gardener to T. S. Edgcombe, Esq., Hinton House, Elm Grove, Southsea, secured the premier award, followed by Messrs. Penford and Agate in the order named. Mr. Penford won easily for twelve Anemones, in not less than six varieties, with an excellent stand. Mr. Steptoe was second, and Mr. H. Adams third. Pompons were bright and numerous staged. Mr. Hatch, gardener to the Victoria Park Committee, was first for twelve bunches; Mr. Agate second; and Mr. Snook, 5, Fitzroy Street, Landport, third.

Fimbriated varieties are encouraged here, and very pretty they look shown in bunches of three blooms. Mr. Hatch secured first honours with a capital display, conspicuous amongst others being Scapin, Chardonnet, and Croesus. Nowhere is the single-flowered section so well represented as here. Mr. Agate staged the best twelve bunches, three blooms to a bunch. The most effective sorts were Jane, David Windsor, Jenny Lind, Kate, Golden Star, Mary Anderson, Bessie Conway, Effie, and Miss M. Wilde. Mr. W. Wells, Earlsfield Nurseries, Earlswood, Redhill, was second, and Mr. Hatch third.

Six Japanese, any one variety, were contributed by six competitors. Avalanche, full and fresh from Mr. N. Molyneux, secured the first prize; Mr. Agate with the same variety, being second; Mr. J. Tavener, gardener to Sir A. K. Macdonald, Bart., Liphook, was third. Princess of Wales extremely neat, placed Mr. W. Hunt first in the class for six incurved blooms; Messrs. Hawkins and N. Molyneux following. The premier incurved was Golden Empress, belonging to Mr. Inglefield, while Stanstead White, shown by Mr. Agate, was the best Japanese. Numerous prizes were offered for growers in Portsea Island only and for amateurs, all of which were keenly contested, many excellent stands being staged.

Messrs. Perkins & Sons, Coventry, were successful with a bouquet of Chrysanthemums and Ferns; Mr. F. Mills, 13, Florence Road, Southsea, being second. For an epergne dressed with berries and autumn foliage, Mrs. Conway, Havant, was first; and Miss O. Winch, Brockhurst, Gosport, was second. Mrs. Conway also had the best arranged table and epergne with Chrysanthemums.

For the best group in a space 50 square feet, arranged for effect, Mr. Hatch was an easy winner, Mr. Hunt being second. Prizes were also offered for a group of Chrysanthemums interspersed with foliage plants. Mr. J. Burridge, North End Nursery, Portsmouth, was first; and Mr. E. K. Harvey, 63, Hanover Street, Portsea, second. There was a splendid display of plants suitable for table decoration. For twelve Mr. J. Amys, gardener to the Hon. Mrs. Elliott Yorke, Hamble Cliff, Netley, was first; and Mr. Hatch was first for twelve double Primulas.

Fruit and vegetables were excellent. Grapes were best shown by Messrs. Grigg, Chalk, Hall, R. G. Hargreaves, Esq., Cuffnells, Lindhurst, and Mr. H. Becker, Jersey, the latter staging Trebbiano, weighing 10 lbs., in the class for the heaviest bunch. Apples and Pears were well shown by Mr. Becker; Messrs. Cheal & Sons, Crawley; Mr. E. Webster, East Street, Petworth; and Mr. G. Goldsmith, gardener to Sir E. G. Loder, Horsham. Vegetables were shown in splendid condition by Mr. G. Hawkins, Mr. Inglefield, and Mr. G. Best, gardener to Mrs. Chute, The Vyne, Basingstoke.

The Duke and Duchess of Connaught visited the Show during the afternoon, and took much interest in the various exhibits.

WELLS.—NOVEMBER 3RD AND 4TH.

THE seventh annual Exhibition of this Society was held in the Town Hall, Wells, on the above date. Groups of plants, to consist principally of Chrysanthemums, have always been a leading feature at Wells. The premier group was staged by Mr. J. B. Payne, gardener to the Lord Bishop of Bath and Wells. This fine group included magnificent blooms of Edwin Molyneux, Golden Dragon, Vivian Morel, and others. Poinsettias of a high order of merit, together with Palms, Crotons, Cordylines, Asparagus, Bouvardias, Epiphyllums, and Ferns, completed an imposing and well-balanced arrangement. Mr. O. Fewtrell, gardener to C. C. Tudway, Esq., was placed second, and Mr. H. Stokes, gardener to D. H. McLean, Esq., third. Cut blooms were numerous. In the class for twenty-four blooms, distinct, twelve incurved and twelve Japanese, Mr. Payne was first, staging incurved Empress of India, Alfred Lynne, Miss Haggas, Mons. Bahuant, John Lambert, Jeanne d'Arc, Robert Cannell, A. Salter, Lord Alcester, Queen of England, Mr. Bunn, and John Doughty. Japanese—Vivian Morel, Avalanche, Edwin Molyneux, W. H. Lincoln, Annie Clibran, Louise Boehmer, W. W. Coles, Kioto, Mons. Bernard, Miss Florence Davis, Gloire du Rocher, and Stanstead White. Mr. O. Fewtrell was second. The National Chrysanthemum Society's certificates were awarded to Mr. J. B. Payne for the best bloom in the Show, a superb Jeanne d'Arc in his premier stand of twenty-four; and to Mr. W. Potter for the best specimen plant, a good Prince Alfred. There was an imposing display of table decorations, also fruit and vegetables were admirably represented. The Show was a great and gratifying success.

HIGHGATE.—NOVEMBER 3RD AND 4TH.

THE annual Exhibition of the Highgate Chrysanthemum Society was held in the Northfield Hall on the above dates. There was an excellent display, cut blooms being good, whilst groups and miscellaneous plants made a charming effect.

The principal class was for thirty-six blooms, eighteen incurved and the same number of Japanese, and Mr. Rowbottom, gardener to H. R. Williams, Esq., Hornsey, N., was awarded first prize. The incurved blooms shown in this stand were good, but the Japanese were decidedly better. The exhibit included the following varieties:—Incurved:

Empress of India, Golden Jardin, A. Salter, Golden Empress, Lord Wolsley, Mrs. G. Rundle, Mons. R. Bahuant, Jeanne d'Arc, Mrs. W. Shipman, Golden Queen, Madame Darrier (very good), Mrs. Dixon, Lord Alcester, John Salter, Mrs. Heale, Queen of England, and Mr. Bunn. Japanese: Sunflower, Felix Cassagneau, Coronet, Puritan, Alberic Lunden, Madame E. Labat, E. Molyneux, Florence Davis, Golden Dragon, W. H. Lincoln, Vivian Morel, Avalanche, Etoile de Lyon, J. S. Dibben, Jean Delaux, Mrs. F. Jameson, and W. Tricker. Mr. Rowbottom also secured a special first prize of a silver challenge cup for twenty-four blooms, twelve incurved and twelve Japanese. The flowers in this stand were perhaps the best in the Show. The incurved varieties were better developed than in the first mentioned stand, Mons. R. Bahuant and Madame Darrier being specially good. Of the Japanese E. W. Clarke, Alberic Lunden, Sunflower, and W. Tricker were most conspicuous. Mr. Rowbottom was again first for twenty-four Japanese, distinct, showing Vivian Morel and W. H. Lincoln in splendid condition. Mr. J. Brookes, gardener to W. Reynolds, Esq., The Grove, Highgate, was second in this class; the third prize going to Mr. J. Sandford, gardener to G. W. Wright-Ingle, Esq., Wood House, North Finchley.

In a special class for twelve Japanese Mr. H. A. Page, gardener to F. Crisp, Esq., White House, New Southgate, was placed first with a stand of grand blooms, Sunflower, Mrs. F. Jameson, Lizzie Cartledge, and Louis Boehmer being particularly good. Mr. J. Brookes was second, and Mr. D. Hayler third. Mr. Page also had the best six Japs distinct, amongst which were splendid blooms of Vivian Morel and Sunflower. Mr. Rowbottom was a close second. The latter exhibitor, however, secured the first prize for six white Japanese, showing well-developed blooms of Florence Davis, Puritan, Stanstead White, Mrs. E. Beckett, Miss Anna Hartzhorn, and Mdle. Marie Hoste.

The incurved varieties were by no means equal to the Japanese in quality, but some fair blooms were staged in the various classes. Mr. T. L. Turk, gardener to F. Boney, Esq., Highgate, was first for twelve blooms, which included neat examples of Mons. R. Bahuant, Mrs. Heale, Empress of India, and Miss M. A. Haggas. Mr. Turk also secured the leading position for six blooms. For twelve incurved blooms, six varieties, Mr. H. H. Page gained premier honours, his stand being made up with Queen of England, Alfred Salter, Refulgens, Empress of India, J. Doughty, and Jeanne d'Arc. Mr. Rowbottom was second, and Mr. Hayler third. Mr. Rowbottom, however, had the best stand of six blooms, one variety, showing Madame Darrier in splendid condition. Mr. Page was second with Mons. R. Bahuant.

Groups and specimen plants were best shown by Mr. J. Brookes, and there was a good display of amateur classes. Messrs. B. S. Williams and Son, Upper Holloway, sent a not-for-competition group of foliage and flowering plants, as also did Messrs. Cutbush & Sons, Highgate, the latter firm likewise showing a collection of well coloured Apples.

GRIMSBY AND DISTRICT.—NOVEMBER 3RD AND 4TH.

THE third annual Show was held in the Town Hall, and was a success. Considering the early date there were some most noteworthy exhibits, although some of the incurved were badly finished.

The principal class for cut blooms was one for forty-eight, twenty-four of each, in not less than eighteen varieties. The first prize went to Mr. G. A. Carr, gardener to W. Welton, Esq., Watham Grove, who won the challenge cup for the second time, it being now his own property. The following varieties comprised his stands. Japanese: Louis Boehmer, premier bloom (2), Bouquet des Dames (2), Carew Underwood (2), Vivian Morel (2), Puritan, Gloriosum, C. Beauregard (2), Avalanche (2), A. Clibran, S. Owen, Elaine, Coronet, G. Daniels, T. Stephenson, A. Hardy, Gloire du Rocher. Incurved: Empress of India (2), Mons. R. Bahuant (2), Golden Empress (2), Lord Alcester (2), Emily Dale, Camille Flammarion (2), Queen of England (2), Refulgens (2), Madame Darrier (a most lovely bloom), Jardin des Plantes, A. Lyne, Mdle. E. Bertin, Mr. Bunn, Novelty, Nil Desperandum, Madame Nante, and Jeanne d'Arc. The second prize went to Sir Henry Bennett.

For twenty-four blooms, twelve of each, in not less than nine varieties, the first prize, consisting of a silver cup value 3 guineas, and £1 added, went to Mr. Granville Southwell, Waltham Hall, for an excellent stand. His incurved were in grand form, showing high cultivation. His principal blooms were Vivian Morel, Lilian B. Bird, Sunflower, Avalanche, Stanstead White. Incurved: Queen of England, Mons. R. Bahuant, Lord Alcester, A. Salter, Empress of India (champion incurved in the Show, and a grand bloom). The second prize was taken by Mr. G. Smith, The Elms, Grimsby.

For twelve Japanese Sir H. Bennett was first; with very good blooms indeed. Mr. G. A. Carr was second, and Mr. John Clark third. Mr. Granville Southwell was again first for twelve incurved with some good heavy blooms. Mr. G. Smith was second with even flowers. Mr. G. A. Carr gained the first prize for twelve reflexed, Mr. J. Clark being second, and Mrs. Grange, The Cedars, Lacey, third.

Groups were a great feature, and excelled all previous exhibits. The first prize was awarded to Mr. F. Jell, gardener to Mrs. Grange, for a most magnificent group. The second prize went to Sir H. Bennett, and the third to Mr. Needham, Lime Tree Nurseries, Grimsby.

CRYSTAL PALACE.—NOVEMBER 4TH AND 5TH.

THE Palace Show being the earliest of the principal metropolitan exhibitions, naturally suffered from the lateness of the season. It was not so extensive as usual, nor were the flowers on the whole up to the average in quality. With the exception of Messrs. Drover's blooms in the principal class the incurved were much below the usual standard. There were size and substance about them, but most of them were rough

and coarse, lacking fulness and finish. The Farcham exhibitors managed to get an admirable stand together. Japanese were very good throughout, but the minor sections were not well represented. The groups deserve a special word of praise. Those of Messrs. Reid & Bornemann and Messrs. Carter & Co. were both very fine indeed.

There were six entries in the leading class, that for twenty-four Japanese and twenty-four incurved, and, considering the season, this number may be taken as highly satisfactory. The first prize went to Messrs. W. & G. Drover, Farcham, whose incurved were marvellously good, bearing in mind how backward the flowers are generally. Their Japanese were also excellent, and altogether the stand was a surprisingly strong one. The back row Japanese were:—Mrs. Wheeler, Vivand Morel (2), Florence Davis (a huge flower), Mrs. Falconer Jamieson, Etoile de Lyon, Edwin Molyneux, and Puritan. Middle row: Mons. Bernard, Mrs. F. Jameson, Mrs. E. W. Clarke (2), Mrs. Wheeler, Sunflower, Miss A. Hartzhorn, and J. S. Dibben. Front row: Mons. E. A. Carrière, E. Molyneux, Avalanche, Gloire du Rocher, Pelican, Mons. Bernard, Sarah Owen, and Condor. The back row incurved were Mons. Bahuant, John Lambert (2, very fine), Alfred Salter, Queen of England (2), Lord Alcester (splendid), and Golden Empress. Middle row: Princess of Wales, Lord Wolseley (2), Mons. Darrier (2), Prince Alfred, John Doughty, and Novelty. Front row: Prince Alfred, Jeanne d'Arc, Violet Tomlin, Mrs. Shipman, Nil Desperandum, Alfred Lyne, Prince of Wales, and Princess of Teck. The second prize fell to Mr. C. J. Salter, gardener to T. B. Haywood, Esq., Woodhatch Lodge, Reigate, whose Japanese were very fine, but the incurved much in the rear of Messrs. Drover's. The best of the former were Eynsford White, Edwin Beckett, E. Molyneux, and Vivand Morel; of the latter Empress of India, Queen of England, and Mons. Bahuant. Mr. Whittle, gardener to C. H. Goschen, Esq., Ballards, Addington, Croydon, was third with small incurved and medium Japanese, while Messrs. H. Ray & Co., Teynham, were fourth.

There were five competitors with eighteen incurved, and the winner was Mr. J. Douglas, gardener to Mrs. Whitbourn, Great Gearies, Ilford. His flowers were not of the highest quality, but considering the season were good. One or two lacked weight, and others were hardly filled. The varieties were as follows:—Back row: Golden Empress, John Doughty (very good), Emily Dale, Queen of England, Lord Alcester, and Empress of India. Middle row: Mons. Bahuant, Mrs. Coleman, Princess of Wales, Lord Wolseley, Alfred Salter, and Miss Haggas. Front row: Mrs. Heale, Violet Tomlin, Mrs. Shipman, Jeanne d'Arc, Ami Hoste, and Prince Alfred. Messrs. W. & G. Drover were second with flowers far below their others in quality. The back row blooms were coarse, and perhaps the best examples were Nil Desperandum, Mrs. Shipman, Novelty and Mons. Darrier. The latter was a beautiful flower. Mr. Cox, gardener to J. Trotter, Esq., Brickendon Grange, Hertford, was third; and Mr. Shoesmith, gardener to M. Hodgson, Esq., Shirley Cottage, Croydon, fourth. The best of five stands of twelve came from Mr. W. Howe, gardener to H. Tate, Esq., J.P., Park Hill, Streatham Common, whose flowers were of fair quality, but comprising no specially good examples. Lord Wolseley was perhaps the best. Mr. George Carpenter, gardener to Major Collis Browne, Broad Oaks, Byfleet, was second with large and substantial but somewhat rough flowers, Prince Alfred being the best. Mr. Collins, gardener to J. W. Carlisle, Esq., Hertford, was third, and Mr. A. Turner, gardener to C. F. Murray, Esq., Woodcote Hall, Epsom, fourth. Mr. Carpenter won with six of one variety, having a splendid box of Refulgens, the flowers being smooth, substantial, and very rich in colour. Mr. Shoesmith was second with Empress of India, Mr. S. Badworth third with Golden Empress, and Mr. A. Turner fourth with Lord Wolseley.

The Japanese were much more numerous than the incurved, as was expected. There were eight stands of eighteen blooms, and the best was that staged by Mr. Cox, whose flowers were effectively displayed on a large board. They were excellent examples, being large, fresh, and well coloured. The back row flowers were Etoile de Lyon (very fine) Boule d'Or, Vivand Morel (richly coloured), Avalanche (very fine), Edwin Molyneux, and Stanstead White. Middle row: Mons. Bernard (very fine), Miss Anna Hartzhorn, Louis Boehmer, Sunflower, Puritan, and W. H. Lincoln. Front row: Mrs. F. A. Spaulding, Vice-president Audiguier, Mrs. G. C. Schwabe, Mr. A. H. Neve, Gloire du Rocher and Mrs. E. W. Clarke. Mr. Douglas also had an excellent stand, and was placed second. He had Vivand Morel in splendid condition, and Mrs. F. Jameson was also very fine. Mr. Glen, Worth Park, Crawley was third, his Vivand Morel and Mrs. F. Jameson being the best blooms. Mr. Carpenter was fourth. Mr. Felgate, gardener to the Duchess of Wellington, Bushill, Walton-on-Thames, was first with twelve, his varieties being Sunflower, Leon Fraiche, Stanstead White, E. Molyneux, Condor, W. H. Lincoln, Vivand Morel, Avalanche (very fine), Puritan (beautiful), Cesare Costa, Boule d'Or, and Louis Boehmer. Mr. Howe was second with medium flowers; Mr. Ridge, gardener to S. Edy, Esq., Oatlands Lodge, Weybridge, third; and Mr. Robinson, gardener to W. Lawrence, Esq., Elmsfield, Hollingbourne, fourth. Two others competed. With six of one variety Mr. Howe was first. He had a beautiful box of Sunflower. Mr. Cox was second with Avalanche in splendid condition, Mr. Collins was third with Vivand Morel, and Mr. Ridge fourth with Sunflower, six others competing.

There were two stands of eighteen reflexed and Japanese reflexed, Mr. Salter winning with very clean, fresh flowers, and Mr. Felgate being second. Mr. Glen was the only exhibitor of Anemones and Japanese Anemones, and was deservedly placed first for an excellent box. Mr. J. Knapp, gardener to F. W. Amsden, Esq., Croydon, was placed first for twelve varieties of Pompons in threes with small neat flowers, larger

examples from Mr. Salter being second. The latter won with Pompon Anemones, Mr. Knapp here being second. Mr. Carpenter was placed first for twelve single varieties in threes, and Mr. Wells second. Both were charming boxes.

The groups were magnificent. That from Messrs. Reid & Bornemann was one of the finest ever put up. Colonel Smith, Vivand Morel, Sunflower, E. Molyneux, Avalanche, and Val d'Andorre were all effectively employed. The blooms throughout were fine, the colours effectively displayed, and the group finished by tiers of dwarf plants, ranging from 6 to 18 inches high, but all carrying good blooms. Messrs. Carter & Co. also arranged a splendid group, the plants being healthy, the blooms fine, and the colours beautifully blended. It was their best effort in grouping, and they deservedly received the second prize. Messrs. Mobsby & Son were third. Mr. T. W. Wilks, gardener to C. Ralph, Esq., Upper Norwood, won in the amateurs' class; Mr. Fry, gardener to W. Aste, Esq., Streatham Common, was second; and Mr. Carr, gardener to Mrs. Stephenson Clarke, third.

Trained plants formed a bold block of colour arranged by themselves. Mr. Cherry, gardener to Mrs. Gabriel, Streatham, was first with six trained incurved, staging healthy and well-flowered plants. Mr. Hughes, gardener to G. R. Higgins, Esq., Eastlands, Dulwich, was first with Pompons, having model plants, large, healthy, and well bloomed. Mr. Wesker, gardener to A. Heaver, Esq., Upper Tooting, won with Japanese, and other prizes went to Messrs. Wesker, Carr, and Cherry.

FIG. 58.—MR. W. G. HEAD.

First-class certificates were awarded to Colonel Smith, the grand new bronzy Japanese, which was shown in splendid condition by Messrs. Pitcher & Manda; G. W. Childs, a fine Japanese reflexed of dwarf growth with very broad florets of a rich lustrous purplish crimson, shown by the same firm, and Mdle. Marie Hoste, white or white shaded with lilac, a Japanese with broad evenly folded florets. Certificates would also have perhaps been awarded to Lord Brooke, G. C. Schwabe, and Mrs. Harman Payne had more than one bloom of each been staged. A first-class certificate was also awarded to the "clipper" cup and tube, for which Messrs. E. D. Shuttleworth & Co. are the wholesale agents. This fits in a circular metal ring screwed into the hole in the board, and the tube can be fixed at any height by simply pushing it up from below, so that it is not necessary to touch the flower.

Mr. W. Wells exhibited cut blooms of new and standard varieties, including Mrs. W. R. Wells, the white form of Vivand Morel, and a Japanese named Pride of Earlswood, a flower of the Avalanche build, but soft rose in colour. Messrs. Pitcher & Manda had a collection of novelties which excited considerable interest. The new large Anemone Delaware was very fine, and so was Colonel Smith. The Tribune is a pale yellow Japanese with very broad substantial florets. George W. Childs is very rich in colour, having a purplish suffusion and will probably secure a high place. Lord Brooke is very distinct in colour, and may prove to be an acquisition. It is yellow, with a deep bronze suffusion, and will perhaps be classed with the Japanese incurved. Mr. W. J. Godfrey exhibited his fine white Japanese Beauty of Exmouth, but their freshness had departed. Messrs. Cannell & Sons had some very fine blooms of Colonel Smith and Vivand Morel.

Messrs. Cheal & Sons had a splendid display of Apples and Pears, comprising about 130 dishes of large and highly coloured examples. Messrs. J. Peed & Sons had a collection of about 110 dishes of excellent fruit, the samples being large and bright. Messrs. J. Laing & Son had a similar number of dishes, and the fruit was conspicuous for its high quality. Messrs. E. D. Shuttleworth & Co. had a collection of table plants and choice Grasses, including *Carex europæa variegata* and *Bambusa Fortunei*, also a large group of Palms and fine-foliage plants, amongst which two splendid specimens of *Aralia Chabrieri* were very noteworthy. Messrs. Collins Bros. & Gabriel exhibited clusters of their excellent Tomato Challenger.

[We have much pleasure in publishing a portrait of Mr. W. G. Head (fig. 58), the Superintendent of the Crystal Palace Gardens, and under whose management the shows are so admirably arranged.]

KINGSTON-ON-THAMES.—NOVEMBER 8TH AND 9TH.

THE excellence of the Show at Kingston must have come somewhat as a surprise to those whose experience of Chrysanthemum exhibitions this season had led them to anticipate mediocre displays throughout the year. That it was hardly up to the average as respects the quality of the blooms, incurred at all events, would be readily admitted; nevertheless, collectively considered, it was an excellent and most attractive one. Cut blooms were very abundant, most of the classes being well filled. It will give an idea of the quality of the Japanese to state that in many cases the blooms were far too large for the boards, and it is to be hoped that exhibitors will not let another season go by without taking to the larger size. The success of Mr. Mease in the principal class was a confirmation of his form in the Liverpool district a few years ago. He was then a prominent winner at the northern shows, but up till this season had not displayed his full strength in the south. The competition for the challenge trophy has now assumed a most interesting phase, Messrs. C. Beckett, Carpenter, and Mease all having a share in the trophy. It can hardly be expected to escape another season. The chief interest of the Show still centres in this class, but there are numerous others in which good prizes are offered for cut blooms. Mr. Mease had the best incurred in the Show, and it will be a long time before his wonderful bloom of Mons. R. Bahuant is forgotten.

Specimen plants and groups were very good, the latter especially. Individual quality is desired in the groups at Kingston, and on this occasion it was present to a marked degree, the plants being splendidly grown. Trained plants were remarkably well bloomed considering the season. The arrangements were all of the best character, and the Show was thronged with visitors in the afternoon. Particulars of the principal awards are appended.

Mr. Mease, gardener to A. Tate, Esq., Downside, Leatherhead, won in the great class for the challenge vase, in which Messrs. Beckett and Carpenter had the half rights of a prior win. His Japanese were large and fine, and the incurred were very good on the whole, though hardly up to the average. His Japanese were Vivand Morel, J. S. Dibben (splendid), Vice-President Darquet, Danæ, Eynsford White, Sarah Owen, Condor, G. C. Schwabe, Miss Hartzhorn, E. Molyneux, Stanstead White, Sunflower, Geo. Daniels, Mrs. E. W. Clarke, Mdle. Lacroix, Etoile de Lyon, Florence Davis, Cesare Costa, Avalanche, Gloire du Rocher, Puritan, Colonel Smith, Mdle. Marie Hoste, and Japonaise. The incurred were Queen of England, Violet Tomlin, Lady Harding, Golden Empress, John Doughty, Lady Dorothy, Lord Wolseley, Empress of India, Jardin des Plantes, Miss Haggas, John Salter, Hero of Stoke Newington, Robt. Cannell, Mrs. Heale, Mrs. Shipman, Lord Alcester, Nil Desperandum, Princess of Teck, Princess of Wales, Mrs. Coleman, Lady Carey, Mons. R. Bahuant (a marvellous bloom), Jeanne d'Arc, and Empress Eugénie. Mr. Carpenter, gardener to Major Collis Browne, Broad Oaks, Byfleet, last year's winner, lost points both on the Japanese and incurred. The former were fresh, but somewhat undersized, and the latter lacked fulness and finish. Refulgens was very fine. Mr. C. Beckett, gardener to T. H. Bryant, Esq., Juniper Hill, Dorking, was third, his Japanese being heavy, but the incurred small. Violet Tomlin was far the best. The remaining prize went to Mr. A. Quarterman, gardener to C. E. Smith, Esq., Silvermere, Cobham, whose blooms were small, although very well finished.

Mr. Mease had an excellent stand of twenty-four incurred, although a few of the flowers were small. They were smooth, fresh, and bright. Mons. R. Bahuant, Empress of India, Lord Alcester, and Mrs. Coleman were a few of the best. Mr. W. Higgs, gardener to J. B. Hankey, Esq., Leatherhead, was a very good second. He had Empress of India and Lord Alcester in splendid condition. Mr. J. Thorne, gardener to A. E. Flood, Esq., Walton, was third with somewhat small flowers. Mr. Jinks, gardener to W. M. Grant, Esq., Cobham, had the best stand of twelve, and they were excellent, although one or two were undersized. Jeanne d'Arc was very good indeed. Mr. Hopkins, gardener to Mrs. Wadderspoon, Walton, was second with small but very neat flowers. Mr. A. Felgate, gardener to the Duchess of Wellington, Walton, third; and Mr. Wyatt, gardener to J. Perry, Esq., Caterham, fourth. Mr. Nuthall's first prize for six incurred went to Mr. Hawkes, gardener to G. B. Tate, Esq., Kingston, for a fair box, but comprising no specially good flowers. Mr. Ridge, gardener to C. S. Eady, Esq., Weybridge, was second. Mr. Carpenter showed Refulgens splendidly in the class for six of one variety, and won easily. Mr. Felgate was second with a beautiful box of Mrs. Heale, and Mr. Wyatt third with Queen of England. Messrs. Griffin, Dorsett, and Davis secured the prizes for district growers.

A splendid stand was exhibited by Mr. Woodgate, gardener to the Lady Wolverton, Kingston, for Messrs. Laing's special prize. It was for twelve each of Japanese and incurred, and the flowers throughout were excellent. Mr. Cawte, gardener to J. P. Robinson, Esq., Esher, was a close second. If anything his incurred were a trifle better than the others, but there was very little in it, and he lost ground on the Japanese. Mr. Holden, gardener to Mrs. Izod, Esher, was third. Major Collis Browne's prizes for Japanese, incurred, and Anemones were won by Messrs. Cawte (first with a beautiful box), Woodgate and Reed, gardener to E. Pettit, Esq. Mr. Sisson Hyde's first prize for Japanese, incurred and reflexed, was won by Mr. Mease with a beautiful box; a huge white bloom, described as a sport, and having the character of Vivand Morel, was very noteworthy. Mr. Woodgate was a good second.

Japanese were very finely shown. Mr. W. Higgs had a splendid box of twenty-four, but unfortunately they were densely packed and needed a larger board. W. H. Lincoln, Sunflower, Condor, Alberic Lunden, Mons. Carrière, and Violet Rose were splendid, the latter being par-

ticularly fine. Mr. Mease was second with somewhat smaller but still very fine flowers. Vivand Morel, J. S. Dibben, and G. C. Schwabe were amongst the best. Mr. Trinder, gardener to Sir H. Mildmay, Bart., Winchfield, was third, also with a very fine box. Mr. Felgate had a grand box of twelve, but they were sadly marred by overcrowding. W. W. Coles, Condor, Louis Boehmer, and W. H. Lincoln were very fine. Mr. Mileham, gardener to A. T. Miller, Esq., Leatherhead, was second, and Mr. Holden third, both having splendid blooms. Mr. Hopkins won with six, Miss Hartzhorn and Vivand Morel being splendid. Mr. Plowman, gardener to L. Laversmith, Esq., was second, and Mr. Quarterman third. Mr. Felgate won with six of one variety, Sunflower in grand condition representing him. Mr. Wyatt was second with Vivand Morel, very little inferior; and Mr. Carpenter third with a beautiful half dozen of Avalanche. Messrs. Griffin, Dorsett, and Wickins took the maiden prizes.

The minor sections were not too well represented. Mr. Carpenter, however, had a splendid box of twelve reflexed, and won easily. Mr. Mease also had a very good box; Mr. Felgate was third. Mr. Cawte won with twelve Anemones, a fairly good stand in which Mrs. Judge Benedict and J. Thorpe, Junior, were the best. Mr. Pitcher was second, and Mr. Woodgate third. The latter won with Pompons, Messrs. A. Nagle and Plowman being second and third. Messrs. Woodgate and Nagle were first and second with Anemone Pompons. Mr. Carpenter had a delightful box of singles, and was placed first, Mr. Woodgate being second. There were other classes for cut blooms.

The groups were, as usual, a great feature. Messrs. Puttock & Shepherd were first with a mixed group, and Mr. G. Mileham with Chrysanthemums. These were finely grown and carried excellent blooms. Mr. Pitcher was second, and also had a high class arrangement, although hardly so smooth as the other. Mr. J. Simmonds was third. It is not often better small groups are seen than these were. Mr. G. J. Cook and Mr. J. Reeves were second and third with mixed groups. The latter won with four trained Pompons, healthy and well bloomed, Mr. J. W. Reed being second, and Mr. Sallows third. Mr. Reed had the best trained Pompon, a fine plant of St. Michael. Mr. Reeves was first with three trained Japanese, all fine, well bloomed plants. The name of the winner of the first prize with six plants was out of sight, but Mr. Sallows was second. The table decorations were very attractive, and there was also a fine display of fruit, but for details of these classes space cannot, unfortunately, be found.

A first-class certificate was awarded to Mr. E. Molyneux for Mrs. Mitchell Chrysanthemum, of which three blooms were exhibited. It is a sport of Empress Eugénie that occurred and was fixed in New Zealand. They exactly resembled that pretty variety in size, shape, and character, but the colour is pale buff with a faint suffusion of purple. A first-class certificate was also awarded to Dr. George Walker for his clipper tube. The tubes containing blooms for exhibition are clipped by the socket or lining in the holes of the board, and the flowers can be raised without drawing the stems out of the water. Simple, cheap, and efficient.

NATIONAL CHRYSANTHEMUM SOCIETY.—NOVEMBER 8TH, 9TH, AND 10TH.

THE great autumn Exhibition of the National Chrysanthemum Society opened on Tuesday at the Royal Aquarium, continuing the two following days. As a whole the Show compared favourably with those of former years, although there appeared to be a falling off in some of the classes. The Japanese blooms were very fine, but the incurred varieties in many instances were badly finished, although in a few stands some grand flowers were staged. Groups were very fine, and the same may be said of the trained plants. In a bad light, however, it was impossible to see the true colours and beauty of the flowers.

OPEN CLASSES.

In class 1, open to Chrysanthemum and horticultural societies, for forty-eight blooms, half Japanese and half incurred, there were but two entries. The St. Neots Amateur and Cottage Horticultural Society, St. Neots, Hunts, secured the first prize; Mr. J. Myers, Knarsbrook, Hunts, and Mr. R. Petfield, Doddington Hall, Hunts, contributing the blooms. The flowers, although good, were not equal to those shown on previous occasions. The Japanese varieties were—Back row: Vivand Morel (good), E. Molyneux, F. Davis, E. W. Clarke, Stanstead White, Etoile de Lyon, G. Daniel, and Mons. Bernard. Middle row: Eynsford White, G. C. Schwabe (fine), Avalanche, Madame Audiguier, Mr. A. C. Carrière, Louis Boehmer (good), Madame M. Hoste, and Violet Rose. Front row: Sunflower, Excelsior, Beauty of Castle Hill, Jules Tussaunt, W. Lane, Val d'Andorre, Madame Lacroix, and E. Becket. The incurred were rather small and fairly well finished. The varieties were—Back row: John Lambert (good), Miss Wilson, Golden Empress of India (very good), Queen of England, John Salter, Empress of India, Violet Tomlin, and Miss Haggas. Middle row: Princess of Wales, Lord Alcester, Lord Wolseley, Mrs. R. King, Novelty, Mons. R. Bahuant, Jardin des Plantes, and Alfred Salter. Front row: A. Lyne, Princess Teck, Madame P. S. Blancart, Mdle. A. Hoste, Princess Beatrice, Mrs. Wm. Shipman, Refulgens, and Madame Darrier. The Havant Chrysanthemum Society secured the second prize for stands of excellent blooms, which were contributed by Messrs. J. Agate and C. Penfold.

Incurved.—The first prize including the Holmes Memorial challenge cup, for thirty-six incurred blooms was awarded to Messrs. W. & G. Drover, Fareham, who staged the following varieties.—Back row: Queen of England, Mons. R. Bahuant, Golden Empress of India, Alfred Salter, Robert Cannell, Lord Alcester, Guernsey Nugget, John Doughty,

Mrs. Robinson King, Lord Wolseley, and John Lambert. Middle row : Empress Eugénie, Jeanne d'Arc, Nil Desperandum, Mrs. Heale, Princess of Wales, John Salter, Princess of Teck, Mrs. W. Shipman, Prince Alfred, Lady Hardinge, Mrs. S. Coleman, and Violet Tomlin. Front row : Abbot's White, Lady Carey, Madame Darrier, Mme. F. Mistral, Novelty, Beauty, Miss M. A. Haggas, White Venus, Cherub, Mrs. N. Davis, Alfred Lyne, and Lady Dorothy. The second prize in this class was accorded to Mr. W. G. Ray, nurseryman, Teynham, Kent, whose flowers were very creditable ; the third prize going to Mr. Charles Gibson, gardener to J. Wormald, Esq., Morden Park, Mitcham, Surrey. Mr. Shoosmith, gardener to M. Hodgson, Esq., Shirley, Croydon, gained first prize for twenty-four incurved blooms, showing very good flowers. Back row : John Lambert, Violet Tomlin, Empress of India, Mons. R. Bahuant, Jeanne d'Arc, Lord Alcester, Lord Wolseley, and Queen of England. Middle row : Princess of Wales, Golden Empress, Madame Darrier, Alfred Salter, Mrs. Heale, Mrs. Coleman, Miss M. A. Haggas, and Princess of Teck. Front row : Lady Dorothy, Hero of Stoke Newington, Venus, Mr. Bunn, Mme. F. Mistral, Mr. Brunlees, and Refulgens. The second and third prizes went to Mr. Ritchings, gardener to Dr. Frankland, F.R.H.S., Reigate Hill ; and Mr. J. Myers, gardener to the Earl of Sandwich, Huntingdon, respectively. Mr. Arthur Ocock, gardener to Mrs. McIntosh, Havering Park, Romford, gained first prize for twelve incurved blooms, staging Lord Alcester, Violet Tomlin, Empress of India, Miss M. A. Haggas, Golden Eagle, Princess of Wales, Golden Empress (2), Lord Wolseley, Mrs. S. Coleman, White Venus, Golden Queen of England, and Jeanne d'Arc. Mr. Collins, gardener to J. W. Carlile, Esq., Ponsbourne Park, Hertford, was a very close second ; and Mr. Agate, nurseryman, Havant, was third. For six incurved blooms of one variety, Mr. Myers was first with very fine flowers of Empress of India ; Mr. Hewett, gardener to H. B. Mackeson, Esq., Hillside House, Hythe, second ; and Mr. Mackenzie, gardener to F. S. W. Cornwallis, Esq., Linton Park, Maidstone, third.

Japanese.—The flowers in the class for forty-eight Japanese were very fine, especially those staged by Mr. Herbert Fowler, Taunton, to whom the first prize was awarded. The blooms in this stand were brightly coloured, fresh, and well developed. The varieties shown were Vivand Morel (grand), Sunflower, Lord Brooke, Carew Underwood, Avalanche, Ruth Cleveland, Puritan, Mr. D. B. Crane, Mrs. Alpheus Hardy (good), Louis Bochmer (grand), Beauty of Castlewood, Mrs. J. S. Fogg, Ralph Brocklebank, Mons. Bernard, Eynsford White, Baronne de Prailly, Mdle. Marie Hoste, Mr. E. Becket (fine), Boule d'Or, Hamlet, Mons. Freeman, W. Tricker (excellent), W. H. Lincoln (splendid), Mr. H. B. Ironside, Colonel Smith (magnificent), Mrs. W. Herbert Fowler, Lady T. Lawrence, Mrs. J. Clarke (good), Japonaise, Aïla, W. W. Coles, Gloriosum, Mr. R. Williams, Stanstead White, Gloire du Rocher, Lilian Bird, Etoile de Lyon, Miss Anna Hartzhorn, Madame Baco, Mrs. E. D. Adams, Mrs. F. Jameson, Ethel Paule, E. Molyneux, Mrs. J. Laing, Florence Davis, Mrs. G. Bryceson, and Coronet. Mr. J. Myers was second, and Messrs. W. & G. Drover, Fareham, third with good blooms ; the fourth prize going to Mr. C. Gibson.

For twenty-four Japanese, distinct, Mr. Herbert W. Fowler, Taunton, was also an excellent first. He showed Vivand Morel, Florence Davis, E. Molyneux, Sunflower, Etoile de Lyon, Mrs. E. D. Adams, W. W. Coles, Stanstead White, Gloriosum, Mr. W. H. Neve, Mons. Bernard, Mrs. C. H. Wheeler, Puritan, Coronet, W. Tricker, Avalanche, Mrs. W. H. Fowler, Eynsford White, Madame Baco, Sarah Owen, Mrs. G. Bryceson, Miss A. Hartzhorn, Japonaise, and Madame J. Laing. Mr. Ritchings, gardener to Dr. Frankland, Reigate, was second. Mr. Ling, gardener to E. P. Oakshott, Esq., Orchard Dene, Ealing, third ; and Mr. Robt. Petfield, gardener to A. J. Thornhill, Esq., Diddington, Huntingdon, fourth.

Mr. Ocock, gardener to Mrs. McIntosh, Romford, was awarded first prize for twelve Japanese, distinct, which included Vivand Morel, Florence Davis, W. H. Lincoln, and Gloire du Rocher. Mr. Trinder, Dogmersfield Gardens, was second ; Mr. Harding, gardener to Mrs. Joad, Datchingham, Worthing, third ; and Mr. Geo. Carpenter, gardener to Major Collis Brown, Broad Oaks, Byfleet, fourth. For six Japanese blooms, white, one variety only, Mr. J. Hewitt, gardener to H. B. Mackeson, Esq., Hythe, was first, showing six grand blooms of Stanstead White. Mr. Cox, gardener to J. Trotter, Esq., Bickenden Grange, Hertford, was second, and Mr. Harding third. For six blooms of Japanese of any colour except white, Mr. J. Douglas, Great Gearies Gardens, Iford, was first with magnificent examples of Vivand Morel. Mr. Collins was second, and Mr. Howe, gardener to H. Tate, Esq., Streatham Common, third. Mr. R. Petfield was adjudged first prize for six incurved Japanese blooms. The second and third prizes were won by Mr. Howe and Mr. M. Harding.

Reflexed, Anemones, and Pompons.—The reflexed were not numerous, and the blooms in several stands might have been better. Mr. G. Carpenter, gardener to Major Collis Brown, was first for twelve blooms, showing among others Chevalier Domage, King of the Crimsons, Cloth of Gold, Dr. Sharp, and Cullingfordi, in good form. Mr. G. Myers was second ; and Mr. C. Brown, gardener to R. Henty, Esq., Langley House, Abbots Langley, third.

Mr. A. Ives, gardener to E. J. Jukes, Esq., Hadley Lodge, Barnet, had the best stand of twenty-four blooms of the large Anemone flowered section. The flowers were fresh and brightly coloured. Mr. Ives was also first for twelve large Anemone blooms ; Mr. Nutcott second, and Mr. C. White, Southsea, third. Mr. Ives was again adjudged first prize for twelve Japanese Anemone blooms. For twelve Anemone Pompons, distinct, the first prize was awarded to Mr. Myers. Mr. C. Brown

gained the first prize for twelve Pompons ; Mr. Myers being second, Mr. Agate, Havant, third.

AMATEURS' CLASSES.

The blooms in these were exceptionally good, though pressure on our space forbids details. Mr. H. G. Featherley, Bleak House, Gillingham, was a good first with twenty-four Japanese blooms, eighteen varieties, amongst which was a splendid flower of Vivand Morel. Mr. J. Herril, West Street, Havant, staged the best twelve incurved blooms, the flowers being neat and well finished. Mr. C. White, Southsea, was second. Mr. Horrill also secured first prize for six incurved blooms, the second award being taken by Dr. Walker, Lingfield Road, Wimbledon. Mr. Thos. Langley, Pinner Road, Watford, had the best twelve Japs, showing splendid blooms ; the second prize going to Mr. F. Hicks, Elstree, Herts. Mr. F. Durrant, New Road, Ware, had the best six Japanese blooms, Mr. J. Horrill following.

Mr. James Heath, gardener to M. Gurry, Esq., Abington Place, Newmarket, secured the leading award for twelve incurved varieties in this section, showing neat and well finished blooms. Mr. C. White was second, and Mr. J. Heath third. Mr. J. Little, Hylands, Romford, was first for six incurved blooms.

GROUPS AND TRAINED PLANTS.

Groups were very fine. For a group of any varieties, arranged in a space equal to 100 square feet, Mr. Norman Davis, Camberwell, secured the first prize, the second going to Messrs. Reid & Bornemann, Sydenham. In both groups the flowers were good and well developed. Mr. G. Stevens, St. John's Nursery, Putney, was third. The plants in this group were carrying splendid flowers.

For six trained standard specimens of large flowered varieties, Mr. D. Donald, gardener to G. G. Barclay, Esq., Leyton, was first, his plants being splendidly grown. Mr. Robert Clark, gardener to W. Griffiths, Esq., 44, Palace Road, Streatham, secured the premier award for trained specimens of the large flowered section. Mr. F. Gibbs, gardener to W. E. Frier, Esq., Elm House, Walthamstow, was second with well trained plants. Mr. W. Davey, gardener to C. Paine, Esq., Cedar House, Stamford Hill, was first for four standards, and third for the same number of bush plants, and second for one specimen. Mr. D. Donald also had the best six trained specimens of the large flowered section ; the second prize going to Mr. J. Brookes, gardener to W. Reynolds, Esq., J.P., Highgate. Mr. Gibbs was first with Pompons ; Mr. Davey second ; and Mr. W. Wesker, gardener to A. Haver, Esq., Tooting Beck Road, Upper Tooting.

MISCELLANEOUS.

Mr. R. Owen, Floral Nursery, Castle Hill, Maidenhead, sent a collection of new varieties not for competition, amongst them being some very fine blooms. Yellow Avalanche is a charming flower of medium size. Messrs. Pitcher & Manda, Hextable, also staged a grand collection of recently introduced and new varieties, as likewise did Mr. H. J. Jones, Ryecroft Nursery, Lewisham. The latter blooms were tastefully set up with Ferns in small pots. Mr. W. Wells, Earlswood Nurseries, showed a collection of miscellaneous varieties. The flowers were fresh and well developed.

Messrs. Cannell & Sons, Swanley, staged a magnificent group of Zonal Pelargoniums, including many of the latest varieties. They also showed a group of Chrysanthemums and a charming collection of Cyclamen in flower. Messrs. E. D. Shuttleworth & Co., of Fleet, Hants, and Peckham Rye, had a group of foliage plants. Messrs. W. Edwards and Son, Sherwood, Nottingham, sent a fine group of Ferns in pretty decorative pots, called the New Edwardiane, a combination of cork and pot, producing, when filled with Ferns, a most charming effect. Messrs. B. S. Williams & Son, Victoria Nurseries, Upper Holloway, staged a group of foliage and flowering plants.

For a table of bouquets, wreaths, and sprays, Mr. J. R. Chard, Brunswick Nursery, Stoke Newington, was first. Messrs. Perkins and Son, nurserymen, Coventry, second, and Mr. H. O. Garford, florist, Stoke Newington, third. Mr. F. W. Seale, Vine Nurseries, Sevenoaks, was adjudged first prize for three vases or epergnes. Mrs. W. Mole, High Street, Hemel Hempstead, was second, and Mr. Potter, gardener to Sir M. W. Collet, Bart., St. Clere, Kemsing, Sevenoaks, was third. For two bouquets of Chrysanthemums Mr. Potter, Kemsing, Sevenoaks, was first ; Mr. Chadwick, 8, Dorset Gardens, Brighton, second ; and Mr. Ings, gardener to Sir J. Spencer Wells, Bart., Hampstead, third.

For the special prizes offered by various firms Mr. W. H. Fowler, Taunton, was awarded first for six blooms in not less than four distinct varieties. The first prize for three blooms of the best new Japanese was awarded to Mr. W. Seward, The Firs, Hanwell, who staged magnificent blooms of John Shrimpton. Mr. W. G. Gilbert, gardener to B. Le Neve-Foster, Esq., J.P., Sennon Hall, Guist, Norfolk, was first for three new varieties ; and for three blooms each of any new seedling Chrysanthemums Mr. H. Shoosmith, gardener to M. Hodgson, Esq., Croydon, was awarded third prize, showing Professor Wittmack and Dr. Kawallek.

New varieties were numerous. W. Seward, Esq., The Firs, Hanwell, sent blooms of several new varieties, amongst them being C. Thompson, a crimson Jap with silvery reverse, and Princess Victoria, white reflexed Jap ; first-class certificates were awarded these. Mr. C. Blick, The Warrens, Hayes Common, sent blooms of an incurved Jap named Mrs. A. H. Glasham, a lemon coloured variety, so far as could be seen in a very bad light. Messrs. J. R. Pearson & Sons, Chilwell, had Mermaid, a splendid white incurved Jap, and Edwin Lindsdal, a reflexed Jap of a promising character. Messrs. Carter & Co. sent White Pearl, a charming decorative white, and Rosy Morn, the latter being adjudged a first-

class certificate. Mr. W. G. Godfrey had a stand of Beauty of Exmouth and Duchess of Devonshire. Mr. H. J. Jones secured a first-class certificate for Mr. Chas. Blick, a charming pale yellow Japanese. Mr. R. Owen also gained certificates for Robert Petfield and Lucy Kendal, both promising incurred varieties. Several others were also shown, though these must be referred to next week.

Fruit was well represented. Messrs. Cutbush & Sons, Highgate staged a collection of Apples, as also did Messrs. J. Cheal & Sons and Messrs. J. Laing & Sons. Mr. J. Edmond, Bestwood Lodge, Notts; Mr. A. Ocock, Havering Park, Romford; and Mr. W. Allan, Gunton Park, Norwich, were among the prizewinners in the classes for black Grapes; and white Grapes were best shown by Mr. W. Harman, gardener to the Earl of Denbigh, Newnham Paddock, Lutterworth. Messrs. Rivers and Sons, Sawbridgeworth, also sent a collection of well-coloured Apples.

Vegetables were also very fine, especially those in competition for the prizes offered by Messrs. Sutton & Sons. Mr. J. Gibson, The Oaks, Carshaiton, was first with a grand collection; Mr. R. Lye, Sydmonton Court, Newbury, second; and Mr. C. Waite, Glenhurst, Esher, third. Mr. Waite was first, however, for Messrs. Webb & Sons' prize; Mr. W. Pope, Highclere Castle, second; and Mr. R. Lye third.

FRUIT FORCING.

Vines.—*Early Forced Vines in Pots.*—There must not be any further delay in getting the house ready and placing the Vines in position. To increase the weight and quality of the Grapes the apertures in the pots should be widened and some turfy loam placed within easy reach of the roots. This is best effected by erecting pedestals of loose bricks for the pots to stand on, and then building up against these pedestals turfy loam, in alternate layers with lime rubbish, from the bottom to a little above the side apertures in the pots. By introducing Oak or Beech leaves into the pit they will supply a genial warmth and moisture in the early stages, and rich stimulating food towards the close. The heat about the pots must not, however, exceed 65° at the start, the leaves being added to and raised to the rims of the pots so as to raise the temperature to 70° or 75° by the time the Vines are in leaf. Although it is necessary to have the soil moderately moist, an excess of water is undesirable in the early stages, as it is injurious to the fibres; merely keep the soil moist until the Vines start into leaf, increasing the supply as the foliage unfolds. The canes should be placed in a horizontal position to insure the buds breaking evenly, damping the Vines and house two or three times a day, and maintaining a temperature of 55°, and 65° on fine days.

Early Planted-out Vines.—When young and vigorous Vines have to be started for the first time to afford ripe Grapes at the end of April or early in May, the house must be closed by the middle of the month, for they do not, as a rule, "break" so quickly as Vines that have been forced for a number of years. The Vines will need to be brought into a horizontal position and be well syringed with tepid water, or about 10° warmer than the house, two or three times a day. The temperature of the house may average 50° at night, 55° by day, and 65° on bright days. Older Vines, or those that have previously been forced, need not be started until the beginning of December.

Houses Cleared of Grapes.—When the Vines are leafless and the Grapes cut attend to the pruning without delay, for nothing contributes more to a good break than an early and complete period of rest. Vines in good condition, having stout short-jointed wood thoroughly ripened, may safely be pruned to a couple of buds. The latter, however, are not always sufficiently developed at the base of the annual growths to give as large bunches as desired, and in that case the laterals may be left a little longer, say one or two more buds. It is necessary that a plump, round (not large and flat), well-developed bud on stout, hard, thoroughly ripe wood be selected for pruning to, as such usually produces a close compact bunch of well-set berries. Well-ripened wood is paramount for the production of Grapes, but the basal buds are often small, and this arises from a number of causes; sometimes from overcropping, at others through overcrowding, frequently from excessive vigour, and oftentimes from weakness. The result is small bunches, or none at all, when hard and fast lines of pruning are practised. Pruners must therefore exercise judgment, avoiding pointed buds, as they are not usually productive of bunches. Wash the house thoroughly, cleansing the glass and woodwork. Remove all the loose bark on the Vines, but avoid injuring the rods by needless peeling and scraping. Wash the Vines with tepid soapy water, 3 ozs. of softsoap to a gallon of water, using a brush effectively, yet with care and judgment, so as to reach and dislodge any hibernating pests. After an efficient washing follow with an insecticide. Those advertised answer well if care is taken to follow the instructions. Remove the remains of the mulching, also the surface material down to the roots, especially near the collar, and supply a top-dressing of fresh turfy loam chopped moderately small, and to a barrowload (about 3 bushels) add a quart each of steamed bonemeal and soot, and half a peck of wood ashes, incorporating thoroughly. Do not employ more of the mixture than suffices to cover the roots a couple

of inches. This will encourage surface roots, and when these are active and the Vines in full leaf they can be fed to any extent by top-dressings and liquid applications. Where the houses must be used for plants they should be kept cool, not exceeding 40° to 45°, ventilating freely above that temperature.

Houses of Thin-skinned Grapes.—The soil and atmosphere have been saturated by the recent heavy and continued falls of rain, and these have caused Grapes, particularly Black Hamburgs, which have been ripe since August, to damp considerably in spite of free ventilation and a gentle warmth in the hot-water pipes. The Vines that ripened their crops in September are still in foliage, and will bear more moisture at the roots and in the atmosphere than those that have had the Grapes ripe since August; indeed, a moderate atmospheric moisture is necessary to prevent undue evaporation and the shrinking of the Grapes. A slight warmth in the hot-water pipes will be required almost constantly to maintain an equable temperature, but this must not be too high, or it will so dry the atmosphere as to cause the Grapes to shrivel prematurely. A temperature of 40° to 45° at night and 50° by day will be sufficient, ventilating freely and early in bright weather, so as to prevent moisture being condensed on the berries. Outside borders should be covered with tarpaulin or lights to throw off heavy rains, and if inside borders are given a covering of dry straw it will prevent its cracking and keep down moisture considerably, but the point is ventilation and a drip-proof roof.

Late Grapes not Finishing Well.—This usually arises from three primary causes—namely, starting the Vines too late, and not accelerating thorough growth during the spring and early summer months, so as to give the Grapes the full benefit of the summer sun to swell and ripen. Overcropping, too, not only prejudices the current crop, but militates considerably against the succeeding year's bearing of the Vines. A bad condition of the roots is, however, the most disastrous of all, for improper food is attended with many evils, and these hinder the perfection of the crop. If the defect is due to overcropping, relief should be sought by cutting a portion of the crop at the earliest convenience, and though nothing will be gained by pushing the fire now the temperature should be maintained at 60° to 65°, with 10° to 15° advance from sun heat, so as to secure the thorough ripening of the wood, admitting air freely when the weather is favourable, and leaving a little on constantly. Where the cause can be traced to imperfect drainage or bad borders no time should be lost after the wood becomes sufficiently ripened, or when the leaves give indication of falling, in getting out the old soil, rectifying the drainage, and relaying the roots in fresh compost.

THE KITCHEN GARDEN.

Kidney Beans.—These must have ample room and plenty of heat. If those in heated pits are kept staked upright and watered somewhat sparingly, especially if there is any old heating material underneath, several good gatherings should be available during November. If there are any bottom heat pipes let the Beans have the benefit of these; but bottom heat can be dispensed if the top heat never falls much below 60°. December supplies are best had from pot plants in a light forcing house, the first batch being already growing strongly. More new seed of either Osborne's Forcing, Sion House, or Ne Plus Ultra should now be sown, giving the preference to either 8-inch or 9-inch pots. Fill the pots to within 2 inches of the top of the rims with moderately good loamy soil, and sow about nine seeds in each, cover with another inch of soil, filling the pots up in the first instance being a better plan than allowing space for top-dressings later on. The seed germinates most quickly when the pots are set direct on hot-water pipes, taking care to shift the plants to lighter quarters before they become badly drawn. Six plants are enough to leave in each pot, these being duly supported with Birch spray or stakes and strips of matting. Not less than three dozen pots should constitute a batch, and the plants must be pushed along sharply to have them in full bearing at Christmas.

Seakale.—The Lily White form of Seakale is a decided improvement on the old variety in all respects other than hardiness. It is liable to be badly injured by severe frosts, large numbers of crowns being destroyed last winter. Being forewarned there ought to be no risks run. All the leaves can now be cleared away, and a few score or hundred crowns should be lifted and stored in moist soil ready for forcing, where they can be protected from severe frosts. The rest of the Lily White should then be heavily moulded over, or else covered with strawy litter. It is also advisable to take similar precautions in the case of the hardier form, as then roots can be lifted for forcing purposes whenever required. Forcing Seakale in the open ground with the aid of pots and manure is a very slow process, though it answers well if properly carried out. Not less than six pots should be covered at one time, and enough manure and leaves placed over them to get up a good heat, a close look-out being kept against injurious overheating. It is the old roots or clumps that are forced in this way, strong one-year-old or two-year-old roots being lifted and forced in either Mushroom houses or pits. They may have their thongs roughly shortened, the best of what are cut away being saved and stored in sand or soil for propagating purposes, and the trimmed roots be then packed together somewhat closely in boxes, pots, or beds of fairly rich soil. If either boxes or pots are used, and these set on or near to hot-water pipes in forcing houses, care must be taken to keep the soil uniformly moist, and also to exclude all light from the crowns. Seakale grows less slowly in Mushroom houses, but being in the dark the blanching is most perfect. In a forcing house or plant stove, the pots being kept either on or very close to the hot-water pipes, it ought to be possible to cut Seakale in about three weeks.

THE BEE-KEEPER.

APIARIAN NOTES.

PRESENTATION TO TWO OLD BEE-KEEPERS.

AT Larkhall, on the evening of the 29th ult., about thirty members of the Larkhall Bee Society and a deputation from the Stonehouse Society met to do honour to two of their oldest members—viz., Mr. James Wilson, now in his ninety-second year, and for upwards of fifty years clerk to that more than a century old Society; and Mr. Richard Finlayson, President for upwards of forty years. The Chairman (Mr. John Nicol), who presented the guests of the evening with silver-mounted walking sticks, in his remarks said that knowledge with truthfulness and reliability were not only personal honours, but of national worth, more valuable than gold. Both gentlemen made appropriate replies, although unaware till the time of presentation what was in store for them.

WINTERING BEES.

Forty years ago I discovered that there was no necessity for keeping twin hives, as a small nucleus of bees withstood our then severest winters. At that time I had commenced to make frame hives, and saw the advantage that would be gained by introducing frames to good hives, abandoning at the same time the custom of dividing a Stewarton hive into two or three, as the case allowed, and distributing the divisions amongst as many stocks. This early idea entirely obviates the necessity of having large cumbersome hives as recommended by some modern bee-keepers who seem to have a strong desire to claim that if the idea is not new "it has new features."

EGG LAYING.

If the maximum number of bees from two queens be allowed in one hive, it becomes at times unmanageable. It is the great desideratum in bee-keeping to have the largest number of bees possible at the proper time, with hives sufficiently large for the greatest laying of any queen, so that she will never be crowded out; yet, not so large as to make the hive unmanageable in transit, nor the bees to become pests for robbing and stinging in the apiary, or to be a positive loss to the bee-keeper in bad seasons. The weakest hives this year are the heaviest in honey.—A LANARKSHIRE BEE-KEEPER.

TRADE CATALOGUES RECEIVED.

R. H. Vertegans & Co., The Old Nurseries, Chad Valley, Birmingham.
—Hardy, Herbaceous, Alpine, and other Rock Plants, &c.
E. D. Shuttleworth & Co., Albert Nurseries, Peckham Rye, London, S.E.—Fruit Trees, Roses, and Miscellaneous Plants.

*All correspondence should be directed either to "THE EDITOR" or to "THE PUBLISHER." Letters addressed to Dr. Hogg or members of the staff often remain unopened unavoidably. We request that no one will write privately to any of our correspondents, as doing so subjects them to unjustifiable trouble and expense.

Correspondents should not mix up on the same sheet questions relating to Gardening and those on Bee subjects, and should never send more than two or three questions at once. All articles intended for insertion should be written on one side of the paper only. We cannot reply to questions through the post, and we do not undertake to return rejected communications.

Address (H. M.).—The *Eastern Morning News*; also the *Hull Daily News* and *Hull Daily Mail* are good mediums for your purpose.

Books (C. O.).—We do not know of such a work as you appear to require. There are several illustrations in Mr. Cannell's *Floral Guide*.

Tenant of Garden (A. J. T.).—We are obliged by your letter, but we had previously been made acquainted with the circumstances of the case by the gardener you name.

Mrs. Naish and Mrs. G. Rundle Chrysanthemums (R. F.).—If these varieties are not identical they are too much alike to be included in a stand of four varieties, as the judges might not admit their distinctness, and there is then a risk of disqualification.

Artificial Manure for Autumn-sown Onions (W. B.).—There is, perhaps, no better manure for Onions than soot, and it may be applied in February, or as soon afterwards as the weather permits, at the rate of a peck per rod, or 40 bushels per acre.

Chrysanthemum Show (S. K.).—We presume if the officials desired to give wide publicity to the Show they would have done so by advertisement, as is done by most of the leading Societies. The terms of your note bring it strictly within the category of advertisements.

Worms in Soil for Bowling Green (A. H. L.).—As the soil is good and the subsoil stiff clay it would be best to apply a dressing of quicklime at the rate of half a bushel per rod, and point it in before laying the turf. If the lime is fresh burned, placed in small convenient heaps, covered with a little soil, and spread evenly over the ground, it would destroy the worms and greatly improve the soil if mixed with it. Avoid salt, as it tends to make the soil moist, and is not useful in heavy land.

Tomato House Arrangements (J. A.).—If you decide to have Tomato plants on the back wall instead of Peach trees, then it would be cheapest and best to have a three-quarter span-roof structure. In that case the arrangement of the Tomato plants in front must be crossway of the house, as advised in reply to your inquiries last week, so as to admit plenty of light to the plants against the wall. A house for growing Tomatoes in summer is best with the ends of the span facing north and south, but we have had good results in a span-roofed structure running east and west both early and late, as the plants on the south side do better and come into bearing sooner than those on the north side.

Mushroom Bed Unsatisfactory (Kelsey).—The "fungus gathered from a Mushroom bed" has not been forwarded, at least we find no evidence of fungus amongst the contents of the small box likely to injure Mushroom spawn, and of that there is no trace. Instead of the fungus gathered from the Mushroom bed, we find some swollen fusiform roots, probably of a small creeping herbaceous plant or weed, which have been introduced to the Mushroom bed in the maiden loam, and from which they have been taken, for they are not outgrowths of a fungus. The cause and remedy must be sought for elsewhere, and it probably proceeds from some error in the materials, their preparation, spawning or management of the beds, or it may arise from the use of old and indifferent spawn.

Questions not Answered (Lawrence & Son).—We have very great pleasure in giving the best information at our command in replies to correspondents, and we are gratified by knowing that such information has been helpful to others than those who have been the means of eliciting it. It seems you have found the advice which we have given to others has been such as you required. We are pleased to hear this, but sorry to learn the two letters you have sent direct have not received attention. The reason of this is that from some unexplainable cause the letters did not reach the hands of the Editor. Are you sure they were properly addressed? Numbers are not that after some delay find their way to this office, and no doubt several go astray. We are obliged by your good wishes, and this reply proves our willingness to attend to your letters.

Artificial Manure for Winter Lettuces (W. B.).—These do not require to be greatly stimulated, as it only tends to make them more susceptible of injury from frost, and they are usually grown on land in good heart or manured with stable refuse of a gradual decomposing nature, which, from the humus, aids the plants to maintain a steady progressive growth and form fine heads of succulent leaves. Guano would be one of the best "artificial," and it may be applied early in spring, when the weather becomes favourable and the plants are beginning to grow, at the rate of 2 lbs. per rod or 3 cwt. per acre; when they are fairly moving you may supplement the guano with nitrate of soda at the rate of 1 lb. per rod, or 1½ cwt. per acre. Both the guano and nitrate of soda must be kept off the plants, as if it gets into the hearts they may be seriously damaged.

Expelling Worms from a Lawn (C. B.).—The entire eradication of worms on lawns is impossible without rendering the latter worthless, and it is best to fight them occasionally. We prefer mixtures that act as manure as well as expel the worms. If the soil is light apply a dressing of salt and soot: mix 6 bushels of salt and 12 bushels of soot well together, and scatter evenly after sweeping the lawn with a birch broom, so as to disperse the wormcasts, choosing a moist day for the operation. This banishes the worms and has a beneficial effect on the grass. The quantity named is for one acre, but it may be used at the rate of half peck per rod. If the soil is heavy it is better to use lime and soot, say air-slaked lime 30 bushels, soot 10 bushels, mix well, and apply evenly to an acre of lawn, or 1 peck per rod. This mixture kills moss and is useful against grubs as well as worms. The present is a good time to apply the mixture, or in February, or as soon after as the weather permits.

Burying Potted Bulbs (F. J.).—You ask "if it is absolutely necessary that potted bulbs should be plunged for five or six weeks, and if so if leaves will do as well as ashes for the purpose." Our answer to the first question is that it depends on the skill of the cultivator, and especially on the judgment he is able to exercise in watering. We have

grown Hyacinths and other bulbous plants to our satisfaction without plunging the pots, but have also found that burying them till roots form and crowns start the more easy and reliable method. As a covering medium we prefer cocoa-nut fibre refuse, which is clean, cheap, and useful in all gardens. We have also found sweet ashes satisfactory, and ashes not sweet the reverse. Comparative fresh leaves containing slugs did not answer because the molluscs nibbled the tender growth from the bulbs, but partially decayed leaves free from slugs were quite satisfactory. Damp plunging and covering material keeps the soil uniformly moist without watering, and therefore in the best condition for inciting free root action, and consequently bold healthy crowns.

Bedding Calceolarias (*J. W., No. 2*).—If the growths of your yellow Calceolarias are quite uninjured by frost we should choose the shortest jointed for cuttings and insert them at once. They require no heat. They will root slowly but surely in sandy soil under a handlight or in a close cold frame, covered to exclude severe frost. Strong sappy young shoots are not suitable, but only those which are sturdy and firm. They may be about 3 inches long, the lower pair of leaves removed, and some of those retained half shortened, thus reducing the evaporating surface, though if they can be kept fresh without shortening the cuttings will root just as well, if not sooner. Spring-struck cuttings do not, as a rule, make robust plants. Old plants taken up, potted and well watered may be wintered in a protected frame for affording cuttings if needed, or giving a bright display of flowers early in the year.

Poinsettia Leaves Falling (*A. S. T.*).—You should have described the treatment to which the plants that have unfortunately "lost all their leaves" were subjected. Defoliation is caused by neglect or errors in watering, or a too low temperature. When the roots cease moving through cold, or any other cause, the leaves commence falling, and we have very little doubt that most of the roots of your plants are dead. We have known them destroyed by too strong applications of manure. It should be remembered that Poinsettias are tropical plants, and must have stove heat in winter, though most of the leaves of well-grown plants are retained in warm conservatories, not cold greenhouses. You are too reticent in the statement of your case to enable us to indicate the precise reason of the plants being in their present condition, though we may have put you on the track for tracing the source of the evil.

The Heaviest Bunch of Grapes (*J. W. Penshore*).—The heaviest bunch of Grapes that we have seen weighed was an unthinned cluster of Calabrian Raisin at the Royal Caledonian Society's Show at Edinburgh in 1875. It was grown by Mr. J. Currer, Eskbank, and turned the scale at 26 lbs. 4 ozs. That, so far as we know, is the greatest authenticated bunch on record. The late Mr. James Dickson of Arkleton had a much larger bunch at the same Show, but it only weighed 25 lbs. 15 ozs. The berries had been thinned, and were very fine. This bunch was 2 feet 3 inches in width across the shoulders, and the same in length, and the circumference, following the contour of the shoulder to the base of each, was 8 feet. Had the whole of the berries been left on, the cluster would have been decidedly heavier. The largest bunch of black Grapes known to us was a splendid example of Gros Guillaume (often misnamed Barba-rossa) grown by the late Mr. Roberts at Charleville, the weight being 23 lbs. 5 ozs. The three bunches mentioned are illustrated in Mr. Barron's work on the Vine. You should procure it.

Soil for Aucubas (*C. B.*).—In the environs of Bradford, Yorkshire, we found Aucubas did not succeed in heavy soil, but when that was made open by an admixture of ashes and road scrapings they did well. They, however, do best in naturally friable loam well drained. If grown in pots or in a specially prepared soil, the compost should consist of turfy, rather sandy, yellow loam, with plenty of drainage to carry off superfluous water. It would be a capital plan to sponge the full grown leaves with soapy water, say 2 ozs. of softsoap to a gallon of water, which, by freeing them of the sooty deposits, would render the foliage much more attractive and the plants more healthy, but it could only be practised on the score of expense on a small scale. We have found it an excellent practice to syringe evergreen town shrubs with water in the evenings of hot days, as it keeps the foliage free from dust and sooty deposits. It also enables the leaves to attain greater development, but it is during foggy weather in autumn and winter that the soot accumulates fastest and thickest, when syringing would do more harm than good. There is no objection to the sponging. It is solely a question of expense, and as we have seen it carried out, we can vouch for its excellency to the plants and the brightness it imparts to them. The best way is to syringe the plants with a tepid (90°) soapy solution (2 ozs. softsoap to a gallon of water), and let this act on the sooty deposits for a short time, but whilst still damp sponge the leaves, and then the work is done in about half the time and very much better.

Names of Fruits.—*Notice.*—Special attention is directed to the following decision, the object of which is to discourage the growth of inferior and promote the culture of superior varieties. In consequence of the large number of worthless Apples and Pears sent to this office to be named, it has been decided to name only specimens and varieties of approved merit, and to reject the inferior, which are not worth sending or growing. The names and addresses of senders of fruit to be named must in all cases be enclosed with the specimens, whether letters referring to the fruit are sent by post or not. The names are not necessarily required for publication, initials sufficing for that. Only six specimens can be named at once, and any beyond that number cannot

be preserved. (*T. Stephens*).—1, Golden Spire; 2, Lane's Prince Albert; 3, Golden Knob; 4, Comte de Flandres. (*R. McKellar*).—The Pear is Thompson's, and the Apple Carlisle Codlin. (*Thornhays*).—2, Striped Beefing; 4, Tower of Glamis; 5, Northern Greening; 6, Napoleon. (*T. H.*).—1, Catshead; 2, Striped Beefing; 3, Scarlet Pearmain. (*J. E. K.*).—B, General Todleben; C, not known, not specially good; D, Northern Greening; F, Royal Russet. The Pear is Uvedale's St. Germain. (*Herbert*).—1, Beurré Superfin; 3, Passe Colmar; 4, Josephine de Malines; 5, Winter Nelis; 6, Perhaps Easter Beurré. (*G. A.*).—1, Round Winter Nonesuch; 2, King of the Pippins; 3, Hawthornden; 4, Catshead; 5, Greenup's Pippin; 6, Yorkshire Greening. Some of these Apples are not characteristic specimens, and the names are, therefore, only approximate. (*F. J. Gray*).—1, Fondante d'Automne; 2, Swan's Egg; 3, Beurré Lefèvre; 4, Beurré Diel; 5, Wyken Pippin; 6, Rosemary Russet.

Names of Plants.—We only undertake to name species of plants, not varieties that have originated from seed and termed florists' flowers. Flowering specimens are necessary of flowering plants, and Fern fronds should bear spores. Specimens should arrive in a fresh state in firm boxes. Slightly damp moss, soft green grass or leaves form the best packing, dry wool the worst. Not more than six specimens can be named at once, and the numbers should be visible without untying the ligatures, it being often difficult to separate them when the paper is damp. (*J. J.*).—*Berberis vulgaris*.

COVENT GARDEN MARKET.—NOVEMBER 9TH.

Market quiet, with supplies more than equal to demand.

FRUIT.

LANDLORD AND TENANT.

WHAT are the duties of landlords and tenant farmers, and how they are generally understood and applied, is a question of

such importance that it is much discussed, opinions being freely forthcoming which are frequently the reverse of flattering to either class. That both have special and novel duties arising out of the changing conditions of land tenure, of the production and sale of farm produce, and, above all things, of foreign competition, there can be no doubt, and the sooner the nature of such duties and the best means of discharging them are fully understood, the sooner shall we see prosperity restored to agriculture. To continue striving to farm upon old lines in the face of the altered condition of things is utter folly; where it is done the struggle for bare subsistence, after "making the rent," is so severe that it is of itself enough to make those engaged in it consider if other and better means are not available. It is surely not for want of advice or discussion that farmers generally cannot do better; the difficulty seems to be to decide upon a definite course wherein improvement is clearly possible, and then to act with decision. With straitened means and falling prices farmers dare not venture upon speculative efforts to improve their condition. They must turn to something where fair profits have been proved to be possible, and so in changing reduce the risk of loss to a minimum.

We have repeatedly urged upon them the importance of co-operation in such a manner that it should not affect any individual at the expense of others. When a body of men combine together character always tells, the best men invariably come to the front; therefore any co-operative scheme must be arranged upon such a footing that there shall be no hard measure dealt out to the inferior men. In dairy co-operation, to which we have several times called attention, everything is perfectly fair, and the entire scheme is within ordinary comprehension. To begin with, the shares of a co-operative company are £1 per cow, not paid all at once, but in response to calls of two or three shillings, as money is required for preliminary expenses, such as buildings, machinery, and general plant. The milk of each shareholder is tested periodically for quality, and is paid for accordingly, so that individually the shareholders are treated with perfect fairness, both for produce supplied and also in sharing the profits.

In an able paper read recently before the Chester Farmers' Club, Mr. C. W. Dutton placed especial stress upon the necessity for improved dairy accommodation. He said—"I am afraid bad dairies have more to do with bad flavoured cheese than anything else, the loss upon which to farmers is enormous, for it is principally the indifferent flavoured cheese that feels the foreign competition. It is of no use the dairy institutes teaching how to make finest cheese with every convenience if the scholar is to go home and try to make the same quality without the same appliances, for he will utterly fail." Upon the face of things it would appear futile to ask landlords for improved dairies, but it must not be forgotten that the rent of dairy farms has not been reduced in anything like the same ratio as that of corn farms, and tenants have fair reason to ask and expect to have such help from landlords. It is in districts where aid of this sort is not forthcoming that co-operative factories both for cheese and butter would prove such a boon, and their establishment in considerable numbers is highly desirable. Of course there is a limit to such extension of dairy farming, and wherever mixed farming is possible it should be fully carried out. Our mistake in the past has been in extremes; let us apply the lesson now, and wherever it is possible so bring our land under different crops, or a system of management which competition in any particular thing cannot affect seriously. Farming is now a stern struggle with adversity, and it is only the best practice that can answer. Men are wont to talk of luck and chance; depend upon it none of these things have anything to do with ordinary success. No sensible man is misled by a single fortunate transaction in business; that is altogether apart from the general question.

Again, we say to tenant farmers, Keep well within the scope of your means; avoid extremes; keep a strict guard upon expenditure; do what you undertake thoroughly both in land cultivation and live stock management, and above all things let your eye and hand be felt everywhere upon the farm. The man who sets himself earnestly to struggle with hard times, who will not give in, who sees nor feels no shame, no degradation in using every faculty both of mind and body to support himself and his family, will be on the alert to seize every fair means to attain his end, will have no silly prejudice against change and improvement, and he will command the respect and admiration of every good man and true.

WORK ON THE HOME FARM.

Among other work of improvement the re-arrangement of holdings and the division of very large meadows is now being done. Such enclosures, if of any size, ranging from six to a dozen acres, are far more useful than very large meadows. Live stock often require a decided change; grazing, too, is altogether better managed when enclosures are of moderate size. In this matter, while paying due heed to tenants' requests, general estate improvement is kept fully in view, mere fanciful changes being quietly ignored. We have several farms on both sides of a wide valley; two of them run from the top of the slopes right down to the stream which runs through the valley. These are the most satisfactory farms, and we are gradually bringing others into the same form. The main difficulty in this matter is a central position for each house and homestead, and suitable cattle shelter upon outlying land. Tenants have been allowed to hire so many detached meadows that at length complaints have been made of the difficulty of overlooking them, and a change is being effected in the direction of compactness of holdings. This is not so difficult as might appear, for unfortunately there is not a Michaelmas without some change or warning of change among tenants, and the landlord who really cares for his tenants and feels an interest in his property is frequently in earnest consultation with his agent as to the best means of meeting the changed conditions of the ownership and management of landed property.

Water is always an important factor in meadow divisions; this should be remembered in draining land, all superfluous water being stored in ponds or pools at the most convenient points, and overflow conducted to another meadow if possible. A long wide gentle slope into such pools for cattle to drink answers best, and it should be hardened with gravel, so as to prevent any accumulation of mud, or difficulty of approach in winter. This is just one of those trifling matters of detail worthy of attention at first, so that a really sound permanent job may be made of it, and subsequent trouble avoided. It is one of the things which go to render a farm desirable in the eyes of a prospective tenant, who is very keen to note wants and failings in his inspection of vacant farms, and this is precisely one of the things he must have.

OUR LETTER BOX.

Kerry Cattle (Hoping).—We know of no pamphlet devoted to these useful little animals. If you have access to a public library you may find illustrations and particulars of them in Stephens' "Book of the Farm," or other modern works in which farm stock are treated.

REMARKS.

- 30th.—Sunny throughout; solar halo in morning; steady heavy rain from 8.30 P.M. to 9.30 A.M. on 31st.
 31st.—Continuous rain till 9 A.M.; overcast and damp all day.
 1st.—Fine, but sunless day; bright moonlight night.
 2nd.—Dense fog till about 11 A.M. clearing slowly, and occasional sun from 1 P.M. to 3 P.M., then spots of rain and wet from 6.30 P.M. to 9 P.M.
 3rd.—Bright sunshine almost throughout.
 4th.—Overcast early, a little sunshine between 10 A.M. and noon; then cloudy again and wet after 3.30 P.M.
 5th.—Overcast morning, sunny afternoon; very wet from 7.30 P.M. to 11 P.M.
 A warmer and very wet week.—G. J. SYMONS.

WHETHER or not I am justified in using the above heading will perhaps be considered a moot point. Any way, my ideas on the subject will be perfectly original, and if rather late in being published, have yet been "on my mind" for many weeks past. What I venture to term a new industry is simply bottling, not canning Pears. At several public dinners it has fallen to my lot to attend during the past few months I have noticed that stewed Pears figured largely among the "sweets," and, what was equally apparent, they disappeared with remarkable celerity. They were fully appreciated by a great majority of the guests, and in all probability if double the quantity had been placed on the table there would have been very few left. As might reasonably be expected of one who is always on the alert for something fresh that is worth knowing, I took the first opportunity of congratulating the host upon the excellence of the stewed Pears, and was told "under the rose" that they were simply canned Pears. Those Pears actually came all the way from California, and were brought into a neighbourhood where large quantities of really good Pears were either spoilt or sold at very low prices during the season of 1891. The same thing has occurred, or is occurring, in various other fruit-growing districts, or at any rate where fruit could be well and extensively grown, and yet to all appearance our farmers and fruit growers are quite helpless in the matter. Nor do I think many of either class have sufficient enterprise to compete against their more go-ahead competitors over the sea. Yet something must be done. So much tree planting has been carried out in various parts of the country that the time is not far distant when great gluts of fruit will occur, and it is anticipation of this that I would urge the necessity for taking active steps in experimenting and preparing for future undertakings.

That there is a great and increasing demand for canned Pears there is no disputing, and it is equally certain that preserving in that way is a very profitable industry. The best brands of Californian Pears are in square tins closely soldered down, and holding about 3 lbs. of fruit. These the Italian warehousemen and grocers have delivered to them in fairly large quantities at the rate of 15s. per dozen. The second quality, and which are only very slightly inferior to the best, are in 2½ lbs. tins, and supplied wholesale at about 11s. per dozen. The latter are retailed at 1s. 3d. each, more or less. On opening one lately I found it held about six Pears duly pared and cored, so that the consumer pays somewhat dearly for the luxury of having the fruit ready stewed. The syrup was rather thin and sweet, and of course added considerably to the weight. Evidently the fruit is sound, properly stewed and well secured in the tins. Only too evident also is the fact that the Americans have the advantage of us in climatal conditions, bad years being the exception to the rule, while the great shipping companies can afford, or do afford, to bring all such commodities into this country at very low rates. What we have, therefore, to do is to beat them with their own weapons, or rather improve on what they do, or are ever likely to do. In their case the Pears must be canned, and among our countrymen there are many who cannot be knowingly persuaded to eat anything that has been kept in cans or tins of any kind. With bottled fruit there is no risk of lead or any other poisoning, and it is in bottles that stewed Pears ought to be placed and sold. Bottles will certainly

be less handy for packing, storing, transit, and such like, but their other advantages will tell heavily in their favour eventually. Whether they are cheaper than tins or not I am unable to say, but they are decidedly the best for use among fruit growers on a small scale, soldering down the lids of tins being an insuperable difficulty in many cases. Large-necked square bottles can be bought cheaply enough at Bristol and elsewhere, and it is those of a size capable of holding from 2 lbs. to 3 lbs. of fruit and syrup that should be used.

Because there are Pears grown specially for stewing purposes—being fit for nothing else, in fact—it does not follow, as many seem to imagine, that ordinary dessert varieties are not equally well adapted for the purpose. If enormous crops of Williams' Bon Chrétien, Pitmaston Duchess, Beurré Capiaumont, Beurré Diel, Clapp's Favourite, Durondeau, Brockworth Park, and numerous other varieties that could be mentioned, cannot be sold at remunerative rates either direct from the trees or after storing, there is nothing to prevent their being stewed and bottled. Nor need the fruit to be fully ripe; but on the contrary matured, but not ripe, Pears are to be preferred for the purpose. Lightening the crops might be commenced in time for the operation to be most beneficial to the trees, and consequently the fruit left on them would improve in size, while the thinnings could be bottled. Supposing it was intended to bottle the bulk of the fruit grown the work in many cases might commence with the thinnings, and continue as long as the fruit remained sound.

Not being actually engaged in the industry of preserving fruit for the markets I am not prepared to fully describe the best process of bottling Pears. Nor is there much likelihood of those experienced in the matter coming forward to give novices the benefit of their experience. This is not greatly to be wondered at; but what is to prevent anyone perfecting their own system, or, as before hinted, experimenting on a small scale now with a view to being prepared for future emergencies? My plan already put into operation is to select Pears of near one size as possible for each boiling, these being pared, halved or quartered if very large, and the core cut out. They are placed in a preserving pan, adding water at the rate of 1 quart and loaf sugar at the rate of 1½ lb. to every 16 lbs. of fruit, a few cloves and some allspice being also thrown in. They must not boil, but be kept on the simmer till the Pears become quite tender, this taking from two to four hours according to the variety and the ripening stage at which it may have arrived. The Pears are then allowed to cool somewhat and then very neatly packed in the bottles, the syrup being brought to the boil again and poured over the fruit so as to well cover it. Corking follows closely upon this, the corks being further made air-tight by means of oiled papers. It remains to be seen how long Pears thus treated will keep, and I have no doubt some of the readers of the *Journal of Horticulture* could, if they would, enlighten us more fully on the subject.

Colouring matter would appear with many to be absolutely necessary in the case of stewed Pears; but the Americans are evidently not of that opinion, and there are persons in this country who also object to its use. A few drops of cochineal will give the desired tinge of colour, and, I believe, without prejudice to the fruit; but there is no sense in using it, all the same. There is one variety that colours naturally, this being the good old Vicar of Winkfield. Planters seem to have quite overlooked the value of the Vicar. It forms a fairly good standard and a handsome pyramid, while against a cool wall the trees attain a great size. Very rarely are there failures to be recorded, and in addition to being one of the best stewing Pears in cultivation, it is often very acceptable for dessert purposes early in December. That, and also Beurré Diel, ought to be largely planted by those who intend to try what can be done in the way of bottling Pears for the market. It is my belief it is the last named that is largely sent over from California in tins.—W. IGGULDEN.

THE THEORY AND PRACTICE OF SPRAYING.

INSECTS and fungi are the principal agents which reduce the value of crops, but since the grower has, at his command, means of destroying these pests, he has, as a rule, no one but himself to blame if he is much troubled by them. By spraying plants with suitable materials, a good crop can almost be guaranteed, provided that the conditions for the healthy development of the plants are present. Spraying in itself will not produce good crops, but it will prevent injurious agencies from affecting the crop which would naturally be produced. It is an operation which is designed to protect plants, not to make them grow more vigorously or to bear more profusely, although these results are, nevertheless, indirectly obtained. An injured plant will not do so well as a sound one; a Vine covered with mildew cannot be so vigorous as one not so affected. Countless instances could be brought forward to show how plants have lost all their foliage through the action of insects. But whether the foliage is ruined by insects or by fungi, the effect upon the plant is the same, checked growth and a loss of vigour. Thousands of pounds are annually lost on account of the injury done by fungi and insects. Almost every cultivated plant has its enemies, but almost every one of these can be overcome by persevering and intelligent application of remedies within easy reach.

The substances used in spraying may, in general, be divided into two classes, insecticides and fungicides, the former being used against insects, the latter against fungi. Insecticides may further be divided into two classes, according to their mode of action; those which act after entering the body of the insect, with its food, and those which kill by coming into contact with the external surfaces of the insect's body.

This division of insecticides is an important one. Take for instance the Potato beetle. This insect is a voracious feeder, and by placing some poisonous substance upon the foliage which is eaten by it, the poison enters the body with the food, and the beetle soon stops work. Currant worms, caterpillars, curculios, in fact all insects which feed upon the external tissues of plants may, with but one or two exceptions, be destroyed in this way. It is the easiest and cheapest method, and should be employed as far as possible. The insecticides which are commonly used are Paris green, London purple, white arsenic, and hellebore. Paris green is the safest, but the most expensive of the arsenites. Its arsenic is mostly in an insoluble form, hence it does not injure foliage so much as the others. It is generally used upon all plants at the rate of 1 lb. in 200 or 300 gallons of water. Peaches are very easily injured by arsenites, and Paris green is the only safe one to apply, but even this should never be used stronger than 1 lb. to 300 gallons water, and still weaker solutions give good results. The spray should be very fine, and the foliage should be covered as evenly as possible. London purple contains a large amount of soluble arsenic, and for this reason should never be applied to Peach trees. I have also seen Plums seriously injured by its use. It is generally applied at the same rate as Paris green, but the foliage is more apt to be scorched. The soluble arsenic may be rendered insoluble by adding a gallon of the milk of lime to every 15 gallons of the London purple solution. When thus prepared London purple may be used with perhaps as much safety as Paris green.

White arsenic is a dangerous substance, as it is so readily mistaken for other white powders. When used alone it is caustic to foliage, but the following treatment, recommended by the North Carolina Experiment Station, is said to make its use perfectly safe. Boil 1 lb. of commercial white arsenic and 2 lbs. of unslaked lime in 2 to 5 gallons of water for about half an hour. Dilute in 100 or 200 gallons of water before using. Hellebore is a vegetable product, and should be used upon plants which require spraying before the fruit comes to maturity.

Insecticides which kill by contact are used against insects that suck the juices of plants. It is of no avail to try to destroy these pests by placing upon the surface of attacked plants those poisons which are effective only when eaten, as the beak of the insect passes through the external tissues of the plant before any food is taken. These insecticides, as a rule, are more difficult to prepare and apply than are those of the first class, but their use is often a necessity. Sucking insects generally have soft and tender bodies, readily penetrated by poisonous substances, such as kerosene and others which are fatal to the insect. In spraying these insecticides upon the plants, the aim should be to strike the insect, and not to cover the foliage with a coat of poison. If the insect escapes untouched, it will continue in its work as before. It is often hard to reach the enemy on account of the foliage, bark, or other protective substances; but the excellent insecticides which we now have at our command in most cases insure the destruction of the pest, especially if a good nozzle and pump are

used in making the application. However, before any insecticides are prepared it is necessary to determine in what manner the insects whose destruction is desired obtain their food. I once saw a man applying London purple to his Pear trees to destroy a sucking insect. Time, money, patience, and faith are all thrown away in such an operation.

Kerosene emulsion is a good insecticide of this class. There are several formulas according to which it may be prepared. The following will give satisfaction:—Softsoap, 1 quart; kerosene, 1 pint; hot water, 2 quarts. Churn the materials by pumping back into the pail until well mixed. This should be diluted two or three times before being used.—E. G. LODEMAN (in "American Agriculturist").

IRIS IBERICA AND I. SUSIANA.

THESE—two of the most singular and beautiful species of a large and most interesting genus of hardy plants—are not very frequently seen in gardens. This may arise from the prevalent but erroneous impression that they are amongst the most difficult of plants to flower, and require special treatment. As a matter of fact, they are easily cultivated, perfectly hardy, and not at all exacting in their requirements. *I. iberica* is a handsome plant, though its leaves are few. They are produced in a basal tuft, falcate, linear, and glaucous, and the stem does not exceed 6 inches in height, yet the flower is very large, often being 6 or 7 inches in length and 4 inches in breadth. The species flowers in spring or early summer. There are several forms, some being dwarfer than others, and these, as a rule, produce the most striking and the handsomest flowers. The blooms are solitary, the limb about 3 inches deep, with the segments narrowing to a short claw, $1\frac{1}{2}$ to 2 inches broad; the drooping petals or falls reflex from near the base, and are veined with dark purple or purplish-brown on a yellowish ground, with a velvety attractive dark purple blotch in the centre; while the upright petals or standards are satiny white or pale lilac, veinless, yet pencilled and spotted with violet. There is a variety with white and another with yellowish falls, both veined with purple-black lines, and spotted and blotched with bay, the standards being veined and thickly spotted. In procuring rhizomes of this species it is almost certain that there will be several varieties and decided improvements on the common form, for this plant exhibits no departure from the well-known fact that cultivation improves the types.

I. Susiana (the Mourning Iris) is described by Linnæus as "the single-flowered bearded Iris, with the stalks longer than the leaves." The limb is 3 inches deep; the falls and standards are similar in shape and size, with dense fine lines and spots of brownish-black on a grey ground tinged with lilac; the falls reflex about half way up; the claw is cushioned with brownish-black hairs, whilst the standards are erect and much spotted. The flower is one of the largest of the Iris family, and when closely examined one of the most elegant, being composed, like those of the other Irises, of six petals, amongst which appear the three leafy heads of the style, so much resembling three others that the flower has been usually understood to be nine-petalled. It has no scent, but its beautiful colouring is enough to suggest a resemblance at a distance to the feathers of some Indian bird. The flowers are produced in late April or early May. The stalk is from a foot to 18 inches high, round, thick, jointed, and pale green; the leaves rise six or eight together, and surround one another at the base. The root is tuberous, thick, irregular, and succulent. It is a native of the East (Asia Minor and Persia), whence it was brought into Europe by the Dutch in the year 1573.

These charming plants are best grown in a sunny situation sheltered from north, west, and east winds, but open to the south. The site should, in fact, be light and warm, and the soil thoroughly drained. The best bed I have seen was formed in a sunny nook, having low shrubs at a little distance on the east, north, and west sides. The soil was taken out 2 feet deep, as it was a mere gravelly brash, with 6 feet of ferruginous gravel below, resting on chalk, and the water never rose within that distance of the surface. A foot in depth of black earth was taken from the rubbish heap, which contained every kind of stuff from the potting bench, and was of a rather strongish nature, yet friable from the large percentage of crocks, and was put on the gravel, then another good foot was made up of soil consisting of dark rich turfy loam and leaf soil in equal parts taken from a wood, and a coating of sharp sand 4 inches thick was mixed with the surface soil to a depth of about 10 inches. The centre of the bed was occupied with the Susian Iris about 18 inches apart, and it was margined about 9 inches from the edge with the Iberian Iris.

The roots of the Iris *Susiana* were planted about 4 inches deep, being placed on about 2 inches depth of coarse sand and about that

thickness spread over them. The rhizomes of *Iris iberica* were planted similarly, but only just below the surface, say a couple of inches—indeed the sand was visible. The sand kept the rhizomes comparatively dry in winter and prevented their decay. They were not disturbed, but allowed to grow, and instead of dwindling away, as is often the case when they are “stuck in” mixed borders, they increased in beauty annually, and were the most admired of the many choice plants the garden contained.

I. iberica can be easily multiplied by division of the rhizome in autumn, and *I. Susiana* may be increased by parting the roots at that time. It is said that plants raised from seed excel in flower those increased from the roots, and afford a more pleasing diversity in the disposition, form, and size of the spots. Of that, however, I have no experience. *I. Susiana* does not succeed in heavy soils and cold districts as a border plant.—G. A.

JUDGING HERBACEOUS FLOWERS.

REPLYING to “E. M.,” page 235, I think the small growers of hardy flowers will be able to hold their own in competition if only one variety of any flower is allowed. Are not these small growers more likely to have but one or two kinds of any flower than a greater number, as most persons like variety in their gardens?

He must be a very small grower who could not compete in a class for twelve bunches, distinct. Should anyone decide to increase his stock of hardy plants it would be good for the trade and in many cases for the appearance of the purchaser's garden. I agree with “E. M.” that there is a wide distinction between the *Liliums* he names and, I may add, in their time of blooming.

My reason for allowing only one variety of any flower in a stand is that I consider it would be easier to judge them on their merits. I should like to have opinions on the following: Let two stands of twelve bunches be staged, one containing twelve distinct varieties, all being good specimens and well arranged, the other stand to have eight bunches distinct varieties, the remaining four may be two kinds of *Phlox* and two *Liliums* or *Delphiniums*, &c., &c., each bunch being good of its kind and well staged; to which stand should the first prize be awarded?—DEVON.

FUNCTIONS (AND WEIGHT) OF VINE LEAVES.

I CAN assure the correspondent who has thought fit to shelter his identity under the *nom de plume* of an ancient and honoured town that he has by no means succeeded in doing so. I venture to assert that both Mr. Iggulden and myself will be able to state our views without resorting to gross personal attacks; and I make bold to express the belief that readers of the *Journal of Horticulture* generally will require the adverse opinion of a far greater authority on Vine culture than this nameless individual. The test of experience is displayed in the results achieved. Mr. Iggulden would, I think, be the last to accuse me of a want of practical knowledge in any branch of fruit culture. It so happens that for a period of five years, during which time I was foreman to that prominent fruit grower, Mr. H. W. Ward, Mr. Iggulden and myself staged side by side in competition many collections of fruit and Grapes, and we have known what it is to stand together by the show tent awaiting with intense interest the verdict of the judges, who seldom had a very easy task to determine the positions of each collection. Let me now inform my critic (page 391), who is so tender on the subjects of “hurting other men's feelings,” that I am looking forward with great pleasure to see Mr. Iggulden at Warwick Castle Gardens. It is now only necessary for me to add that it is not the “product of the brains” of such Vine growers as my latest critic, that I should even wish to take credit for. If he has anything more to say in the matter let him come out of his retreat like a man, and I will recount some further experience in which he may be interested.—H. DUNKIN.

I HAVE been interested in all that has been said on this subject, but cannot agree with Mr. Iggulden. I always like plenty of growth. If less growth would do then I am wasting space in our vineries. When I came here six years ago I found four vineries, the Vines weak and covered with bug. They had been pruned close, the spurs being about 4 inches long. The Vines are between twenty and thirty years old. One Black Hamburgh house had ten Vines in it. I cut out six, spreading the remaining four over the whole roof, and allowed the growths to fill up the extra space. Plenty of them are 4 feet long. The laterals were allowed to grow wherever there was room. I did not prune close, but to a good bud, and continued the same course. Of the four Vines I destroyed two, thinning the remaining two alike. During the last five years I have grown more Grapes than were produced on the four Vines, and the quality is pronounced to be good by the owners. In short, the crops have been heavy, wood strong and well ripened, foliage large and leathery, and this year I have had the best crop, which goes to prove that the roots are at work. I have a leaf before me now 14 inches across, which I will forward. Mr. Iggulden speaks of the Gros Colman on the hard-stopped lateral. That I can quite understand when all the rest of the rod is clothed with laterals,

because I do not think it matters much where the extra growth is so long as there is a fair amount allowed until the Grapes are ripe. I am no writer, but am fond of growing good Grapes, also pleased to give my experience.—G. AYRES, *Marley Hall Gardens, Staffs.*

[The leaf is a good one. Our correspondent appears to favour large Vines and short communications. We have some too long for insertion in the present issue.]

PIPTANTHUS NEPALENSIS.

THE present being an excellent time for planting, we may with advantage call attention to that rare and little-known Indian shrub *Piptanthus nepalensis* (fig. 59), sometimes known as the Evergreen Laburnum. Though it bears some resemblance to one of our most common and beautiful flowering trees, yet it can be easily distinguished from it at a glance by the most casual observer. It is one of those numerous old inhabitants of our gardens that deserve to be rescued

FIG. 59.—PIPTANTHUS NEPALENSIS.

from the obscurity and neglect into which they have fallen owing to the continued and extended introduction of novelties.

It is of branching habit, but not bushy, and seems to need support of some kind, as it has a rather straggling appearance. Trained to a wall it both succeeds well and is very pretty during May and early June, as it flowers abundantly when in good condition. But it is far from being common, though it is quite hardy in most parts of England. It needs the protection of a wall in the northern and colder districts, but in the south it is rarely injured, even if planted in the open.

The name given above is the one by which it is best known, but it has several synonyms, *Baptisia nepalensis* being one that is occasionally seen, and more rarely *Thermopsis nepalensis* and *T. laburnifolia*.

NON-SYRINGING AN ANTIDOTE FOR MEALY BUG.

I HAVE been much interested in reading what has been written at various times on mealy bug in vineries, and as anxiously have I waited the result of an experiment I tried on an old vinery nearly four years ago. I now wish to make my experience known for the benefit of all who will give the plan a trial.

On taking charge of a garden on the 1st November, 1888, I found an

old lean-to vinery so much infested with mealy bug that I was told for years a considerable portion of the Grapes grown in it were not presentable. I do think one could imagine a house more unlikely to be cleaned than it was, being very old and partly decayed. Yet I am pleased to say it is now perfectly clean, and that chiefly through non-syringing. The first winter we cleansed the house as well as possible, also the Vines, but they were scraped except about the spurs. They were then dressed as usual and the border attended to; but I thought if syringing was practised at starting the Vines, all our compound would in a week be washed off; then what was to prevent the bug reappearing as numerous as ever?

These considerations induced me to try starting the Vines without syringing, maintain atmospheric moisture by evaporating pans, and the usual damping two or three times daily according to the weather. This we did, and the Vines broke as well as if they had been syringed every day, but in due time a few insects appeared, but were disposed of by a small brush dipped in petroleum kept in the house for that purpose. That year we had two bunches of Grapes spoiled notwithstanding all our care. The second year the same routine was strictly observed and only one bunch spoiled and fewer insects appeared. The third year we had fewer still, and all the fruit was clean. This season only two insects were noticed and destroyed, so that I can now pronounce our old vinery clean. The Vines and fruit are much improved, though only on two occasions during the last four years was the syringe used when a little spider made its unwelcome appearance. I can strongly recommend any of your readers who may be troubled with mealy bug in their vineries to try the non-syringing system, and I feel confident they will be pleased with the result.—R. R., *Belfast*.

HARDY FLOWER NOTES.

COLCHICUMS AND CROCUSES.

THE Colchicums, too, are in the fulness of their beauty, with flowers of purest white, of blushing pink, of pale purple, or of ruby crimson. They seem as if they had purposely planned that their foliage should not appear until spring, in order that the beauty and elegance of the flower tubes should be fully exposed to view. These same tubes are very beautiful; some like white enamel, and others beginning with white below and passing upwards into pink and pale purple, and into the ruby crimson already mentioned. Perhaps the finest of all in flower at present is the splendid *C. veratrifolium*, with larger and deeper coloured flowers than those of *C. speciosum rubrum*, so deservedly admired by all. One's powers of description of colours seem utterly inadequate to describe that ruby-purple or crimson which seems the prevailing shade of this fine Tulip-like Meadow Saffron, that has hues unlike any to be found in the Tulip race, wide as the range of colours is in those gallant flowers of spring. Fine, too, is a pale coloured one I have as *C. Bertoloni*, which is of palest pink, and is less chequered than many of the genus. Then the double white, one of the most prized of all, is of almost matchless beauty, with flowers which seem as if they had been made of the whitest and most perfectly polished ivory.

We now, too, look with deepest admiration upon the veined and feathered flowers of *Crocus speciosus*, the "blue" *Crocus* with its showy yet tasteful purple-blue flowers, which open their cups gladly to the autumn sun. We have many of these autumn-flowering Crocuses now hastening on as if afraid lest they should be too late to enjoy even the languid sunshine of our late autumn days. Of these more must be said another time, for there are yet many other flowers now pleading for notice ere the frost spirit shrivels them with his icy breath.

It seems as if *Linum flavum* (misprinted *Lilium* in my last notes) would bloom on until the frost comes. It has been well nigh unapproachable in its brightness all the season. It is undoubtedly thoroughly "at home" here, and we have never seen it surpassed.

KNIPHOFIAS OR TRITOMAS.

It is undeniable that the brilliancy and effect of our gardens at this time are greatly enhanced by the presence of these Torch or Flame-flowers. I fear we are, however, travelling in a wrong direction in our search for variety in these flowers. Introducers of new varieties seem to be working to attain early flowering and yellow flowered Kniphofias. While I am heartily in accord with those who desire plants which are not cut down by frost before they have attained their fullest beauty, I feel that to have the Tritoma with us all the summer would result in us looking upon it with comparative indifference, whereas now we look forward to these great and brilliant spikes of bloom which shoot up so rapidly from the dense reed-like foliage and lighten the garden in darkened days. Now it is a flower receiving a warm welcome, but let us have it from May onward and then the result will be—neglect.

Then as to the colour, there is no gainsaying the fact that we have a superabundance of yellow flowers in autumn. It is true these are mostly Composites, and the distinct form and presence—if I may so call it—are in favour of the Tritomas. Let us, however, seek shades of crimson, and then, with Kniphofias, Sunflowers, Rudbeckias, Harpaliums, Asters, Colchicums, and Crocuses, we would have gardens of hardy flowers in their way as delightful as in spring; gardens driving away by their brightness the thought of the passing year, and gardens which would show the wealth of beauty hardy flowers can give us at all times.

Why, then, are the Kniphofias not more frequently met with than at present? Some are of delicate nature, but the varieties of *K. Uvaria*, the old sort, the hardiest of all and still one of the best, will do almost

anywhere, requiring in some cold districts a slight covering with litter in winter. With me the plants generally preserve their foliage throughout the winter. *K. Uvaria* is now comparatively cheap if purchased in quantity; but where expense is a consideration, a stock can be readily raised from seed, and the plants should flower about the third season. I have a clump which is yielding about thirty spikes this year; it is composed of seedlings now some six years old. Many plants from the same sowing were given away; and so easily are they raised from seed sown in a gentle heat in spring, that our large gardens might in a few years, and with little expense, have great masses giving hundreds of flowers.

The Dutch growers, or some of them, at least, plant the crown of the plant a little beneath the surface. This, they say, enables the plant to resist more successfully the severities of their climate, and with a covering of reeds is sufficient protection for all but the delicate sorts. A great point in the cultivation of the Kniphofias is to give them a soil dry in winter but with copious supplies of water in summer. These stately flowers deserve more attention, and where used with judgment, the grower will have no reason to regret the trouble involved.—S. ARNOTT.

DISCUSSION ON APPLES.

COX'S POMONA.

I AM somewhat surprised to see so little reference to this variety in the interesting notes on Apples which appear weekly. In this neighbourhood (Warwick) it is highly prized, both for its good cropping qualities and fine attractive looking fruits. Bushes on the Crab stock have during the last two seasons been loaded with highly coloured fruit. On the stock indicated the trees make good but not extra strong growth, and by keeping the branches thinly disposed, according to my experience during the last two seasons, a good crop annually is almost a certainty.

MANCK'S CODLIN.

I PREFER this variety to Ecklinville Seedling, as it crops equally well, and the beautiful yellow colour the fruits attain when ripe renders them especially attractive. For a market Apple it seems to me to be well nigh perfection.

HANWELL SOURING.

THIS seems to be one of the best cooking Apples planted extensively many years ago. I have old standard trees growing in an orchard, which produce much finer fruit than old trees usually do. We recently gathered a capital crop of large fruit, which might easily be taken for the produce from young trees. Although we have so many fine cooking Apples to choose from now, I think intending planters will do well to plant a few trees of this variety, especially in districts where the soil is light. Our trees are growing in a very open soil, and on a steep bank.

TYLER'S KERNEL.

THOSE who require large Apples should plant this sort. The fruit partakes somewhat of the Blenheim type, except that it is much more conical in shape. This Apple is seldom seen except in the largest collections.

HARVEY'S WILTSHIRE DEFIANCE.

THIS Apple was recommended to me as being first-rate, either for dessert or culinary use. In conversation with the representative of a large fruit nursery I learnt they had grown this Apple for ten years, but had not succeeded in fruiting it. From that I decided to plant the tree high; the consequence is the second year of growth it has given us several very fine fruits. The shape may not be of the best, but it is certainly a striking Apple.—E. M.

EXTENSION VERSUS RESTRICTION IN FRUIT TREES.

THE interesting discussion on the functions of Vine leaves turns upon a point of which the bearing may be traced in other fruit trees. Is extension or restriction the better course? That is the real question at issue, and it would be a profound mistake to limit its scope to Vines. A fortnight ago I had the pleasure of a visit to the Old Nurseries at Cheshunt, and the privilege of being conducted over them by their respected proprietor, Mr. George Paul, who has for years been an active worker in the van of horticultural progress. A few hours with him are a valuable investment of time to all seekers after information. With no reference to the Vine question, but as a course of independent thought founded on long observation, he drew my attention to the advantages of gently coercing Nature rather than violently opposing her in the management of fruit trees. His remarks did not apply to one kind or class of tree alone, and the most eloquent emphasis was lent to them by

the condition of the trees in his splendid nursery, which visitors find—perhaps sometimes to their surprise—is not only, as Mr. Raillem has so aptly described it, “the ancestral home of the Rose,” but also a home for a very remarkable collection of hardy fruits.

THE LESSON OF THE CORDONS.

A great fruit expert not long ago related to me with keen enjoyment how, when visiting the garden of a writer who had made himself an authority on the formation of trained fruit trees some years ago, he found the most perfect examples of skilful training that the mind could conceive. They were in all sizes and all forms, models of beauty and symmetry. There was only one drawback to them—there was not a fruit to be found in the whole collection! The only produce on the place was yielded by the trees that had escaped the “improver’s” hand and been left to Nature’s training. It must be clear to anyone who is in the habit of visiting gardens in which fruit is grown that cordons are too often restricted to starvation point. Are these trees always worth the time and labour expended upon them? I venture to doubt it. Three or four meagre Pears a year are frequently the extent of their crop, and sometimes there is no fruit at all. I have invariably noticed a great difference between trees that have a good length of wall to travel over before the ultimate stopping takes place, and those which are never, so to say, “given their heads.” This is another instance of extension *versus* restriction, and Mr. Paul pointed out to me, in his extensive collection of trained trees, a still more convincing lesson. Some trees that have been checked in order to keep them of the character that is expected of cordons when purchased, follow the orthodox lines of bearing by giving a fruit here and there; but in other trees the side shoots have been allowed to advance and mature instead of being pinched, and are bearing at least six times the quantity of fruit that the others carry. Not only is it more abundant, but it is larger and in every respect finer.

These trees are growing side by side in the same soil, under exactly similar conditions, and the only difference of treatment lies in the energies of the trees in the one case having been kept severely in check, while in the other a natural outlet for them has been permitted. Surely this teaches a very significant lesson, and tells us that a far more cogent reason than convenience of gathering is to be advanced in favour of oblique training. The nearer the horizontal that the trees are trained the greater the length of wall before them, and I would suggest that where in the case of low walls early stopping of the leader has to be practised in order to keep the trees below the top, and virtual if not actual barrenness results, the trees should either be lifted and replanted at a more obtuse angle, or the wall be surmounted by a fence of wirework stretched espalier-like along the top. The beneficial results of the latter system cannot be better displayed than at Manresa House, Roehampton, where practical Mr. Davis has resorted to it for his Pear and Plum trees. In either case room for extension is provided, and its good effects will speedily manifest themselves. The latter plan is preferable to that of greatly depressing the trees, which, as I shall presently endeavour to show, is itself a species of restriction.

STANDARD APPLES.

In trade circles the reputation of the standard Apples at Cheshunt stands as high as that of the Roses does with the general public. They are a very remarkable collection both in extent and cultural excellence. Lines of trees stretch a quarter of a mile or more in length, and they are a sufficient distance apart to allow of horse labour between them. Here is a batch of 1500 Bienheims, there 800 to 1000 of Ecklinville Seedlings, and other popular varieties are also largely grown, the total number amounting probably to 70,000 or more. This, be it understood, represents standards alone, other classes of trees being also grown largely. It would be difficult to imagine more admirable specimens of planting standards, the stems being thick, vigorous, and upright. I particularly noted the sturdy character of the stems, and it is worthy of note that the splendid foundation they provide has been obtained by permitting a little growth extension. Instead of the stem shoots being at once removed they are allowed to make growth for the special purpose of thickening the stem in the earlier days of the tree. Thus the younger members of the plantation are feathered with foliage up to the branches. The shoots are of course ultimately removed, but not until they have served a very useful purpose of the nature indicated. Here again is an instance of the advantages of extension as opposed to restriction. Only those who see the trees can realise the full benefits of the cultural treatment adopted, and it is only bare justice to them to state that I have never seen a more remarkable example of nursery practice than that of the Cheshunt standards.

TRAINED TREES.

The trained trees are equally excellent in their way, and the same non-restrictive rule runs through the practice. The stock is

not represented by a tree here and there amongst quarters of other classes, but a large breadth of them are growing together, and they are very striking. I believe that they are the special work of Mr. Paul, jun., who has graduated in a good school and thoroughly digested its lessons. The rule adopted throughout is to train diagonally instead of horizontally. Now this in a sense is following out the extension principle, for if it be correct that the natural flow of the sap is more free in the perpendicular than the horizontal direction, it must follow that any departure from the latter in the direction of the former is a concession to Nature and a tendency to extension instead of restriction. The results at Cheshunt are full of significance. There is equal neatness in the diagonally trained trees, and there is superior vigour and productiveness. This should tell us that there is a great unifying principle running through plant life which it is better to guide than to oppose. Mr. Paul teaches a life lesson with his cordon, standard, and trained trees which others have played with as a mere physiological theory. For this not less than for the information derived from a pleasant hour in his richly stored library with its rare old volumes, I have reason to gratefully remember a passing visit to the old Rose home.—W. P. W.

CHRYSANTHEMUM SHOWS.

THE following Chrysanthemum Shows, which have been advertised in our columns, will take place during the ensuing week. We append the names and addresses of the respective Secretaries. That marked * opened yesterday (Wednesday).

*Nov. 16th, 17th, 18th.—York. J. Lazenby, 13, Feasgate, York.

„ 17th, 18th, 19th.—Edinburgh. R. Laird, 11, South Frederick Street, Edinburgh.

NATIONAL CHRYSANTHEMUM SOCIETY.

THE annual dinner of the National Chrysanthemum Society will take place on November 30th at Anderton’s Hotel, Fleet Street. Sir Edwin Saunders, President of the Society, will occupy the chair.

THE NATIONAL CHRYSANTHEMUM SOCIETY.

If the resolution published in the *Journal of Horticulture* on page 404 represents the feeling of the Committee of this Society in relation to the complaint made against members of its Floral Committee by Mr. Godfrey of Exmouth, then does it sustain the opinion that the Society is governed by metropolitan growers, all of whom evidently do not banish from their minds their possible trade interests. That is the prevalent country estimate. The resolve of the officials naturally leads to the inference that they are in sympathy with the trade growers whose action, so seriously complained of, has been brought before them. If remarks are made at the table unfit to be heard by outsiders, they are unfit to be made at all. The publication of Mr. Godfrey’s complaint, and Mr. Wells’ exposure at the Aquarium, let in a flood of light upon the objects of certain persons in connection with the Society’s Floral Committee. As the Royal Horticultural Society has an Orchid and a Narcissus Committee, I suggest that a Chrysanthemum Committee be appointed also, from which dubious persons be excluded. Let the Committee meet at the Society’s offices weekly when there are no Drill Hall meetings. This would prove to be a very popular move in the country.—K.

CERTIFICATED CHRYSANTHEMUMS.

IN addition to the Chrysanthemums to which we referred in our last issue, the following varieties were adjudged first-class certificates at the Royal Aquarium last week by the Floral Committee of the National Chrysanthemum Society. To Mr. R. Cawte, Esher, for an incurved named Brookleigh Gem, a sport from Jeanne d’Arc, of a purplish shade. To Mr. C. E. Shea, Foot’s Cray, for Miss Dorothea Shea, a cross between E. Molyneux and Sunset. This is a promising Japanese variety of a large and striking appearance, the florets being reddish in hue, with a silvery reverse. To Mr. J. Agate, Havant, for Princess May, a large white Japanese of rather a thin appearance. Also to E. C. Jukes, Esq., Hadley Lodge, Barnet, for Japanese Anemone La Deuil, a charming variety of a crimson purple colour.

CHRYSANTHEMUMS AT BARTON-UNDER-NEEDWOOD.

MR. J. C. GRINLING of Barton-under-Needwood, who annually invites his neighbours to come and see his Chrysanthemums, has this year a collection of 145 varieties in 290 pots. Mr. Davis has arranged the plants along the sides of the house, with the colours so intermingled as to produce a very pretty effect. The blooms as a whole are thoroughly well developed, and the Japanese are particularly good, Etoile de Lyon, Vivian Morel, Florence Davis, Puritan, and Thomas Stevenson

being among the best. Of the reflexed King of Crimsons and Chevalier Domage are fine. In the incurved section Lord Alcester, Jeanne d'Arc, Mons. R. Bahuant, Mr. Bunn, and Alfred Salter are very fine. Mrs. Judge Benedict and Madame Robert Owen do credit to the Anemones; and Sœur Melaine is as pretty as ever among the Pompons.—H.

DR. WALKER'S EXHIBITING TUBES.

At the Crystal Palace Show the first class certificate was awarded to me, and not to Messrs. Shuttleworth & Co., Limited, who are wholesale agents, but not the wholesale agents of my patent tubes.—GEO. WALKER.

GRASSENDALE CHRYSANTHEMUM SHOW.

At this Show, held last Saturday, the 10-guinea cup presented by the President, A. L. Jones, Esq., for cut blooms, and to be won two years in succession, was carried off by Mr. Donald Forbes, gardener to Alfred Holt, Esq., Crofton, Aigburth.—R. P. R.

MESSRS. CARTER & CO.

MESSRS. CARTER & CO., the well-known seedsmen, have made a special feature of Chrysanthemums at their nursery in Houston Road, Perry Hill, near Forest Hill, for several years, and this season have shown far better than they have ever done previously. The group they arranged at the Crystal Palace would have taken first place at the majority of shows, and was without doubt one of the best yet seen at any exhibition. The plants were admirably grown, and bore very fine blooms. They have a large collection in their nurseries displaying the same qualities. About 2500 plants are grown, and these embrace a large number of novelties, some home-raised, others acquired from various sources. By far the best of the former is a variety named Rosy Morn, which is likely to prove a great acquisition to the list of exhibition Japanese. It is in the way of Sunflower, having the same smooth, soft florets, and shapely build, but the colour is a very pleasing blush or pale pink on the crown bud and bright rose on the terminal. Both are distinct and beautiful. It is a very sturdy grower. The National Chrysanthemum Society have awarded a first-class certificate to this variety. Another novelty that is well worth a good trial is a Japanese incurved, much resembling Lord Brooke in build, having the same shape and broad substantial florets, but the colour is deep bronze with gold tips. The variety is a strong grower and a free bloomer. It ought certainly to have a name, and to be well tested. There is also a seedling of the Wm. Holmes type, with very large deep rosy lilac flowers, that is likely to prove useful.

Many novelties of the last year or two are well represented. Thos. Stevenson, a crimson reflexed with gold tips, is very handsome. Vivian Morel is, as usual, very fine. W. A. Manda, which proves to be a distinctly late variety, is fine in colour but thin, and this appears to be its character everywhere. Edwin Beckett, Louis Boehmer, and Marie Hoste are all in excellent condition; so, too, is Mrs. J. Wright, which is well grown and, as represented here, extremely beautiful. Of Mons. Carrière there are several large blooms, while Mrs. Nisbet is equally good. Holborn Dragon exhibits the colour variation often shown by different buds. On the terminal it is rosy lilac, on the crown much paler, almost white in fact. J. Stanborough Dibben proves itself a very sturdy grower, and at Forest Hill is much broader in the petal than it has been seen elsewhere. It will doubtless take a very high place among the exhibition yellow Japanese. Lady Lawrence or Mrs. Beale is good on the terminal, but poor on the crown. In its best condition this lovely white is one of the most beautiful Chrysanthemums grown. Kate Mursell, the yellow form, has the same characteristics. Vice-President Audiguier is in admirable condition. This rosy Japanese is sure to grow in popularity. The yellow Japanese Mrs. Libby Allen is conspicuous for its fine broad florets. Holborn Rose, a tall Japanese, coming best on the terminal; Milner Holt, a very late yellow Japanese; and Miriam Carter, a late pink Japanese, were also noteworthy.

If the improvement exhibited this season is maintained another year there can be little doubt of the Perry Hill Chrysanthemums being nearly at the top of the tree.

THE PRIORY, HORNSEY.

IN more respects than one the Chrysanthemum is a flower of surprises. Not only do we find varieties cropping up, to blaze brilliantly for one season, and pale before other novelties the next, but new growers appear year by year, and in a very short time take prominent positions amongst exhibitors. A noteworthy instance of the truth of this may be pointed to in Mr. Rowbottom, gardener to H. R. Williams, Esq., a gentleman who has had a very large share in the work of improving the position and prospects of British fruit growing, but whose interest in horticulture embraces flowers as well as fruit. Helped and encouraged by a sympathetic employer sharing his own love for Chrysanthemums to the full, Mr. Rowbottom has made rapid strides to the front. He commenced showing three years ago, and signalled his accession to the ranks of Chrysanthemum exhibitors by modestly annexing twenty-one prizes. This was by way of giving his opponents a good taste of his quality, and warning them to look out for future squalls. Whether they trimmed their sails or not, the following season the rising Hornsey grower improved on his initial efforts by carrying off twenty-eight prizes, and this season he has gone still further ahead by taking thirty-nine. A considerable number of these are firsts. He has also captured the 10-guinea cup at Highgate, towards securing which he registered one win last season, has received two silver medals and one first-class certificate. This is a record to which any exhibitor might point with

honest pride. Mr. Rowbottom has now secured a more than local reputation, and may rank with Messrs. Beckett, Whittle, Shoesmith, Carpenter, Mease, and other of the leading exhibitors near London. He takes his successes modestly and quietly. May he continue to do so in the bright future that evidently lies before him, thus meriting the favour of a good master and the respect of the public.

Those who have been tempted to call at The Priory gardens by observing the splendid quality of the flowers at the Royal Aquarium, Kent County, Highgate, and other Exhibitions cannot fail to have been surprised at the great number of fine flowers which Mr. Rowbottom has managed to secure from a collection of about 600 plants. He has been exhibiting grand examples of the principal new and old varieties. When a call was made towards the end of last week he had Lord Brooke in most effective and promising condition, the flowers being large in size and with enormous florets. This novelty is likely to prove a great acquisition, for it has exceptional substance allied with a most distinct colour. All exhibitors should secure it. Apparently it will have to be classed with the Japanese incurved. J. S. Dibben was represented by an immense flower, and of Marie Hoste there was one of the finest blooms, if not the finest, ever exhibited. It would be difficult to give an adequate idea of the beauty of this lovely variety when in such condition. Hamlet, Etoile de Lyon, and Beauty of Castlewood are three older varieties splendidly grown at The Priory. The latter had florets $1\frac{1}{2}$ inch across. From three plants of Golden Dragon eight blooms of exhibition size have been cut. Mrs. Marian Thrower is a creamy Japanese, of which Mr. Rowbottom has had fine blooms. Colonel Smith was in splendid colour, and the same may be said of Alberic Lunden, which is so fine in hue and so effective that it will probably be in far more stands a year or two hence than this season. Coronet, by no means a good doer, is excellently grown, and so is Florence Davis. Puritan and W. Tricker are splendid. Mr. Rowbottom thinks so highly of them as to prophesy their being leading varieties twenty years hence. He also has a Japanese named Mme. E. Mulson that may become popular. It is about the same colour as Maiden's Blush, but of better build.

The incurved grown at The Priory have been amongst the best of the year. The flowers have run somewhat flat this season in most places, but those at Hornsey are deep and conical. Alfred Salter and Mrs. Robinson King are particularly fine. Empress of India, Queen of England, and Barbara are a trio of old varieties in beautiful condition. Mons. Darrier has been grandly grown and shown by Mr. Rowbottom. The bloom that secured the prize for the best incurved at the Kent County Show on the 2nd inst. formed part of a winning stand at Hornsey on the 10th, fresh, bright, and beautiful. This variety is a fine addition to the incurved section. One of the most noteworthy varieties in the other sections is the Anemone Pompon Emily Rowbottom, a blush sport from Marie Stuart, and the pale yellow Pompon Wm. Westlake is very fine also. Besides those named many other varieties have been carrying splendid flowers. The remarks made by Mr. H. R. Williams at the Hornsey Show prove him to appreciate not only the good work of his own gardener, but also that of others. He is prominent in encouraging all good horticultural work, and many plants find their way from The Priory garden to the cottagers in the neighbourhood, thus inducing them to make a start. This merits at least as warm recognition as the winning of innumerable prizes for the home flowers. May both continue.

NOTES FROM AN IRISH GARDEN.

HERE in the suburbs of the Irish metropolis the Chrysanthemum fever rages, though affording more pleasure than most epidemics. In this neighbourhood most growers complain of the late development of the flowers, owing probably to a cool summer (we missed the heat wave which reached other shores), and a spell of cold wet weather, lasting three weeks after housing the plants.

Here at the foot of the Dublin mountains spells of bright sunshine are common in November, though the city, but four miles distant, may be, and often is, enveloped in fog. Brighter days, with fire heat at night, are now rapidly changing things, and the flowers are fast developing, and one enjoys watching the results of past labours—a labour of love, though. Amongst Japanese Elaine is first, with fine, solid flowers of great depth and substance. Avalanche and Stanstead White are prominent, and will be good. Mrs. A. Hardy has behaved erratically this season. Bud-taking of this commenced the middle of July; the first flower was at its best the middle of September; from thence till now they have been opening, giving superb blooms of great size. Louis Boehmer large, improving in colour as it develops. Etoile de Lyon huge, and that is all; but in Vivian Morel we have substance and colour as well as size. Golden Dragon comes in good form here, and is now throwing out its clawed petals as a good dragon should. Sunflower, too, is in fine form, and Peter the Great gives fine deep flowers. E. Molyneux as usual is good, Mons. Freeman a chaste flower, and dwarfest of the dwarf in habit. Amongst incurves the Empresses, Queens, and the Princess type promise well, but are late. Robert Cannell is early, with flowers nearly as large as a dinner plate, and, alas! so far as flat; while Hero and its sports will not be in till end of the month.

The old (near sixty years of age) Royal Horticultural Society of Ireland will hold its two-days show November 17th and 18th; whilst unfortunately the two leading suburban societies fixed their exhibitions for the day previous, thus disappointing some growers who would like to compete in the open classes, but cannot see their way to interfere with their best efforts for the Royal Society's Show, nor handicap themselves by exhibiting flowers which had stood the dust and rubbing of a

musical promenade till 10 P.M. the day previous. A week earlier or later would catch earlier or later flowers, and prolong the season instead of, like one grand pyrotechnic display, wind up abruptly our season here in Dublin for 1892.—E. K.

ROYAL HORTICULTURAL SOCIETY.

NOVEMBER 15TH.

CONSIDERING the time of year there was a fair display of plants and flowers at the Drill Hall on the above date. Chrysanthemums were conspicuous, as also were Orchids, though fruit was not well represented.

FRUIT COMMITTEE.—Present: Philip Crowley, Esq. (in the chair), with Rev. W. Wilks, Dr. Hogg, Messrs. H. Balderson, F. Q. Lane, J. T. Saltmarsh, G. Taber, A. Dean, G. Bunyard, G. Wythes, and J. Wright.

As will be apparent the meeting was small, and only a limited amount of produce was placed on the table for examination.

Mr. Miller sent from Ruxley Lodge, Esher, fruits of Golden Ball Melon. The Committee desired to see the variety in the summer, as a just estimate cannot be formed of Melons at this late period of the year. Mr. Miller also sent a dish of second crop Brown Turkey Figs, very good for the season, and a vote of thanks was accorded. Mr. R. Gilbert, Burghley Gardens, sent fruits of Gilbert's Satisfaction Tomato, a flat well coloured fruit of excellent quality, resembling Laxton's Open Air. As it was described as a good forcing variety the Committee desired to see fruits in March.

Mr. Crowley brought specimens of Plums which had been dried by him on wire trays in an ordinary oven, and then prepared for use. They were very good. Dr. Hogg remarked that the practice of drying fruit in a similar way was common among the peasantry in France. Mr. Wilks and Mr. Bunyard both remember the custom in Kent, but it fell out of use when French Prunes became plentiful in shops. We can only say, "More's the pity." Mr. Crowley has revived the practice of domestic fruit drying, and more will perhaps be heard about it.

Mr. Braun, Walsall, sent large kidney Potatoes of Fidler's Colossal. Mr. Barron was requested to have samples cooked and report to the next meeting. The variety has been grown at Chiswick, where it produced haulm 6 feet long or more and a heavy crop of tubers. Those placed before the Committee were too large for table use, but of excellent shape and of great density.

Mr. G. Wythes exhibited about twenty Melons—a good display for the time of year, and a bronze medal was awarded.

Several consignments of Apples were sent to be named, and in one or two instances their market value was requested. The majority of the varieties were of local origin and practically worthless. Such samples placed in markets form the most effective invitation to growers in other countries to increase their consignments. It is pitiable to see the trash that is grown in ancient orchards and exhausted soil; and yet the "growers" complain of low prices and foreign competition! The remedy is in their own hands.

FLORAL COMMITTEE.—Present: W. Marshall, Esq. (in the chair), Messrs. B. Wynne, H. Herbst, C. F. Bause, C. T. Drury, G. Phippen, H. Cannell, C. Jefferies, C. J. Salter, C. E. Pearson, W. Furze, W. Bennett Poë, H. H. D'Ombra, J. Fraser, and G. Paul.

Mr. H. B. May, Dyson's Lane Nursery, Upper Edmonton, sent a splendid collection of Ferns, amongst which were some very choice varieties. *Pteris tremula variegata*, *Gymnogramma multiceps superba*, numerous *Adiantums*, and *Platyceriums* were most conspicuous (silver-gilt Flora medal). Mr. G. Wythes, gardener to the Duke of Northumberland, staged a collection of 140 Chrysanthemum blooms, the whole making a bright display. The flowers were fresh and tastefully arranged with Palms and Ferns (silver Banksian medal). Messrs. H. Cannell and Sons, Swanley, sent three boxes of Chrysanthemum blooms, some of which were adjudged awards of merit. These are described elsewhere. Messrs. Cannell also staged a number of Zonal Pelargonium blooms, the colours of which were exceedingly bright, and showed to advantage on a dull November day. Among others *Madame de Boudeville*, a charming light pink, may be mentioned as being particularly good (silver Banksian medal).

Mr. G. Miller, gardener to Lord Foley, Esher, sent a basket of *Marie Louise Violéts*, the flowers being large and fragrant. Mr. Chas. Blick, gardener to Martin Smith, Esq., The Warren, Hayes Common, Beckenham, had blooms of Chrysanthemum Mr. Chas. Blick, for which an award of merit was adjudged. Mr. C. E. Shea, The Elms, Foots Cray, Kent, also sent some new Chrysanthemums. Mr. E. Molyneux, Swanmore Park; Mr. R. Owen, Maidenhead; and Mr. J. Dibbens, Brockley; also staged new Chrysanthemums, all of which were passed. Messrs. J. Veitch & Sons had two boxes of Chrysanthemums, blooms large and bright, also a pan of *Begonia decora*, which was awarded a first-class certificate. Messrs. J. R. Pearson & Sons, Chilwell Nurseries, Beeston, Notts, sent new Chrysanthemums. These were adjudged awards of merit, and are described below. W. Seward, Esq., The Firs, Hanwell, also sent Chrysanthemum *Princess Victoria*, likewise referred to below.

Mr. G. Wythes was awarded the first prize for a group of Chrysanthemums in pots, showing well-flowered plants.

ORCHID COMMITTEE.—Present: H. J. Veitch, Esq. (in the chair), Messrs. J. O'Brien, S. Courtauld, E. Hill, W. H. White, and T. B. Haywood.

Orchids were fairly well represented. Messrs. B. S. Williams and

Son, Upper Holloway, sent a small group of *Cypripediums*, *Cattleya gigas*, and *Cymbidium giganteum*. Among the former *C. Petcherianum* Williamsiana, and *C. "Aclonis superba"* were most conspicuous. The latter is a new seedling of an attractive appearance. C. J. Lucas, Esq., Warnham Court, Horsham (gardener, Mr. G. Duncan), staged a splendid bloom of *Cattleya Massiana*, and two pieces of *Angraecum bilobum*. A spike of *Cattleya Harrisii* carrying four flowers was staged by Thomas Statter, Esq., Stand Hall, near Manchester. Messrs. F. Sander & Co., St. Albans, had a small collection, amongst which *Cypripedium Edithæ*, *C. alcides*, and *C. "G. S. Ball,"* all new hybrids, were noticeable. R. Young, Esq., Sefton Park, Liverpool, sent blooms of *Cattleya labiata* Young's var., and Mr. Houghton, Walthamstow, staged a grand spike of *C. labiata vera*, carrying six fine flowers.

Messrs. J. Laing & Sons sent a good variety of *Odontoglossum crispum*, and Sir Trevor Lawrence staged, amongst others, *Cypripedium Morganæ Burfordiense*. This was awarded a first-class certificate, and is described elsewhere. Messrs. H. Low & Co., Clapton, staged a small collection, tastefully arranged with Ferns and Palms. Messrs. J. Veitch and Sons, Royal Exotic Nursery, Chelsea, sent a small collection of choice species and varieties, several of which were honoured with certificates. Mr. J. Fitt, Paushanger Park, Hertford, sent plants of *Cypripedium insigne*.

Mr. C. E. Pearson of Chilwell Nurseries, Beeston, Notts, gave an interesting lecture on "Pelargoniums for Autumn Blooming" at the afternoon meeting, which was fairly well attended.

CERTIFICATES AND AWARDS.

Catasetum tabular (Welbore S. Ellis, Esq.).—The plant exhibited was carrying four flowers. The sepals and petals are of a dull red colour, the lip cream, heavily spotted with brown (award of merit).

Cypripedium Morganæ Burfordiense (Sir Trevor Lawrence).—A very fine variety, resembling the type somewhat in colour. The dorsal sepal is broad, veined with green and brown, the edge being white and pink. The petals are long and heavily spotted with chocolate, the lip large, and of a reddish brown colour (first-class certificate).

Cypripedium Persens (J. Veitch & Sons).—This is a hybrid between *C. Lindleyanum* and *C. Sedeni porphyreum*, and is of an attractive character. The specimen shown had one spike nearly 2 feet in length, and bore one fully expanded flower and several buds. The dorsal sepal is small and short, pale yellow, veined with bright crimson. The petals are narrow, about 1½ inch in length, light green in the centre, with crimson margins. The lip is reddish with a pale yellow throat, slightly spotted (award of merit).

Lælio-Cattleya Aurora (J. Veitch & Sons).—A hybrid between *C. Loddigesi* and *C. pumila Dayana*. The sepals and petals are of a rosy mauve shade, the lip being similar at the base, but with a rich crimson edge (award of merit).

Cypripedium Titys (J. Veitch & Sons).—This is a magnificent hybrid. It is the result of a cross between *C. cernanthum superbum* and *C. Spicerianum*, and possesses the colour of the latter. The dorsal sepal is large with a broad white margin, which makes a pleasing contrast to the greenish yellow and spotted centre. The petals are dull yellow and similarly spotted, while the lip is of a olive green shade. The following statement was staged with the plant:—"Four distinct species are concerned in the ancestry of this hybrid, thus: The seed parent is *C. Spicerianum*; *C. cernanthum superbum* was obtained from *C. insigne* var. *Maulei* and *C. Harrisianum superbum*; and *C. Harrisianum superbum* was obtained from *C. barbatum* and *C. villosum*." It is, therefore, an interesting cross (first-class certificate).

Cattleya labiata albanense (F. Sander & Co.).—This is a grand variety, the specimen shown carrying ten large flowers. The sepals and petals are rosy mauve, the front of the lip being rich crimson with a light crested edge (award of merit).

Chrysanthemum Lord Brooke (H. Cannell & Sons).—An incurved Japanese with a medium size bloom. The florets are of a moderate width, and old gold colour, tipped and suffused with red; a new and telling colour (award of merit).

Chrysanthemum Aida (H. Cannell & Son).—A Japanese variety of great promise. Florets deep pink with pale yellow tips, the centre of the bloom being yellow, quite new in colour and very pleasing (award of merit).

Chrysanthemum Mr. Chas. Blick (Mr. Blick).—This is a charming incurved Japanese variety of a bright yellow colour (award of merit).

Chrysanthemum Miss Dorothea Shea (Mr. C. E. Shea).—This is the result of a cross between *E. Molyneux* and *Sunset*. The flowers are large and of a dark crimson colour, with a pale reverse (award of merit).

Chrysanthemum Robert Flowerday (J. R. Pearson & Sons).—An incurved Japanese of an immense size. The florets are broad, bright crimson colour, with a silvery reverse (award of merit).

Chrysanthemum Mrs. Needs (J. R. Pearson & Sons).—A charming Japanese variety with narrow florets, which are white at the base tipped and edged with pale pink (award of merit).

Chrysanthemum Princess Victoria (W. Seward, Esq.).—A Japanese variety of great depth and solidity, white florets, and greenish yellow centre (award of merit).

Begonia decora (J. Veitch & Sons).—This is an ornamental foliage species. The leaves are rather small, of a dark brown or chocolate colour and rough surface, the veins being bright green (first-class certificate).

EVENTS OF THE WEEK.—The ensuing week will be a comparatively quiet one in horticultural circles. A few important Chrysanthemum exhibitions remain to be held, and a brief list of these will be found on another page. Several auction sales will take place, for particulars of which see advertisements.

— **THE WEATHER IN LONDON.**—Thick black fogs were prevalent in the metropolis at the end of last week. Sunday, however, opened more favourable, it being mild with occasional glimpses of sunshine. Bright and mild weather characterised Monday, but Tuesday proved dull and wet. At the time of going to press it is raining.

— **WEATHER IN THE NORTH.**—November 8th to 15th.—A week of dull, foggy, wet weather. The 10th was an exception; there was a slight touch of frost in the morning, and the day and evening were fine. The afternoon of the 14th and the evening were very wet. The thermometer has frequently during the week stood over 40° throughout the night.—B. D., *S. Perthshire*.

— **CYCLAMEN AT THE GLOUCESTER AND CHELTENHAM SHOWS.**—Messrs. Sutton & Sons of Reading were awarded six first-class certificates for beautiful and distinct varieties of Cyclamen at the Gloucester Show, whilst at the Cheltenham Exhibition they received nine first-class certificates. These flowers are now highly worthy of inspection at Reading. We are compelled to defer the publication of the report of the Gloucester Show.

— **FRENCH APPLES IN LONDON.**—According to an American contemporary France at the present time is "sending 20,000 packages of Apples per week to the London markets, and these are being sold at low prices." Immense quantities of foreign fruit, and much of it of an inferior nature, are now being sold in the metropolis, but the accuracy of the above statement is open to question. Albeit, well-grown British fruit always commands remunerative prices.

— **A NARCISSUS EXHIBITION.**—An Exhibition of Narcissi will be held in the Edgbaston Botanical Gardens on April 26th and 27th next under the auspices of the Birmingham Botanical Society, and it is hoped that representative collections and new varieties will be staged by cultivators. Classes will be devoted also to plants in pots to show their usefulness for indoor decoration, and particularly to encourage this object Mr. Robert Sydenham gives five prizes for twelve pots of curious varieties.

— **WOOLTON GARDENERS' MUTUAL IMPROVEMENT SOCIETY.**—The first of a series of lectures under the auspices of the Lancashire and Cheshire Association for the Extension of University Teaching was delivered by T. L. Bailey, Esq., Ph.D., University College, Liverpool, on Thursday, the title being "The Constituents of Plants, and Whence They are Supplied." There was a very fair attendance, and the lecture, being illustrated by experiments, proved very interesting, and gained the closest attention of the audience.—R. P. R.

— **HORTICULTURISTS AS MAYORS.**—It is gratifying to note that at least two horticulturists were selected for municipal honours last week—namely, Mr. Samuel Barlow, J.P., of Stakehill House, Castleton, as Mayor of Middleton; and Mr. W. Herbert Fowler as Mayor of Taunton. Mr. Barlow is a most enthusiastic florist, and Mr. Fowler is a well-known Chrysanthemum grower and exhibitor, he having secured the first prize for forty-eight Japanese blooms at the Royal Aquarium last week, in addition to other awards.

— **AN ADDITION TO WATERLOW PARK.**—The London County Council have undertaken to restore, under the direction of Mr. Blashill, Lauderdale House, which together with its own terraced and old-fashioned garden, is now included in Waterlow Park, Highgate. The park consists of 29 acres, the gift of Sir Sydney Waterlow, to which he added £6000 for the purchase of the freehold of a portion (2½ acres) then held on lease. The Council voted £4900 to defray the cost of adapting the grounds for public resort. The house was the home of John, Duke of Lauderdale, and it is said of Nell Gwynne.

— **HARDY TREES AND SHRUBS AT KEW.**—It is said that the arboretum of Kew, which was very small a quarter of a century or so ago, now contains over 3000 species or marked varieties of trees and shrubs.

— **FLORICULTURE IN THE SOUTH OF FRANCE.**—Floriculture is rapidly extending in the South of France. In certain parts of the Alpes Maritimes Rose-growing brings a profit of from 10,000 francs to 12,000 francs an acre. It is in winter that the flowers are most in request.

— **PLYMOUTH CHRYSANTHEMUM SHOW.**—We are informed by telegram that in the open class for forty-eight blooms at this Show Messrs. W. & G. Drover, Fareham, were first; Miss Frith, Teignmouth, second; and Mr. W. Herbert Fowler, Taunton, third. The Exhibition was held on Tuesday, November 15th.

— **AGAPANTHUS UMBELLATUS ALBUS.**—Your correspondent, "Rectory," page 416, in writing about this plant says that he cannot get it to flower. I have two plants of it, which flower beautifully every year, and they are treated exactly the same as the blue variety. The white ones that I have were brought to me by a friend direct from the Cape.—EDWARD COSTATE.

— **AUSTRALIAN FRUIT.**—An American paper says, "The last year's shipment of Australian fruit to London was profitless to shippers, owing chiefly to inferior packing. Another such a season will destroy the English market for Australian fruit." We are inclined to think that superiority of English-grown fruit will in future tell heavily against foreign productions.

— **TRENTHAM GARDENS.**—We are desired to state that Mr. Peter Blair has arranged with the Duke of Sutherland to remain with him as head gardener at Trentham instead of taking the Trentham Hotel, as previously arranged. The Duke and Duchess take a very great interest in the gardens, and Mr. Blair is the right man in the right place at princely Trentham.

— **THE WEATHER IN DUMFRIES.**—The weather here during the past week may almost be summed up in one word—rain. Saturday, 12th inst., was, however, dry nearly all day, but dull. Some days high winds prevailed; but, generally speaking, it has been calm. The rainfall has been heavy, and to-day (14th) there is no appearance of any improvement.—S. ARNOTT, *Dumfriesshire*.

— **A LEICESTER VEGETABLE SHOW.**—Messrs. Harrison & Sons' annual vegetable and root Show opened on Wednesday, November 9th, at the Market Hall, Leicester. The vegetables were staged in a very effective manner. The Show was, during the day, visited by hundreds of people. Compared with last year, the exhibits were of a far superior quality, and the entries were numerous, especially those of Potatoes, Onions, Leeks, and Carrots.

— **ARE ALL YEWS POISONOUS?**—Replying to a query asked by Earl Cathcart at the last meeting of the Council of the Royal Agricultural Society as to what was known as to the poisonous properties of the Yew, and whether the trees of one sex only or of both were poisonous, Mr. W. Carruthers, F.R.S., said the question whether the poisonous qualities of the tree were restricted to one sex only of the plant could not be answered in the affirmative.

— **ORANGE GROWING IN FLORIDA.**—It is stated that on Tuesday, November 15th, the steamer "Ethelwold," from Fernandina, Florida, started with the first cargo (15,000 boxes) of Florida Oranges ever shipped to England. This shipment will reach and be sold in London about December 5th. At the present time the United States produces six million boxes, each containing 200 Oranges. In a few years Florida and California will produce ten million boxes, three million at least of which, writes a correspondent, will have to go to Europe, "to avoid glutting American markets." The present cargo has been collected from 200 different Orange growers.

— **GHEENT INTERNATIONAL EXHIBITION, 1893.**—A circular has been issued by the Committee of the Ghent International Horticultural Exhibition in 1893 calling attention to its comprehensive character. It is pointed out that there are 660 classes, embracing a very wide range of material, from hardy and indoor plants of all kinds to objects of art and industry, that nearly 1500 medals will be offered, including a gold medal each from the King and Queen, and that space will be free to exhibitors. The circular concludes by stating that the Exhibition, which will be open from the 16th to the 23rd of April next, will be unique. More than 100,000 plants will be gathered together, as well as objects of art.

— AMERICAN GARDEN IMPLEMENTS.—In reply to your correspondent, W. R. Raillem, page 416, I wish to say that I have used one of the Combined Planet Jr. Garden Cultivators, and on very light friable soils, free from stones, I found it useful. For general use in England, however, these implements are not suitable. But I think they should give a hint to village blacksmiths to make tools that are handy if the Small Holdings Act becomes a practical matter.—R. MAHER.

— ANTI-BLIGHT.—Will you please tell me through the Journal the address of the manufacturers of Tate and Buchanan's Anti-Blight, also the vendors of the Melba Bellows? I cannot understand why people do not advertise their goods when they see them highly spoken of.—MILDEW. [Perhaps they can sell sufficient without. The agents, as we have several times stated, are Messrs. Barr & Son, and their address is usually to be found in their advertisement on the front page of the *Journal of Horticulture*.]

— MANAGER OF THE LONDON PARKS.—It is reported that the London County Council finally decided last week not to appoint a superintendent of the London parks at a salary of £700 a year, as was originally intended. The duties of certain present officials have been re-arranged, and Mr. J. J. Sexby, of the architects' department, becomes chief officer at a salary of £500 per annum. Mr. Sexby, although not a gardener, takes an interest in the profession, and for several years has been a member of the Committee of the Gardeners' Royal Benevolent Institution. It has also been decided to appoint a new officer having a special knowledge of horticulture at a salary of £300 a year, to act as Mr. Sexby's assistant, and to be called the assistant-superintendent.—P. S.

— DISEASE OF THE VINE.—The very destructive American disease of the Vine known as the "Black-rot" has, for some years past, made its appearance in Europe, and its life-history has now been thoroughly investigated by Viala, Ráthay, and others. The ravages of the disease have been traced to a parasitic fungus, *Læstadia Bidwelli*, the mycelium of which develops in the interior of the organ attacked, chiefly the young branches and berries, and produces spermatophytes and pycnids in the course of the summer. It is especially by the pycnosporangia that the fungus is disseminated. Towards the end of the period of vegetation sclerites are formed, usually within the pycnids, and the conidiophores spring from these. Perithecia are also formed in May and June on the fallen and infected berries of the previous year. Until recently the ravages of this pest in Europe were confined to the French vineyards, but it has recently been detected in Austria and in Italy. The most effectual remedy for it is salts of copper.—(Nature.)

— DISCHIDIA RAFFLESIANA.—The "Kew Bulletin" states that after many unsuccessful attempts to introduce living examples of this interesting plant, Kew has at last succeeded, thanks mainly to the generosity of Dr. Treub, the distinguished Director of the Botanic Gardens, Java, who sent a plant of it in a Wardian case two years ago. This plant is now established and growing freely, producing numerous large pitcher-like leaves as well as the small normal Hoya-like foliage. The morphological meaning of these pitchers has not yet been thoroughly worked out. "The species of *Dischidia* all want a careful study. They cannot be described satisfactorily from dried specimens. The leaves change in form, and it is not ascertained in respect of many species whether they may or may not be converted into pitchers (ascidia)."—Hooker in "Flora of British India." The plant at Kew is now under the special observation of Dr. Scott, hon. keeper of the Jodrell Laboratory. *D. bengalensis* is an old garden plant. It is cultivated at Kew in the Palm house. *D. Rafflesiana* is for the present kept in one of the propagating pits.

— SENDING PLANTS BY POST.—We receive evidence of the inability of persons to pack plants so that they may pass a day or two safely in the post only too frequently; what would they say to plants journeying 14,000 miles, spending five weeks in the post, and then arriving perfectly fresh? When at Swanley the other day Mr. Cannell showed us an original letter acknowledging the receipt of some plants by Messrs. D. Hay & Son, Montpellier Nursery, Auckland, New Zealand. It ran as follows:—"We have very much pleasure in stating that we received the two tins by post yesterday containing *Chrysanthemums*, *Carnations*, and *Pelargoniums*, and out of the whole number we do not think we shall lose one, as they all appear fresh. We are greatly pleased to say the *Carnations* are quite fresh. We also thank you for selecting such strong plants and for your liberal treatment. You cannot improve upon the system of packing with cocoa-nut

fibre, and the tins being strong do not get damaged in transit." This is a very good proof of what our skilled nurserymen can do in the way of packing. Mr. Cannell is proud of the letter, and well he may be.

THE GARDENERS' ROYAL BENEVOLENT INSTITUTION.

AMONG gardening charities the Gardeners' Royal Benevolent Institution occupies a foremost position, and it is no wonder that the fifty-third anniversary dinner, which took place at the Whitehall Rooms, Hotel Métropole, on Tuesday, November 15th, proved such a brilliant success. For upwards of half a century this splendid Institution has been carrying on its good work of rendering aid to aged and disabled gardeners and their widows, so that it has a strong claim upon the sympathy of all interested in horticulture. On the present occasion Lord Brassey, K.C.B., occupied the chair, and was supported by a large company, comprising about 150 gentlemen. Amongst others present were Lord Addington, Sir Trevor Lawrence, Bart., Sir J. Whittaker Ellis, Bart., Major-General Sherer, Major Sexby, Rev. W. Wilks, Messrs. H. J. Veitch, P. Crowley, W. Paul, N. Sherwood, H. E. Milner, W. H. Protheroe, J. Laing, A. W. G. Weeks, G. Bunyard, R. Cannell, and numerous other well known horticulturists.

Lord Brassey, after the customary loyal toasts, gave the toast of the evening—namely, "Continued Success and Prosperity to the Gardeners' Royal Benevolent Institution, now in its fifty-third year, coupled with the name of Mr. Harry J. Veitch, Treasurer." His Lordship said he would not trouble his hearers with a long speech, but would merely point out a few of the most important features of the Institution. The Society was a very old one, having been established in 1839, and made a small beginning. The income in the first year of its foundation was limited to the sum of £126. The object of the Institution was to provide pensions for men who had followed the occupation of a gardener, and who had been rendered incapable of earning their own living, also for their widows. When first instituted, the pensions were fixed at £16 for men and £12 for women, but since 1885 the scale had been raised to £20 and £16 respectively. The main feature of the Gardeners' Royal Benevolent Institution was that, while it administered to the relief of those who were in distress, it sought by every means in its power to inculcate the virtues of providence and economy. In 1851 the Queen and the late Prince Consort became the patroness and the patron respectively of the institution. Later on, in 1865, the Prince of Wales also kindly consented to become a patron. At the present time they had 156 pensioners, of whom seventy-nine were men and seventy-five women. These were maintained at a yearly expenditure of £2700. They would thus see that some good had been done, but the funds were still insufficient. Last year only fifteen were elected out of thirty-four candidates, and since then a large number of applications had been received. He therefore hoped that those present, and other donors, would do their best to increase the funds of the Society. In urging his hearers to extend their liberality to the Institution, his Lordship said he might appropriately appeal to their grateful recollections of the happy hours they had passed in gardens. England bore through all its length and breadth the marks of care and skill in its farms, its parks, and pleasant places, and in its innumerable gardens, both large and small. Shakespeare paid a tribute to gardening in some of his choicest lines. The debt they owed to those by whose labours so many scenes of enchantment had been created was great, and he hoped that debt would be in some degree repaid by their subscriptions that evening. (Cheers.)

Mr. H. J. Veitch briefly responded in appropriate terms, making a strong appeal on behalf of the Institution. He said that of late the Committee had had a very anxious time, and not very long ago it appeared doubtful as to whether they would be able to hold their anniversary gathering. But thanks to Lord Brassey and other donors they were able to do so. Regarding the aid given, the Committee would willingly increase the number of pensions were it in their power to do so. Those who had been elected as pensioners were very grateful for the sums they had received. The oldest pensioner now on the list was ninety-one years of age, and he had received assistance for nineteen years. In order to render as much assistance as possible they had kept down the working expenses of the Institution, having reduced them from 25 per cent. in 1888 to no less than 13 per cent. Still, much remained to be done. It was enough to "melt a heart of stone" to read some of the letters received. In January, 1891, eleven pensioners were elected, leaving fourteen unsuccessful ones; this year fourteen had been elected out of thirty-three candidates; and next year they expected to be only able to put eight on the list out of nearly forty applicants, unless the funds were considerably increased. He, therefore, hoped all who could would render assistance. Most of the cases were deserving of the greatest sympathy. One in particular he might mention. This was a gardener who, from the sting of a bee, had become totally blind, and he moreover had a wife and family depending on him for support. This, however, was not the only case of a blind gardener. The Committee thought some time ago that the rules of the Institution needed revision, which was being done, and he hoped it would meet the approval of all whom it concerned. The Institution had a Committee of whom it might be proud, and in Mr. G. J. Ingram, the Secretary, just the man that was wanted.

Lord Addington gave "The Royal Horticultural and Botanic Societies of London and the United Kingdom," and in doing so remarked that there was no dispute about the valuable services rendered by gardeners. Spring frosts, wireworm, and numerous other enemies had

to be battled with, but invariably gardeners were successful. Gardening, he said, had a great influence over the beauty and character of the country, and for that reason should be encouraged. There was no English landlord who did not look forward to planting, and he considered forming avenues a duty. More land, too, should be cultivated with fruit and other products, for last year we spent £2,000,000 in importations of this kind, comprising £1,000,000 in Apples and proportionate sums in Onions and Potatoes.

Sir Trevor Lawrence, Bart., in responding said he did not know where England would be if it were possible to imagine for a moment that the practical gardener were wiped out of existence. It was, therefore, the interest of such that they had to consider. He thought that the Royal Horticultural Society could claim to be the parent of all other societies. It may have made mistakes, but it had done good, and he ventured to say that in the last years of the present century the Royal Horticultural Society may fairly expect the respect and confidence of the horticultural world. In no year since 1887 had there been less than 265 Fellows elected. This year there would probably be 400 new Fellows. But having reduced the subscription the income of the Royal Horticultural Society did not increase proportionately, it now being about £3000. Out of this nearly £2000 were spent annually in maintaining Chiswick Gardens. It may be asked what did they give country subscribers in return for their subscriptions? Well, they gave them more than they generally anticipated. The copies of the Journal of the Society were disseminated widely, and he considered the report of the Conifer Conference, recently distributed, a most valuable work of reference. He thought the Royal Botanic Society did good in a particular way, and all who could ought to support the Gardeners' Royal Benevolent Institution. It was not supported so much as it should be. There was not anyone who owned a garden that did not derive pleasure from the work of his gardener. (Hear, hear.)

The Rev. W. Wilks, M.A., in proposing "The Stewards and Donors," said that all who know him was aware of the warm interest he took in gardening. He considered the English gardener inferior to none, but superior to all in the world. (Cheers.) He thought that the income of the Gardeners' Royal Benevolent Institution might be increased considerably if the Committee were to draw up a proper circular and send it round to the clergy of the kingdom, asking for offertories made at harvest festivals at least every third year. He had adopted that plan this year, and although his was a tiny parish, with but little over 600 inhabitants, he had been able to hand £30 over to the Institution.

Mr. H. E. Milner briefly responded, and said that, thanks to a hard-working Executive Committee, the promoters of the recent International Horticultural Exhibition were able to give a donation of £250 to the Gardeners' Royal Benevolent Institution. (Cheers.) He was sorry they could not give more, but there were other gardening charities to be remembered.

Mr. N. Sherwood gave "Our Chairman" in suitable terms, and Lord Brassey briefly responded.

The Secretary, Mr. G. J. Ingram, announced that the result of the evening's subscription was £1400. This included Lord Brassey 50 guineas, Messrs. Rothschild 100 guineas, Baron Schröder 30 guineas, Mr. Howard Morley £25, Sir Julian Goldsmid 20 guineas, Rev. W. Wilks 30 guineas, Mr. Watkins 26 guineas, Mr. T. Manning 10 guineas, Mr. A. Weeks 10 guineas, and numerous other smaller sums. In commemoration of their silver wedding, Mr. H. J. Veitch and Mrs. Veitch have very kindly given £250 each.

A selection of music, under the direction of Mr. Herbert Schartau, enabled those present to pass a very pleasant evening.

ACIDANTHERA BICOLOR.

WE believe it to be the first time that this Iridaceous plant has been figured in the British floricultural press. *Acidantha bicolor* was discovered in 1844, and though generally known as a Cape bulb, it has, we believe, been found as far away as Abyssinia.

The bulbs are a little more than an inch across; the foliage is similar to that of a *Gladiolus*, while the spikes grow from 2 to 3 feet high. The flowers are borne loosely at the top of the spike, and are slightly pendulous, long and tubular; the perianth is spreading at the mouth of the tube, and in colour is creamy white, with markings of chocolate or brown. As the plant produces bulblets very freely, a stock can easily be raised; it may also be propagated from seed. There is nothing difficult about the cultivation of *Acidantha bicolor*. It requires similar treatment to that accorded to those species and varieties of *Gladiolus* which are usually grown in pots for late or early flowering.

In some parts of the United States it is largely grown, as plentifully as *Ixias* are grown in the south of England. A favourite mode of culture there is to place a number of flowering bulbs into small tubs or large pots, and these, when in bloom, are used for decorating the conservatory or greenhouse. The flowers are especially fragrant during the evening, which naturally gives them an additional charm. The plants from which our illustration (fig. 60), was taken, were flowering in the Cape house at Kew during the end of September and the beginning of October, and were in bloom about three weeks.—C. K.

CHRYSANTHEMUM SHOWS.

DEVIZES.—NOVEMBER 8TH.

THIS is a very popular Show, both with exhibitors and visitors. Liberal prizes are provided for the former, while in addition to the display of Chrysanthemums of superior merit there is also a very successful bazaar held, the charities of the town being greatly benefited thereby. Mr. T. King, the Castle Gardens, is responsible for all the arrangements connected with the Chrysanthemum Show, and everything in his hands passed off very pleasantly and smoothly.

No classes for trained plants are now provided, groups being the principal feature. This year only two of these were arranged. Mr. H. Clack, gardener to Major C. E. Colston, M.P., was well first, having a grand display of bloom, the second prize going to Mr. W. Mantell, gardener to W. Brown, Esq.

For twenty-four cut blooms of incurved varieties the first prize was £10, and this was easily won by the Messrs. W. & G. Drover, who had flowers of Emily Dale (2), John Doughty (2), Lord Wolseley (2), Golden Empress of India (2), Mr. Coleman, Lord Alcester (2), Princess of Teck, Nil Desperandum, Queen of England (2), Alfred Salter, Alfred Lyne, Miss M. A. Haggas, Prince Alfred, Violet Tomlin, M. Darrier (good), Mrs. Heale, Mrs. W. Shipman, and Jeanne d'Arc. Mr. G. Inglefield, gardener to Sir J. Kelk, was a good second; and Mr. W. Neville, gardener to F. W. Flight, Esq., third. Seven competed with twelve Japanese varieties.

The first prize, a silver cup value 5 guineas, went to the Messrs. Drover, who had very fine blooms of Vivand Morel, Florence Davis, Mrs. E. W. Clarke, Edwin Molyneux, Sunflower, Mons. Bernard, Mrs. Wheeler, Middle M. Hoste, Avalanche, J. S. Dibbin, M. E. A. Carrère, and Mrs. F. Jameson. Mr. Neville was a creditable second, his stand comprising J. P. Kendall, Beauty of Castlewood, Alberic Lunden, E. D. Adams, Masterpiece, Florence Davis, and Vivand Morel. Mr. W. Robinson, gardener to Lord Justice Lopes, was third. A remarkably fine bloom of Vivand Morel in the latter's stand was selected as being the finest bloom of Japanese variety in the Show; a bloom of Lord Alcester shown by Messrs. Drover, securing a similar award in the incurved section. Mr. H. Clack was first for Anemone flowered, and Mr. W. Robinson second; the last named being first for twelve incurved varieties shown as grown with foliage.

LEEDS PAXTON.—NOVEMBER 8TH AND 9TH.

THE third Show under the auspices of the above Society was held in the Victoria Hall. The earliness of the fixture and lateness of the season told somewhat heavily on the quality of the exhibits. This was especially noticeable in the incurved and cut bloom classes.

For thirty-six blooms, not less than sixteen incurved and sixteen Japanese, distinct varieties, there were four entries. The first prize, including a challenge cup, was awarded to W. Robinson King, Esq., Nelholme, North Ferriby, Brough (gardener, Mr. Hotham). Mrs. Cope, Dove Park, Woolton, Liverpool (gardener, Mr. Thos. Carling), was second; the Earl of Harrington, Elvaston Castle, Derby (gardener, Mr. J. H. Goodacre), third; and Mrs. Roundell, Gledstone, Skipton (gardener, Mr. J. Bell), fourth. The competition was very keen in this class, and many thought Mr. Carling's flowers at least equal to the winner. Mr. Hotham staged his flowers as follows:—Incurved, back row: Mons. Bahuant, Queen of England, Alfred Salter, Jeanne d'Arc, Queen of England, and Bahuant. Middle row: White Beverley, Lord Wolseley, Beauty of Hull, Prince Alfred, Ami Hoste, and Formosum alba. Front row: Lady Harding, Mr. Bunn, Camille Flammarion, White Venus, Mrs. Dixon, and Prince of Wales. Japanese, back row: Sunflower, Vivand Morel, Stanstead White, W. W. Coles, Sunflower, and Etoile de Lyon. Middle row: Edwin Molyneux, Miss H. Whellan, W. H. Lincoln, Bouquet des Dames, Vivand Morel, and Mrs. J. Wright. Front row: Madame Clemence Audiguier, Mons. Bernard, George Daniels, Thomas Stephenson, Middle Louise Leroy, Val d'Andorre. The best incurved flowers in Mr. Carling's stand were Mons. Bahuant, Emily Dale, Ami Hoste, Madame Mante, Refulgens; and of Japanese, Middle Marie Hoste, Vivand Morel were well staged.

For twelve incurved, distinct, the first prize was awarded to Mrs. Cope; second to W. Jackson, Esq., Knottingley Hall (gardener, Mr. W. Pearson). The flowers in the leading stand were staged as follows:—Back row: Lord Alcester, Queen of England, Ami Hoste, and Mons. Bahuant. Middle row: Alfred Lyne, Mr. Bunn, Nil Desperandum, and Jeanne d'Arc. Front row: J. Salter, White Beverley, M. F. Mistral, and Madame Mante. For twelve Japanese Mr. Hotham was placed first, Mr. Jos. Bell second, and Mr. Carling third. The first prize stand contained Stanstead White, W. W. Coles, Vivand Morel, Sunflower, Ed. Molyneux, Condor, Middle Louise Leroy, Mrs. H. Whellan, Thos. Stephenson, Mrs. C. Wagstaffe, and Gloire de Rocher.

The smaller classes were well filled, and a fine feature was the class for six blooms of one incurved, Mr. Hotham winning, Mr. Pearson being second. For six Japanese Mr. Hotham was first with fine Bouquet des Dames; second, Mr. Bell, with six magnificent Molyneux.

In the gentlemen's and amateurs' class, limited to a radius of seven miles, for twenty-four blooms, not less than twelve incurved and twelve Japanese, distinct, a silver challenge cup and £5 in cash was offered. The first prize fell to Mr. T. Newbould, gardener to A. Jacobs, Esq., Craig Royd, Rawdon. Sir Jas. Kitson, Bart., M.P. Gledhow (gardener, Mr. W. Grix), was placed second; third, Mr. J. Gordon, Esholt House, Woodlesford.

The classes for black and white Grapes were well filled with good

examples. Mr. Newbould won in both classes with Alicante and Muscat of Alexandria. The schedule included classes for vegetables, and brought forward a good competition. The principal prizewinners were W. Atkinson, Esq., Headingley, H. P. Bowering, Esq., and Sir Jas. Kitson, Bart.

Miscellaneous groups of plants arranged for effect were an attractive feature. The prizes fell to Mr. Sunley, nurseryman, Milford Junction, first; E. B. Faber, Esq., Stray Lea, Harrogate (gardener, Mr. W. Townhend second; and A. T. Lawson, Esq., J.P., Weetwood, (gardener, Mr. E. Morris) third.

Groups of Chrysanthemums arranged for effect were best shown by H. P. Bowering, Esq. (gardener, Mr. W. Moore) first; Mrs. Tetley, Fox Hill, Weetwood (gardener, Mr. J. Eastwood), second; and Mrs. Heaton, Clarendon, Leeds (gardener, Mr. G. Buck), third.

CHUDLEIGH.—NOVEMBER 8TH.

THE annual autumn Exhibition was held in the Town Hall on the date named, and although not remarkable for extent was for the quality of the exhibits.

Cut blooms of Chrysanthemums were the principal feature. The leading class was for thirty-six, half incurved, half Japanese, not less than twenty-four varieties. Four competed, the best coming from Mr. J. Stiles, gardener to Miss Fripp, The Grove, Teignmouth. Mr. Foster, gardener to H. Hammond Foster, Esq., Glendanaugh, Teignmouth, was second. Mr. H. Veale, gardener to the Rev. Sims, Newton Abbott, third, all staging creditably. For twelve Japanese Mr. Foster won easily; second Mr. Stiles. Mr. Abraham, gardener to Lord Clifford, Ugbrooke Park, Chudleigh, won the premier award for six Japanese, any one white variety, with full and fresh blooms of Avalanche. Mr. Stiles with the same variety was second. For six yellow Mr. Abraham repeated his previous success, staging grand blooms of W. H. Lincoln. Mr. Foster won first prize in the class for six any other colour with Vivian Morel. Mr. Stiles was second. Incurved blooms were best shown by the last-named exhibitor in twelve varieties, Mr. Foster following. The best Anemone blooms were staged by Mr. Foster.

In the classes devoted to the Chudleigh district, Mr. Abrahams won the premier awards for twelve Japanese, six Japanese, and six any one colour, with E. Molyneux, and for nine incurved distinct, also for six any one colour, with Princess of Wales.

The best group of Chrysanthemums was that from Mr. C. Shinner, gardener to Mrs. Bower Scott, Chudleigh—a creditable arrangement. In the miscellaneous group class Mr. Abraham was decidedly ahead of all others with an arrangement showing much taste. Mr. Blackmore, gardener to the Rev. Ford, Ideford, was second.

Mr. Foster gained first honour for the premier Japanese with Vivian Morel, and Mr. Stiles with Violet Tomlin in the incurved section.

Vegetables were, on the whole, most meritorious, the best collection coming from Mr. Abraham.

HORSHAM.—NOVEMBER 8TH AND 9TH.

THE third annual Exhibition was held at the Drill Hall on the above dates, and taken altogether it was a decided advance on that of last year.

The groups, of which five were exhibited, were exceedingly well done, and the judges, after a careful scrutiny, finally gave the premier award to Mr. S. Charman, gardener to Alfred Agate, Esq.; Mr. R. White, gardener to H. Padwick, Esq., being a very close second. Messrs. T. Vickress, W. Lintott, and W. Cattley followed in the order named.

The chief class for twenty-four Japanese, distinct, brought three competitors. Mr. T. Glen, Worth Park, was first with magnificent examples of the following: Coronet, Stanstead White, Sunflower, M. Bernard, Edwin Molyneux, Etoile de Lyon, W. H. Lincoln, Vivian Morel, Stanstead Surprise, Mrs. F. Jameson, W. Tricker, Sec. Gen. Cassagneau, Puritan, C. W. Wheeler, Avalanche, Florence Davis, Miss A. Hartzhorn, Alberic Lunden, Mdle. Lacroix, Vice-President Audiguier, Gloriosum, John Dyer, Val d'Andorre, and Louis Boehmer. Mr. Duncan, Warnham Court, was a good second; and Mr. Grace, Steyning, third. In the corresponding class for twenty-four incurved, not less than eighteen varieties, Mr. G. Goldsmith, gardener to Sir E. Loder, was first with fine deep solid blooms of Golden Empress (2), Queen of England (2), Lord Alcester (2), Empress of India (2), John Doughty (2), John Lambert, Empress Eugénie, Mrs. Shipman, Prince Alfred, Princess Beatrice, Alfred Lyne, Mrs. Heale, Miss M. A. Haggas, Barbara, Lord Wolseley, Mons. R. Bakuant, and Camille Flammarion. Mr. T. Sparkes, Wimblehurst, was a close second. Mr. Duncan was third. There were four entries in this class.

For twelve Japs, distinct, Mr. J. Pullen was first, Mr. F. Lane second, and Mr. E. Lawrence third.

For twelve incurved Mr. E. Lawrence was first, and Mr. J. Pullen second. Six Japs, Mr. T. Glen first, and Mr. G. Duncan second, Mr. F. Lane third. Messrs. Sparks, Glen, and Lawrence took the prizes for reflexed varieties, and Messrs. Pullen, Sparks, and Glen for Anemones in the order named. For six Japs, one variety, Mr. T. Glen was first with Avalanche; Mr. Pullen second with Avalanche; and Mr. Duncan third, with Ralph Brocklebank.

Trained plants were especially good. Mr. White beat Mr. Sparkes for four, the order being reversed for a single specimen, also for Pompons.

Fruit and vegetables were exceedingly good. The prizetakers for excellent Grapes were Messrs. Glen Kemp, Harris, and Le Pelley, and

for Apples and Pears Messrs. Goldsmith, Glen and Duncan. Messrs. Sutton's prizes for a collection of six varieties of vegetables brought

FIG. 60.—ACIDANTHERA BICOLOR.

seven fine exhibits, the awards being won by Messrs. T. Sparkes, G. Goldsmith, and H. Harris.

BIRMINGHAM.—NOVEMBER 8TH, 9TH, AND 10TH.

THE thirty-second annual Exhibition was held on the above dates, three days having been determined upon in the hope of raising a substantial sum for the General Hospital Building Fund.

Groups were well represented. Mr. Dyer, gardener to Mrs. Marigold, Edgbaston, was first in the class for large groups, but was closely followed by Mr. E. Jenkins, Oulton, as second, and others in rotation. Smaller groups were also set up, prettily arranged with foliage plants and Ferns. The specimen plants are always good at Birmingham, but this year they would have been all the better for a few more days. Mr. Waldron, gardener to George Cadbury, Esq., Selly Oak, was first for nine and six specimens respectively, and in other classes. Mr. Dyer also showed well.

The cut blooms were not so numerous as usual, but there was a decided gain in the quality and colour of the flowers. Mr. R. Parker of Impney was again the champion exhibitor, and also carried off the silver medal for excellence of culture in his twenty-four Japanese blooms especially. His first prize twenty-four incurved were John Doughty, Empress of India, Alfred Salter, Golden Empress, John Lambert, M. H. Bahuant, Queen of England, Lord Alcester, Mrs. Robinson King (a superb deep yellow), Princess of Wales, Mrs. Heale, Violet Tomlin, Princess of Teck, Mrs. Colman, Miss Haggas, Lord Wolsley, Alfred Lyne, Mrs. N. Davis, Lord Hardinge, Mrs. Shipman, Charles Gibson, Lord Eversley, Hero of Stoke Newington, and Jeanne d'Arc. Mr. Coombs, The Gardens, Hanley, was second; Mr. G. Bremmell, gardener to W. France Hayhurst, Esq., Wellington, third; and Mr. Morris, gardener to Sir Richard Moon, Bart., Coventry, fourth.

There were nine good exhibits in the class for twenty-four Japanese, and Mr. Parker was again first with very fine blooms of Madame C. Audiguier, W. W. Coles, Sunflower, Vivand Morel, Stanstead White, Gloire de Roher, Boule d'Or, W. Tricker, Mohawk, Mdle. Marie Hoste, E. Molyneux, Ralph Brocklebank, Alberic Lunden, Golden Dragon, Florence Davis, Puritan, Avalanche, Mrs. F. Jameson, W. H. Lincoln, Baron de Prailly, Meg Merrilies, W. Woodcock, Thunberg, Mr. S. Henry; H. W. F. Hayhurst, Esq., was second; Mr. Coombs, third; Mr. Goodson, Elvaston, fourth. For eighteen Japanese Mr. Parker was again first with E. H. Beckett, R. H. Neve, and duplicates of others in his twenty-four. Mr. C. Crook, gardener to the Dowager Lady Hindlip, Droitwich, was second. Mr. Crook was first for twelve Japanese with Etoile de Lyon, Stanstead White, E. Molyneux, Florence Davis, W. H. Lincoln, Baron de Prailly, Avalanche, Vivand Morel, W. W. Coles, Sunflower, Gloire de Roher, and Puritan. Mr. Hayhurst was second, and the Rev. W. D. Thatcher third. For twelve incurved the Earl of Denbigh was first. The various other classes were also well filled.

Primulas made an excellent display. In the open classes for twelve plants, Messrs. Pope & Sons, nurserymen, were first; and Messrs. Thomson & Co. second; whilst in the class for six plants the positions were reversed. In the class for six doubles, Mr. F. Denning, florist, was first with fine plants with very fine blooms; Messrs. Thomson, second; and Messrs. Pope & Sons, third. Stove and greenhouse plants were well staged, also a small group of Orchids from the Right Hon. J. Chamberlain, M.P.

Fruit is always a feature here; but on this occasion there was not so large a display as usual. Some excellent Grapes were staged. For six bunches of Grapes, Mr. Goodacre was first; Mr. Hollingsworth, gardener to J. F. Campbell, Esq., Uttoxeter second; Mr. Slade, Clumber, third. For three bunches of black Grapes, Mr. Bates, gardener to J. T. Harris, Esq., Stone, was first with Gros Colman. Mr. Waldron, gardener to G. Cadbury, Esq., was second. For three bunches of Muscats, Mr. Harman, gardener to the Earl of Denbigh, was first, Mr. Slade second, and Mr. Goodacre third. There were also other classes for Grapes. Mr. Slade was first for Pine Apples; he also staged not for competition four superb fruits of Charlotte Rothschild and Smooth-leaved Cayenne, for which a silver medal was awarded. Apples were best shown by Mr. Harman and Mr. Goodacre; and Pears by Mr. Parker and Mr. St. Vincent Ames.

Vegetables were excellent. Messrs. Thomson & Co. offered liberal prizes, and there was a large number of entries; Mr. Smeetham, Shrewsbury, was first with a very fine collection. Mr. Robert Sydenham also offered good prizes, and here again was a good display. Mr. Smeetham secured the first prize, which included a gold medal. Messrs. Sutton and Sons gave liberal prizes for collections, as also did Messrs. Webb and Sons. Mr. Smeetham was first in both classes. His productions were of first-class quality.

Messrs. Thomson & Co. staged a fine display of vegetables, a large group of plants, and obtained certificates for two handsome new Chinese Primulas—Princess May and Duke of York. Messrs. Dicksons (Limited) showed their new Fern—*Adiantum capillus-Veneris* imbricatum; Mr. Watkins, Hereford, a fine collection of Apples; Messrs. Pope & Son, a splendid memorial design and group of plants; Mr. Denning, a group of plants; Messrs. Hewitt & Co., a fine lot of Begonias; and Mr. Sands, Harborne, an interesting group of alpine plants.

A certificate of merit was awarded to Mr. Godfrey, Exmouth, for three blooms of his Beauty of Exmouth Chrysanthemum. Mr. Robert Owen, Maidenhead, sent blooms of some of his new varieties and seedlings on the second day, too late for the Judges.

TORQUAY.—NOVEMBER 9TH.

THE annual Exhibition of the Torquay Horticultural Society was held as usual in the Bath Saloons, and in every way proved a success. Cut blooms were the most important feature, these being staged in large

numbers and of good quality. The principal class was for thirty-six varieties, half Japanese and the remainder incurved, for which a silver cup was offered as first prize. Mr. J. Stiles, gardener to Miss Fripp, The Grove, Teignmouth, was a good first with a heavy stand of Japanese and medium-sized but neatly finished incurved. The varieties were—Japanese: Vivand Morel, W. H. Lincoln, Avalanche, Etoile de Lyon, Stanstead White, Madame J. Laing, Florence Davis, Edwin Molyneux, Puritan, Condor, Sarah Owen, Pelican, M. Bernard, Madame Bacco, W. W. Coles, Belle Paule, A. H. Neve, and Gloire de Roher. Incurved: Violet Tomlin, Empress of India, Miss Haggas, Jeanne d'Arc, Lord Wolsley, Princess of Wales, Golden Empress, Alfred Salter, Mrs. Heales, Prince Alfred, Matthew Russell, Lady Hardinge, Queen of England, M. R. Bahuant, Golden Queen of England, R. fulgens, Baron Beust, and Lady Dorothy. Mr. G. Foster, gardener to H. Hammond Spencer, Esq., Glendanaugh, Teignmouth, was second with good Japanese blooms, but smaller incurved, all well staged. Mr. F. Prothero, gardener to W. McKenzie Bradley, Esq., The Elms, Exmouth, was third. The best twelve incurved were staged by Mr. Stiles, a neat stand. Mr. H. Vcale, gardener to the Rev. A. H. Simms, Wolborough Rectory, was second.

Japanese in twelve varieties made a good display, Mr. Foster winning after a close fight with Messrs. Beachey & Co., Kingskerswell. So good were the first prize stand of blooms that we give their names. Etoile de Lyon, Mrs. F. Jameson, W. Tricker, E. Molyneux, Stanstead White, Vivand Morel, Gloire de Roher, Florence Davis, Puritan, Wm. Lane, Sarah Owen, and Eynsford White. Mr. J. Stiles was third.

Six reflexed, distinct, were best staged by Mr. Stiles. Mr. F. Prothero staged the best six Anemones, and very fine they were. Such sorts as Delaware, Miss Annie Lowe, and Grand Alvele were well represented. Messrs. H. Veale and Foster were second and third. Mr. Satterly, gardener to Mrs. Matthews, Braddon Villa, Torquay, was an easy first for six Anemones, one variety, with Mrs. Judge Benedict fully developed. Mr. Prothero was second with Lady Margaret. Mr. Satterly won the premier honour for six of any one reflexed kind with Cullingfordi. Mr. Foster was again successful in the class for six Japanese, any one sort, with grand specimens of Eynsford White, Mr. Stiles following with Avalanche. Mr. A. Searle, gardener to Miss Boyd, Gnaton, Torquay, was first with six yellows of one variety, with richly coloured W. H. Lincoln. Messrs. Beachey staged medium sized but fully developed blooms of W. Tricker in the class for any other coloured Japanese. Mr. F. Ferris, gardener to J. W. Kimber, Esq., Tracey, Cockington, won with twelve Avalanche in a class for any variety.

Groups of Chrysanthemums were well shown. For one in a circle of 7 feet diameter, to contain not less than eighteen varieties, Mr. S. Casely, gardener to Miss Croydon, Heathfield, Torquay, was first with grandly grown plants, effectively arranged. Mr. Satterly was second; and Mr. C. Alder, gardener to W. B. Fortescue, Esq., Oton, Torquay, third. Groups of miscellaneous plants were also well shown by Mr. Satterly and Mr. J. Slowman, gardener to Captain Fane Tucker, Braddon Villa, Torquay.

Messrs. R. Veitch & Sons, Exeter, had a grand collection of fifty dishes of Apples not for competition, and Messrs. Curtis & Sandford a good group of Chrysanthemums, which added considerably to the attractiveness of the Exhibition.

CIRENCESTER.—NOVEMBER 9TH.

THE second Exhibition of this Society was a distinct improvement on that held last year, and was in every respect a great success. All the arrangements were admirably carried out by the Honorary Secretary, Mr. H. Frank Sare, and an efficient Committee.

Groups of Chrysanthemums, and with which it was stipulated should be arranged a variety of fine-foliaged plants and Ferns, were quite the feature of the Show. Unfortunately nothing was mentioned as to effect being a strong point, or the decisions of the judges might have been altered somewhat. Mr. T. Arnold, gardener to Earl Bathurst, was first, he having really excellent Chrysanthemums, but stiffly arranged, a fine Kentia in the centre and other foliaged plants not offering sufficient relief. Mr. D. Ekins, gardener to A. Cator, Esq., was second, the third prize going to Mr. H. R. Saunders, gardener to J. Taylor, Esq. Very good also were the smaller groups, and in this instance Mr. T. Painter, gardener to C. Green, Esq., was well first. Mr. W. Larnier, gardener to J. Hyde, Esq., was a good second, and Mr. H. Duffin, gardener to H. Van Notten Pole, Esq., third.

Trained plants were not numerous. The best six were shown by Mr. J. Bastin, gardener to Mrs. G. Holloway, Slough. Mr. O. Orpet, gardener to the Misses Brown, was a good second. The last named was well first for three incurved varieties, and second for a like number of Japanese sorts, the first prize in the last-named class being awarded to Mr. C. Smith, gardener to E. J. Evans, Esq. The first prize for the best specimen plant also carried with it the silver medal of the National Chrysanthemum Society, and this was won by Mr. O. Orpet, who showed a well-flowered plant of La Triomphante. Mr. H. S. Saunders was second, and Mr. W. Taylor, gardener to T. W. C. Master, Esq., third.

Cut blooms were largely shown, but not a few of them gave signs of being too late for the show. The best thirty-six blooms, to consist of equal numbers of incurved and Japanese varieties, were shown by Mr. C. Mayo, gardener to A. Apperley, Esq., Stroud, who had incurved John Doughty, Empress of India, Princess of Wales, Lord Alcester, Lord Wolsley, John Salter, Golden Empress, Camille Flammarion (rough and ugly), Queen of England, Mrs. Coleman, Jeanne d'Arc, Mabel Ward, Madame Parrier, Jardin des Plantes, Alfred Salter, and Princess of Teck; Japanese Sunflower, Vivand Morel, Stanstead White, Edwin Molyneux, Pelican, Etoile de Lyon, Madame C. Audiguier,

Avalanche, Countess Beauregarde, Mdle. M. Hoste, Stanstead Surprise, Golden Dragon, Maiden's Blush, Thunberg, Puritan, Mr. H. Cannell, Florence Davis, and Mons. J. A. Laing, all, with one exception named, in good condition. Mr. R. Fawkes, gardener to C. Hooper, Esq., was second. In the local class for twenty-four blooms, equal number of incurved and Japanese varieties, Messrs. D. Elkins and G. Price were equal first, both having very even creditable stands, the third prize going to Mr. C. Smith, gardener to Mrs. Evans. Mr. G. Price was first for twelve incurved, his best being Lord Alcester, Queen of England, Prince Alfred, Mrs. Shipman, and Princess of Wales.

With twelve Japanese varieties Mr. G. Price was well first, having among others good blooms of Sunflower, Edwin Molyneux, Avalanche, Val d'Andorre, and Madame C. Audiguier. Mr. D. Elkins was second, and Mr. Bignell third. The competition with six blooms was very close and good. Mr. W. Taylor was first, and Mr. F. Esell, gardener to E. A. Leatham, Esq., second. Very fine also were the stands of one variety. Mr. G. Price was first with E. Molyneux, Mr. D. Elkins second with Vivian Morel, and Mr. Bignell third with Sunflower. Mr. Elkins was the most successful exhibitor in the classes for reflexed, Anemone flowered, and Pompons.

Great interest was taken in the classes for vases, baskets of flowers, and autumn foliage and berries, in which ladies successfully competed. Grapes, Apples, and Pears were also well and extensively shown.

HORNSEY.—NOVEMBER 9TH AND 10TH.

THE members of the Hornsey and District Chrysanthemum Society have just cause to be proud of their third annual Exhibition, which was held in the National Hall on the above dates. It was the best and most effectively arranged local Show we have seen this season. The cut flowers, moreover, could compare favourably with those staged at many larger exhibitions, and the same may be said of the groups.

The principal class was for twenty-four incurved blooms in not less than eighteen varieties, and the premier award was secured by Mr. E. Rowbottom, gardener to H. R. Williams, Esq., The Priory, Hornsey. The flowers in this stand were superb. Among other varieties staged, Empress of India, Golden Empress, Queen of England, Lord Alcester, A. Salter, Madame Darrier (very fine), and Mr. Brunlees were most conspicuous. Mr. J. L. Turk, gardener to E. Boney, Esq., Highgate, was first with twelve incurved, showing neat and well developed blooms. Mr. Rowbottom was first with six incurved varieties, distinct, showing Barbara, John Lambert, Empress of India, Alfred Salter, Golden Empress, and Princess of Wales in splendid condition. For six incurved blooms of one variety Mr. Rowbottom was again first with a splendid stand of Golden Empress.

Japanese varieties were really magnificent. In the class for twenty-four blooms Mr. Rowbottom secured the first prize with splendidly grown flowers. We have never seen better at a local show. The varieties staged were Golden Empress, Gloire de Rocher, Etoile de Lyon, Beauty of Castlewood, Miss Marian Throver (good), Alberic Lunden, Florence Davis, W. Tricker, Boule d'Or, E. Molyneux, Mdle. Marie Hoste (grand), Mdle. Eugénie Mulson, Vivian Morel, Puritan, Lord Brooke, J. Stanborough Dibben, Hamlet, Col. B. Smith, Miss Lily Measures, Felix Cassagneau, Mohawk, Condor, and Coronet. Mr. J. Brookes, gardener to W. Reynolds, Esq., The Grove, Highgate, was second. Mr. Northover, an amateur grower, secured the first prize for twelve Japanese in the open class with a creditable exhibit. Mr. J. L. Turk was second. The best six Japanese blooms of one variety were shown by Mr. Rowbottom, who had superb examples of Mdle. Marie Hoste. One bloom of this was of gigantic proportions and perfect symmetry, justly meriting the certificate awarded for it. Mr. Brookes was second with Avalanche. Pompons were likewise well shown by Mr. Rowbottom, and amongst others we noticed grand blooms of Harry Hicks, a new variety of a rose pink colour with gold tips. Mr. J. L. Turk was second in this class. Mr. Rowbottom also had the best large flowering Anemones, which included Deleware in first-rate condition.

Groups made a charming display, they being arranged on each side of the hall. Mr. Rowbottom was first in the open class with well-grown plants carrying magnificent blooms most effectively arranged. Mr. N. Neary, gardener to the Rev. W. Powell, Holy Innocents, Hornsey, was second with an excellent group. The groups in the amateur classes were also first-rate, and the same may be said of the cut blooms. Trained plants were best shown by Messrs. Brookes and Neary.

Mr. C. W. Cousins, High Street, Wood Green, sent a group of miscellaneous plants. Primulas and Zonal Pelargoniums were also well represented, and the bouquets and table decorations made an imposing display.

Fruit was well represented, some excellent Grapes, Pears, and Apples being staged by Messrs. Rowbottom, Cowland, W. Wilkinson, A. Heale, W. Ward, and G. Amos.

BATH.—NOVEMBER 9TH AND 10TH.

ALTHOUGH in many respects a very excellent Show, there was a marked falling off in the number and quality of trained plants. The best four specimens of large flowered varieties were shown by Mr. C. Trimby, gardener to Miss Maitland, Mr. R. B. Cater being a close second. With four Japanese varieties Mr. J. Southard, gardener to W. J. Brown, Esq., was first, the second prize going to Mr. W. Davis, gardener to Dr. Budd, and the third to Mr. R. B. Cater. For three standards Mr. C. Trimby was well first, having Roseum superbum, Mrs. Rundle, and Mdle. Lacroix in good condition. For a single specimen the judges had no difficulty in awarding the first prize and also the silver

medal of N.C.S. to Mr. S. Kerslake, gardener to the Rev. E. Handley, who exhibited a magnificent plant of Mrs. Rundle, 6 feet through, and carrying about 200 very good blooms. Mr. T. J. Tate, gardener to W. Pumphrey, Esq., was second, and Mr. J. Southard third. Mr. R. B. Cater had the best pyramid. Banks of Chrysanthemums were never better at Bath, and are seldom surpassed anywhere. Mr. S. Kerslake was first, his plants being good as regards foliage and blooms. Mr. W. Davis was second, and Mr. J. Southard third.

Miscellaneous plants are always of superior quality at these Shows, and were fully up to the usual standard on this occasion. The best group was arranged by Mr. Tate, Messrs. Cole & Sons being the most successful with fine-foliage plants, while for Primulas the prizes were well won by Messrs. C. Fisher, J. Ward, Jerome Murch, and E. Hall. Mr. W. Fidler, gardener to Baron C. de Tuyl, Chipping Sodbury, was well first for Poinsettias. Mr. J. T. Holmes was first for three Orchids.

Cut blooms were largely shown. The first prize for twenty-four Japanese varieties went to Mr. P. Mann, gardener to W. H. Laverton, Esq., who had large blooms of R. Brocklebank, Mrs. Wheeler, A. H. Neve, W. G. Drover, Alberic Lunden, W. H. Lincoln, Carew Underwood, Sunflower, Mons. G. C. Schwabe, Etoile de Lyon, E. Molyneux, F. Davis, Boule d'Or, Stanstead White, Coronet, Baron de Prailly, W. W. Coles, Exeelsior, Condor, Fimbriatum, Mrs. F. Jameson, Kioto, E. Lonsdale, and Madame Baco. Some of the blooms in this stand were past their best. Mr. W. Iggulden, gardener to the Earl of Cork, was second for a stand of fresh blooms, the best among which were Vivian Morel, Mrs. Jameson, W. H. Lincoln, W. Tricker, Mr. J. Clark, and G. Daniels. Mr. W. Robinson, gardener to Lord Justice Lopes, was a good third, the Vivian Morel in his stand being selected for the award of a silver medal offered for the finest bloom in the Show. Five others competed. The class for twelve Japanese varieties was also well filled, and with these Mr. Holbrook, gardener to Mrs. Beddoes, was first, some of his best being G. Daniels, Vivian Morel, W. Lane, W. H. Lincoln, Stanstead White, and Mdle. Marie Hoste. Mr. Robinson was second. Mr. J. A. Martin was first for six blooms, and Mr. J. D. Willis second. The first prize for six new varieties was awarded to Mr. Robinson, who had Vivian Morel, W. K. Woodecock, Florence Davis, Gloire de Rocher, Marie Hoste, and E. W. Clark in good condition.

The large flowered varieties were not first class. The first prize for twenty-four blooms was won by Mr. Robinson, who had medium sized neat blooms of Mrs. Forsyth, Golden Empress, Jeanne d'Arc, Beauty, Cullingfordi, John Salter, Empress Eugénie, Mrs. N. Davis, Golden Queen of England, Ami Hoste, J. Doughty, Queen of England, Princess of Teck, Golden Christine, Lord Wolseley, Miss Haggas, Venus, Robert Cannell, Violet Tomlin, and Cherub. Mr. John Baylis was second, and also first for twelve varieties in which class Mr. Robinson was second. Mr. Robinson was the only exhibitor of Anemone flowered varieties, and was awarded the first prize. Grapes were superbly shown. Mr. W. Taylor, gardener to Alderman Chaffin; Mr. W. Nash, gardener to the Duke of Beaufort; Mr. G. Pymm, gardener to Mrs. Gould-Smith, and Mr. T. Jones, Bath, took the leading prizes. Mr. W. Nash was first, as usual, with a collection of fruit, Mr. Pymm being second. Pears were very well shown, the most successful exhibitors being Messrs. Dunn, J. Lloyd, gardener to Vincent Stuckey, Esq., J. Jones, and W. Nash. Apples were exceptionally numerous and well shown, the colour throughout being remarkably good. Messrs. Evry, Dunn, Fisher, Hooper, and G. Garraway were the leading prize-winners.

SOUTH SHIELDS AND NORTHERN COUNTIES.

NOVEMBER 9TH AND 10TH.

THE above Show was held in the Royal Assembly Hall, South Shields, and was not so satisfactory to the promoters as they deserved. To popularise their Show the Committee increased the prizes by £10 this year, and, not to clash with the other great northern Show, held it a fortnight earlier. This seems to have been their only mistake. The entries were short of last year, but the quality of the exhibits in most cases were superior.

Incurved blooms were most conspicuous by their absence, but the Japanese were better than any ever shown at South Shields.

For thirty-six Japanese, eighteen varieties, Mr. Peter Blair, Trentham, was a good first. The blooms were large, fully developed, and well coloured. The best blooms were Alba, Gloire du Rocher, George Daniels, Coronet, Vivian Morel, Sunflower, Mdle. Marie Hoste, Avalanche, G. C. Schwabe (fine), Fimbriatum, Bouquet des Dames, Etoile de Lyon, Miss Oswald, Louis Boehmer, Madame Laing, Richard Nesbit, Sunflower, Stanstead White, and M. F. Spalding. Mr. Thos. Wheeler, gardener to C. Mitchell, Esq., Jesmond Towers, Newcastle, was second with smaller flowers, but good. The best blooms were Vivian Morel, W. G. Clark, Condor, E. Molyneux, Stanstead Surprise, La Triomphante, and Mrs. F. Jameson. Mr. Geo. Smith, Hull, was third.

For eighteen Japanese Mr. Blair was also first. They were equal if not better than the stand of thirty-six. The best blooms were Vivian Morel, Coronet, Avalanche, Gloire de Rocher, G. Daniels, Sarah Owen, Sunflower, Louis Boehmer, Etoile de Lyon, Avalanche, Madame Laing, Stanstead White, W. H. Lincoln, and Mons. Wm. Holmes. Mr. Geo. Walker, gardener to J. White, Esq., Cedars, Low Fell, was second; and Mr. D. P. Bell, Clive House, Alnwick, was third. For twelve Japanese, Mr. Thos. Wheeler was first; his stand included good flowers of Vivian Morel, Etoile de Lyon, and Edwin Beckett. Only one stand of incurved was staged by Mr. Thos. Wheeler, this being awarded second prize.

For twelve bunches of Pompons Mr. Geo. Smith was first, and for

twelve Anemone-flowered Chrysanthemums Mr. P. Blair was first, very large fine shaped flowers, and in addition was awarded the certificate of the National Chrysanthemum Society. The varieties included Gladys Spalding, Tubal d'Argent, M. Judge Benedict, Prince of Anemones, Superb, and Solare de Soleil.

Mr. W. J. Godfrey, of Exmouth, staged blooms of Beauty of Exmouth, for which the judges awarded a special certificate of merit.

Hand bouquets and epergnes were really good. Mr. Peter Blair was first for a bouquet, including a neat assortment of good flowers tastefully arranged. Mr. Wm. East was first for the bridal bouquet, containing the usual white flowers. For a drawing-room epergne and Chrysanthemum epergne, Mr. Geo. Webster, the Market, Sunderland, was first in each class. For ladies' sprays Messrs. R. Gibson & Son, Sunderland, were first in two classes. Twelve buttonhole bouquets were best staged by Mr. Thomas Battensby, Blaydon.

Fine groups of Chrysanthemums and other foliage plants were staged. Mr. Charles Burton, Middlesborough, was first. The Chrysanthemums were good, the individual flowers being large, and the base was well toned with fine coloured Crotons and Dracenas. The judges also awarded the National Chrysanthemum Society's certificate to this group.

Specimen plants, although hitherto shown at this Exhibition in good form, were deficient, owing to the lateness of the season. Table plants were fine. Mr. Thos. Wheeler was adjudicated first.

Ten dishes of black Grapes were staged, and Mr. J. Wood, gardener to E. Hopper, Esq., Riverside, Morpeth, secured the first prize and a silver medal with finely finished Black Alicante bunches; Mr. D. J. Bell was second with Alnwick Seedling; and Mr. Jas. Witherspoon, Chester-le-Street, third. Mr. Jas. McDonald was first with white Grapes with Muscat of Alexandria. Four lots were staged. A word of praise is also due to the staging Committee, Messrs. Wood and Robson, for making the best of the exhibits at their disposal, and there is no doubt that in future this Exhibition will increase in importance and excellence of exhibits.

MARKET HARBOROUGH AND DISTRICT.—NOV. 9TH AND 10TH.

THE seventh annual Show of this Society was held in the Corn Exchange, Market Harborough, on the above dates, and proved a very meritorious and attractive display.

The first prize for thirty-six cut blooms, eighteen Japanese, distinct, and eighteen incurved, not less than twelve varieties, was won by Mr. Dunkley, gardener to S. Symington, Esq., Market Harborough, with very fine flowers. The varieties were—Japanese: Vivian Morel, Stanstead White, Edwin Lonsdale, Gloire du Rocher, Etoile de Lyon, Sunflower, R. Brocklebank, W. Tricker, Boule d'Or, Mrs. J. Wright, Criterion, Madame C. Audiguier, Belle Paule, Wm. Lane, Avalanche, Mons. Bernard, Madame J. Laing, and Miss A. Hartzhorn. Incurved: Empress of India (2), Golden Queen (2), Lord Alcester (2), Queen of England (2), J. Doughty, Golden Empress, Lord Wolseley, Alfred Salter, Violet Tomlin, John Salter, Princess of Wales, Prince Alfred, Jeanne d'Arc, and Hero of Stoke Newington. Mr. Wm. Duncan, gardener to Lady Lisgar, was second; and Mr. Geo. Mackinlay, gardener to Sir Chas. Isham, Bart., third.

For twelve incurves Mr. Dunkley was first and Mr. Wm. Duncan second, and for twelve Japs the same exhibitors were placed equal.

Several excellent groups were arranged. One comprising Chrysanthemums interspersed with foliage plants was very fine indeed, and was greatly admired. The exhibitor of this was Mr. Wm. Duncan. For a group of Chrysanthemums arranged for effect Messrs. Plowman & Son, Market Harborough, were first.

The classes for plants of Chrysanthemums were not very keenly contested. Mr. H. Dunkley showed a James Salter, very finely flowered, and Mr. C. Bushell had Val d'Andorre. The same exhibitors were also placed first in each of the classes for single specimens of reflexed, Pompon and incurved varieties. Mr. J. Battam also showed good specimens, including a very fine plant of Mons. Wm. Holmes.

BARNESLEY.—NOVEMBER 9TH AND 10TH.

THIS Exhibition was held on the above dates, and was a decided improvement on those of previous years. The chief prizes were awarded as follows:—For twenty-four varieties, twelve incurved and twelve Japanese, distinct, R. Brocklebank, Esq. (gardener, Mr. Jas. Vaughan), The Hollies, Woolton, Liverpool, secured first honours with a fine even stand of blooms. The varieties shown were, incurved: Queen of England, Mons. R. H. Bahuant, Emily Dale, Lord Alcester (2), Golden Empress, Empress of India, Alfred Salter, Princess of Wales, Violet Tomlin, J. Salter, and Lord Wolseley. Japanese: Vivian Morel, Stanstead White, Sunflower, Mons. Bernard, E. Molyneux, Gloire de Rocher, Belle Paule, W. H. Lincoln, Mdle. M. Hoste, Avalanche, Florence Davis, and W. W. Coles. Mrs. Jones, Elmsal Lodge (gardener, Mr. Dunn), was a good second; and A. Alderman, Esq., was third.

For twelve reflexed Lord Halifax (gardener, Mr. Wainman) was placed first; and C. H. Simpson, Esq. (gardener, Mr. Thos. Ketcheld), second. For twelve large-flowering Anemones, not less than six varieties, Mr. J. Vaughan was first; Mr. Thos. Ketcheld second; Mr. Wainman third. For a hand bouquet of Chrysanthemums Mr. Jas. Vaughan was first; Mr. J. Austin, Stancross, second; and Mr. R. Creighton, Hemsworth, third.

For twenty-four cut blooms, twelve incurved, twelve Japs, open to district exhibitors, the first prize £3 and silver challenge cup, offered by A. K. Kells, Esq., one of the Vice-Presidents of the Society, was won for the second year in succession, and thus becomes his absolute property, by

G. J. Burnley, Esq., Birthwaite Hall, Darton (gardener, Mr. A. Popplewell). Mr. C. Fevers, a local amateur, ran him a very close second; Mr. T. Goodyear being third.

In the fruit classes Colonel Stanhope, Cannon Hall (gardener, Mr. E. Clarke), was first for two bunches of black Grapes, Gros Colman; Mr. Ketchell was second; and A. Wilson, Esq., Tranby Croft, Hessle (gardener, J. P. Leadbetter), third. For white Grapes, Mr. Leadbetter was first; Mr. Ketchell second; and Mr. Clarke third.

WESTON-SUPER-MARE.—NOVEMBER 10TH.

THIS Exhibition was undoubtedly the best held in the neighbourhood. Mr. W. H. Vanes is the efficient Honorary Secretary, and the Committee comprises amateurs as well as working gardeners.

Specimen plants were the feature of this display. The first prize for six large flowering varieties was awarded to Mr. W. Daffurn, gardener to Donal Cox, Esq., who had moderately large neatly trained specimens carrying good foliage and blooms. Mr. C. Holland, gardener to W. Ash, Esq., was a good second, and Mr. W. Brooks third; the latter's plants not being quite forward enough. For four varieties, Mr. G. Sutton, gardener to W. A. Todd, Esq., was an easy first, Mr. G. Lambert being second, and Mr. A. J. Young third. With six specimens of Japanese varieties Mr. Holland was well first, having globular trained plants about 5 feet through, and beautifully flowered. Mr. W. Brooks was a close second, and Mr. Daffurn third. With four varieties Messrs. G. Sutton, G. Lambert, and J. Young won the prizes in the order named. Mr. Daffurn was first with specimen Pompons; Mr. Holland a close second, and Mr. Brookes third. Mr. Daffurn had the best standards, followed by Mr. Holland. The specimen selected as being the best in the Show was a very finely flowered plant of Mrs. Glenney shown by Mr. W. Brooks. Groups of Chrysanthemums were fairly good, and slightly better than usual. Mr. H. Whitehead, gardener to R. W. Gibbs, Esq., was well first, Mr. W. Brooks second, and Mr. G. Sutton third. Miscellaneous plants were well shown.

Cut blooms were quite up to the average, most of the classes being well filled. The best twenty-four incurved blooms, in not less than eighteen distinct varieties, were shown by Mr. J. B. Payne, gardener to the Lord Bishop of Bath and Wells, who had Alfred Salter, John Lambert (2), Queen of England (2), Empress of India, John Doughty (2), Violet Tomlin (2), Robert Cannell, Lord Alcester, Robert King, Miss Haggis, Jeanne d'Arc, Lord Wolseley, Princess Beatrice, Mrs. Shipman, Princess of Wales, Lady Hardinge, and Mrs. Heale. Mr. W. Carpenter, Clifton, was second, and Mr. Brooks third. In the corresponding class for Japanese varieties Mr. Carpenter was first, having Etoile de Lyon, Condor, W. Tricker, W. H. Lincoln, Volunteer, Vivian Morel, Mons. Bernard, Sunflower, G. Daniels, Stanstead White, Mr. J. Clarke, Avalanche, Madame Rocher, M. J. Piggy, W. W. Coles, Puritan, L'Or Japon, A. H. Neve, Gloriosum, Florence Davis, E. Molyneux, Mdle. Lacroix, Belle Paule, and Miss M. Thrower, all good. Mr. J. B. Payne was a creditable second, Mr. Wm. Brooks third. The first prize for twelve varieties went to Mr. A. Currey, gardener to C. Bailey, Esq., Frome, who had W. H. Lincoln, E. Molyneux, W. W. Coles, Etoile de Lyon, Sunflower, A. H. Atkinson, Cleopatrie, G. Daniels, Avalanche, Madame Laing, Mrs. J. Clarke, and C. Sharman, fresh and good. The names of other prizewinners in this and other classes could not be got at, owing to the crowd. Baskets of autumn foliage were remarkably good. Mr. W. Brooks was first in this class, and also with epergnes and bouquets of choice flowers.

Fruit, notably Grapes, Pears, and Apples, were extensively and well shown, local men holding their own against growers from a distance.

ASCOT (No. 2).—NOVEMBER 10TH.

THIS newly formed Society held a remarkably good Exhibition for the first, all sections being exceedingly well represented. Mr. Hoddinott, the Hon. Secretary, deserves praise for his management in the initiative venture, everything worked smoothly.

Cut blooms were staged in large numbers, and were of good quality. The principal class was that for thirty-six distinct, half to be incurved and the remainder Japanese. Mr. A. Sturt, gardener to N. L. Cohen, Esq., Round Oak, Englefield Green, was a decided first, his incurved blooms being large, bright, and well set up, whilst the Japanese were heavy and bright. The names were:—Incurved: Queen of England, Prince Alfred, Empress of India, Golden Queen of England, Violet Tomlin, Golden Empress, Princess of Wales, Lord Alcester, John Salter, Mrs. S. Coleman, Miss M. A. Haggas, Lord Wolseley, Mrs. W. Shipman, Nil Desperandum, Charles Gibson, Princess Teck, Baron Beust, and Barbara. Japanese: Vivian Morel, Stanstead Surprise, Sunflower, Stanstead White, Coronet, Madame C. Audiguier, E. Molyneux, Holborn Beauty, Val d'Andorre, Etoile de Lyon, Gloire de Rocher, Fair Maid of Guernsey, Meg Merrilies, Madame Laing, W. H. Lincoln, Sarah Owen, M. Bernard, and Madame Bacco. Mr. J. F. Thorne, gardener to Major Joicey, Sunningdale Park, Ascot, was second, and Mr. Buckingham, grower to F. Ricardo, Esq., The Friary, Old Windsor, third. Mr. Sturt followed up his previous success by winning the first prize for twenty-four incurved, with blooms similar to those in the principal class. Mr. Buckingham was second. Mr. G. Lane, gardener to Miss Ridge, Highfield, Englefield Green, won the premier award for twelve incurved, distinct with quite the best stand in the Show, the blooms not extra large, but solid, fresh, and well staged. Mr. H. Popple, gardener to the Hon. Lady Cowell Stepney, Wood End, Ascot, was second; and Mr. W. Skeet, gardener to Sir H. D. Gooch, Bart., Clewer Park, third.

In the class for twenty-four, distinct, Japanese, there was a spirited

competition, Mr. Buckingham winning rather easily with a most meritorious stand of blooms of leading varieties. Mr. Sturt was a good second. Mr. F. Thorne won in the class for twelve Japanese, distinct, with a meritorious stand. Mr. G. Lane, was second; and Mr. Lindsay, gardener to Duchess of Buccleuch, Ditton Park, third. Anemone varieties were best staged by Mr. Sturt, who won with twelve blooms. This exhibitor was first for six Japanese, any one variety, with solid blooms of Avalanche.

Specimen plants were remarkably well shown by Mr. Lindsay, huge plants, quite 5 feet in diameter, and carrying over 200 blooms. Mr. Skeet was second with much smaller plants. Groups of Chrysanthemums made a bright display, being arranged on each side of the room. The best in the open class was that from Mr. Lindsay, the plants being dwarf, well clothed with foliage, and carrying good blooms. Mr. Lovejoy, gardener to F. Baxter, Esq., Datchet, was second.

Mr. Thomas, from the Royal Gardens, Frogmore, had, not for competition, a very fine group of Chrysanthemums, which were much admired.

BIRKENHEAD AND WIRRAL.—NOVEMBER 10TH.

THE sixth annual Exhibition of Chrysanthemums and fruit was a perfect success in every way. Mr. Tunnington, one of the judges, said that it was the fifth show he had helped to judge this season, and it was far in advance of the others.

In the open class for twenty-four Japanese Mr. George Burden, gardener to George Cockburn, Esq., Lingdale Lodge, Oxton, was the only exhibitor, also in the class for twenty-four incurved blooms. His flowers were solid, fresh, and excellent in colour, and included George Cockburn, a beautiful deep bronzy sport from Princess Beatrice, which was fixed some three years ago, and has remained true—a very pretty flower.

In the open class for twelve Japanese and twelve incurved Mr. H. Howard, gardener to A. S. Mather, Esq., Church Road, Woolton, was first. In the former he had capital blooms of Florence Davis, Edwin Molyneux, Etoile de Lyon, Mdle. Marie Hoste, Vivian Morel, W. H. Lincoln, and Stanstead White. Mr. J. Williams, gardener to C. J. Procter, Esq., Noctorum, was a very good second. In the class for eighteen Japanese, distinct, Mr. G. Burden was again placed first with a grand stand, the best blooms being Vivian Morel, Etoile de Lyon, and Boule d'Or. Mr. T. Ranson, gardener to H. R. Rodger, Esq., Oaklands, Spital, was a good second, and Mr. E. Broadey third.

In the class for eighteen incurved, distinct, Mr. G. Burden was placed first, having a splendid stand, the best blooms being John Salter, M. R. Bahuant, Jeanne d'Arc, and Queen of England. Mr. T. Ranson again showed remarkably well for a second place. For twelve Japanese, distinct, Mr. J. Trelford, gardener to C. Gatehouse, Esq., Noctorum, was first, and the second prize fell to Mr. A. Price, gardener to F. Jevons, Esq., Claughton. In the class for six Japanese, Mr. J. Williams was successful. Mr. Broadey had a good stand of twelve incurved blooms, and Mr. M. Clary, gardener to R. Hobson, Esq., The Marfords, Bronborough, won with six incurved. For six Japanese, and six blooms, any kinds, distinct, amateurs, Messrs. Swan and Darlington were successful.

The groups of Chrysanthemums were magnificent. The plants were dwarf in habit, with blooms of superb quality throughout. There was but little to choose between the first group exhibited by Mr. H. Benson, gardener to C. T. Gostenhofer, Esq., and the second by Mr. A. Price. For six dishes of fruit, Mr. J. Barker, gardener to J. Raynes, Esq., Rock Ferry, was placed first, having good Muscat and Alicante Grapes, Marie Louise and Beurré Diel Pears, King of Pippins and Ribston Pippin Apples. Mr. M. Hannagan, gardener to R. C. Naylor, Esq., Hooton Hall, was a good second, and Mr. R. Brownbill, gardener to J. C. Sinclair, Esq., Ravenswood, Rock Ferry, third. The same exhibitor was first for two bunches of Alicante and two of Muscat of Alexandria Grapes, being followed by Mr. T. Winkworth, gardener to R. Brocklebank, Childwall Hall, and Mr. T. Ranson. Mr. T. Ferguson, gardener to Mrs. Paterson, Rocklands, Rock Ferry, staged two fine coloured bunches of Gros Guillaume in the class for any other black, and Mr. Brownbill second with fine samples of Gros Colman. For eight dishes of culinary Apples, Mr. M. Hannagan was first; Mr. J. Davis, Bunhill, Bodenham, Leominster, was a close second. In the six dishes of dessert Apples, Mr. Davis was an easy first, and Mr. Hannagan second.

The nurserymen's exhibits were all of the highest quality. The Liverpool Horticultural Co., Garston, had a certificate of merit for cut flowers, wreaths, and crosses. The same distinction fell to Messrs. Dickson, Limited, Chester, for six large baskets, and thirty-six dishes of splendid Apples. Messrs. W. Clibran & Sons, Altrincham, had also a similar honour for thirty-six Chrysanthemum blooms of the newer varieties. Mr. Swan, Secretary, and Committee, are to be complimented on the thorough success of the Show.

TOTTENHAM AND EDMONTON.—NOVEMBER 10TH AND 11TH.

THE fourth annual Exhibition of the Tottenham and Edmonton Chrysanthemum Society was held in the Drill Hall, Park Lane, on the above dates, and for a local show there was an excellent display. Cut blooms were fairly good, the strongest feature, however, being the trained plants, whilst groups, if not numerous, were well arranged.

The principal class in the cut bloom section was for twelve incurved and the same number of Japanese. Mr. W. Welfare was first with a stand of well grown flowers. The incurved blooms were small but neat, and the Japanese were excellent. The Japanese varieties comprised

C. W. Clarke, Etoile de Lyon, W. H. Lincoln, Fair Maid of Guernsey, Stanstead White, Sunflower (the premier bloom in the Show), Alberic Lunden, Gloire de Rocher, Avalanche, Mrs. F. Jameson, A. H. Neve, and Sarah Owen. Incurved: Empress of India, John Lambert, John Salter, Lord Alester, Lady Hardinge, Ami Hoste, Jeanne d'Arc, Miss Violet Tomlin (the premier bloom in this section), Jardin des Plantes, Mrs. Heales, Mrs. Brunlees, and Mistral. Mr. G. W. Hendon was second with smaller blooms. In another class for twelve Japanese Mr. Welfare was first with a stand of good blooms, the second prize going to Mr. G. W. Hendon. Mr. J. Fall, gardener to Samuel Swarbrick, Esq., The Cedars, Tottenham, had the best stand of six Japanese blooms; Mr. G. W. Elliot, High Cross, being second.

For twelve Japanese Mr. F. Gilks, gardener to W. E. Fier, Esq., Elm House, Walthamstow, was first, showing a dozen even blooms. Mr. W. Davey, gardener to C. C. Payne, Esq., Stamford Hill, was second with larger but rather rough blooms, the third prize going to Mr. G. Chalk, gardener to H. V. Lang, Esq., Adderley House, Stamford Hill.

Trained plants were very fine. Mr. G. W. Hendon, gardener to J. Spiers, Esq., Tottenham Park, was first for four standards, Mr. W. Davey being second, and Mr. F. Gilks third. Mr. Hendon was also first for four trained specimens, showing grand plants. The second prize went to Mr. Gilks, and the third to Mr. Davey. Mr. Hendon was again first for a single specimen, showing a magnificent plant of Margot, also for four trained Pompons. Mr. F. Gilks was second, and Mr. Davey third in the former class.

Groups were also very good. Mrs. Winnsett, High Road, Tottenham, was first in one class; Mr. M. England, Tanner's End, Edmonton, being second. In the open class Mr. G. W. Hendon was first with a group of grandly grown plants, the second prize going to Mr. Welfare, and the third to Mr. W. Sapsford, gardener to J. Burbidge, Esq. Mr. W. Elliot had the best group of foliage plants. Mr. H. J. Ives, gardener to Mrs. Chalkley, North Side, The Green, was second; and Mr. W. Thompson, third.

There was a good display of fruit, vegetables, and miscellaneous plants.

WARE.—NOVEMBER 10TH AND 11TH.

THE third annual Chrysanthemum Show of the Ware Horticultural Society was held in the Town Hall on the above dates. In the open classes the competition was in some cases keen, but this could not be said of the groups, though the quality was excellent. Mr. G. Fulford, gardener to R. Walters, Esq., The Priory, Ware, was first in the large group. In the smaller collection Mr. G. Collins, gardener to Stanley Gray, Esq., Canons, Ware, secured premier honours, while Mr. S. Gillians came second. Specimen plants, Pompons, found Mr. J. Turk, gardener to P. Bosanquet, Esq., Little Berkhamstead, first, and Mr. Fulford second.

Cut blooms were very strong. Twelve incurved and twelve Japanese, distinct, were closely contested by Messrs. J. Turk and G. Fulford. The former proved victorious by a few points, his Violet Tomlin, Golden Empress, Vivian Morel (grand), W. W. Coles, and Avalanche being most conspicuous. Mr. Fulford excelled in Golden Empress, Empress of India, Violet Tomlin, Stanstead White, Avalanche, Sunflower, and Etoile de Lyon. In the class for twelve incurved Mr. Fulford proved too formidable for his rival, his blooms being very even and fresh. His bloom of Mrs. Robinson King was the finest we have seen through the season. Violet Tomlin, Mons. R. Bahuant, and White Empress were also good. Mr. Turk's blooms were not quite so even. The latter exhibitor was first in the twelve Japanese, closely followed by Mr. Fulford. In the smaller classes Mr. Dover led with incurved varieties, followed by Mr. G. Collins. With Japanese Mr. D. Phillips, gardener to Rev. E. E. W. Kirkby, was first, followed by Messrs. Collins and Dover. Six blooms, one variety, was taken by Mr. Fulford with a fine stand of Etoile de Lyon.

Grapes were not numerous shown, but the classes for Apples and Pears were keenly contested. Mr. Smith's Pears were excellent, as were Mr. Turk's dessert Apples. Vegetables were also good.

PUTNEY.—NOVEMBER 10TH AND 11TH.

THIS annual Show was held in the Cromwell Hall, Putney, on the above dates. The entries were not so large as in previous years, but the Show as a whole was an excellent one. The arrangement of the Show and the convenience for visitors were good in every way, reflecting credit on the Committee of management and the Secretary, Mr. J. Moore.

Mr. Dark, gardener to J. Hooker, Esq., Lomond House, Putney, had the best group. All his plants were sturdy and carrying healthy foliage and excellent flowers. Mr. Poe, gardener to Colonel Poe, C.B., Putney, and Mr. Reeves, gardener to G. Allen, Esq., Putney Hill, were second and third respectively. Mr. Portbury, gardener to W. N. Fry, Esq., Putney Hill, was awarded the special prize given by G. H. Pitt, Esq., Chairman of the Society, for a miscellaneous group of foliage and flowering plants. Mr. Methven, gardener to W. Keighley, Esq., Wimbledon Park, was second. Mr. McLeod, gardener to S. Morgan, Esq., Roehampton, also staged a mixed group, which was highly commended.

Cut blooms were good. Mr. Knowles, gardener to Mrs. Egerton, Putney, gained the first prize for twenty-four incurved blooms, distinct; Mr. Portbury being second, and Mr. J. Bentley, gardener to Lady Gabriel, Wimbledon Park, third. Mr. Knowles was again first for twelve incurved, and Mr. J. Bentley second. For the premier incurved bloom Mr. Knowles was first with a grand example of Empress of India. For six incurved blooms Mr. C. Bentley, gardener to W. J. Bosworth,

Esq., Roehampton, was first; Mr. Wright, gardener to H. A. Tufnell Esq., second; and Mr. Mynett third.

Japanese blooms were excellent, particularly those shown by Messrs. Knowles, Portbury, and Wright, who gained the prizes in the order named for twenty-four distinct varieties. Mr. Knowles was also first for twelve blooms, and Mr. Wright second. For six blooms Mr. Mynett was first, Mr. C. Bentley second, and Mr. Reeves third. Mr. Mynett was awarded the prize for the premier Jap with a very fine bloom of Sunflower.

Anemones and reflexed were best shown by Mr. Knowles. Mr. C. Bentley was first for Pompons, showing some really grand flowers. Specimen plants were fairly well shown. The amateurs' and single-handed gardeners' classes were very well filled, some excellent blooms and specimen plants being exhibited in each case.

Mr. Reeves showed some excellent Primulas, for which he was awarded the first prize. The collections of fruit and vegetables were decidedly good. Stove and greenhouse plants were shown in splendid condition by Mr. Methven, as also were some Ferns by Mr. J. Bentley.

WINCHESTER.—NOVEMBER 10TH AND 11TH.

THE annual Exhibition was held in the Guildhall on the dates named, and was altogether excellent—certainly one of the best, if not the very best, that has been seen in the ancient city. Cut blooms formed the most important feature. Groups were good, as were some of the specimen plants, and fruit and vegetables were admirably represented.

The principal prize for cut blooms was the challenge cup offered by the ladies of Winchester, in addition to the first prize of £5 given by the Society, for forty-eight in thirty-six varieties, half incurved, and the remainder Japanese. Mr. N. Molyneux, gardener to J. C. Garnier, Esq., Rooksbury Park, Wickham, Fareham, won by the superiority of his incurved blooms, the Japanese being weaker. The varieties were—Incurved: Golden Queen of England (2), Empress of India (2), Golden Empress (2), Lord Alcester (2), Miss Haggas (2), Mrs. S. Coleman (2), Violet Tomlin, Queen of England, Mrs. Heale, Mrs. Robinson King, Empress Eugénie, Princess Teck, Mrs. Mitchell, Lord Wolseley, Mrs. W. Shipman, Nonpareil, Mr. P. Mudie, and M. P. L. Blancard. Japanese: Etoile de Lyon (2), Mrs. F. A. Spaulding (2), Vivand Morel (2), Alberic Lunden, Florence Davis (2), Condor (2), Mdle. M. Hoste (2), Lilian B. Bird, Val d'Andorre, A. H. Neve, Sunflower, Madame J. Laing, W. H. Lincoln, Puritan, Edwin Molyneux, Mrs. C. Wheeler, Stanstead White, and Vice-President Audiguier. Mr. Neville, gardener to F. W. Flight, Esq., Twyford, Winchester, was a good second with heavier and superior Japanese, but smaller, yet very good, incurved. Mr. Agate, Havant, was third.

For twenty-four Japanese, not less than twelve varieties, Mr. H. R. Brown, gardener to A. B. Welch-Thornton, Esq., Beaupaire Park, Basingstoke, was placed first with a creditable stand. The most noteworthy blooms were Stanstead White, E. Molyneux, Pelican, Mrs. F. Jameson, A. H. Neve, Sunflower, and Avalanche. Mr. G. Linden, gardener to Sir H. Mildmay, Dogmersfield Park, Winchfield, was a close second; Mr. Neville third. The best twelve incurved, distinct, were contributed by Mr. N. Molyneux with medium sized but neat blooms; Mr. Neville was second. Mr. N. Molyneux was also successful with Lord Alcester for six of any incurved variety, Queen class only; and also for the same number of any but the Queen class with Mrs. Coleman, full, fresh, and neat. Mr. Neville was second with Robert Cannell. For six blooms, any white Japanese variety, Mr. N. Molyneux staged Mdle. Marie Hoste in magnificent condition. So good were they that the N.C.S. certificate of merit was awarded in addition to the first prize. Mr. C. H. Holloway, gardener to F. N. C. Read, Esq., The Wakes, Selborne, Alton, was second with Avalanche in prime condition. Mr. Molyneux followed up his previous success by securing first honour in the class for six any one Japanese variety, excluding white, with Etoile de Lyon in perfect condition. Mr. Neville second with Vivand Morel, richly coloured. Mr. R. H. Brown won the first prize for twenty-four, in not less than eighteen varieties; Mr. Linden second.

For the best group of Chrysanthemums, arranged in a space 8 feet by 7 feet, Mr. G. H. Street, gardener to the Rev. Dr. Fearon, The College, Winchester, was placed first, with the best group yet seen at Winchester. Mr. F. Broomer, The Weirs, was a good second. For eight trained specimens, Mr. E. Carr, gardener to W. A. Gillett, Esq., Fair Oak Lodge, Bishopstoke, won the premier award; as also he did for one specimen Japanese with Madame A. Rendatler, fully 5 feet in diameter, freely flowered.

Grapes were contributed in good numbers and of superior quality. For three varieties, one bunch of each, Mr. Budd, gardener to F. Dalgety, Esq., Lockerby Hall, Romsey, was first; Mr. J. Gardener, gardener to Col. H. Stratton Bates, Twyford Lodge, second. For two bunches any black variety, Mr. Gardener was first with Alicante in prime condition, as also was he for the same number of any white. Apples and Pears were shown in good condition and numbers by Mr. Hall, gardener to S. Montagu, Esq., South Stoneham House, and Mr. Trinder. Vegetables by Mr. Bowerman, gardener to C. Hoare, Esq., Hackwood Park, Basingstoke, and Mr. G. Best, gardener to Mrs. Chute, The Vyne, Basingstoke. Mr. Hillier, Winchester, staged a large collection of Apples which were highly commended.

The silver medal of the N.C.S. was awarded to Mr. N. Molyneux for excellence of culture in his cup stand of blooms.

Mr. E. Molyneux, gardener to W. H. Myers, Esq., M.P., Swanmore Park, Bishop's Waltham, staged a collection of cut Chrysanthemums "not for competition," consisting of Japanese, incurved and single

varieties quite up to the best exhibition form, also two dozen bunches of Pompon and single varieties tastefully arranged in vases, which added to the attractiveness of the Exhibition.

EXETER.—NOVEMBER 11TH.

THE annual autumn Exhibition of this Society was held on the date named in the Victoria Hall, a site well adapted for such a Show. This Society dates back as far as 1829, the schedule containing a list of its Presidents from that date, Lord Clifford being its first, the present being the 176th Exhibition of this Society. Cut blooms and hardy fruit were by far the most important parts of the Show. The former were contributed in large numbers and splendid condition. Fully 600 dishes of the latter were staged, making a splendid display, especially as the majority carried magnificent colour.

Cut blooms of Chrysanthemums made a splendid display. For thirty-six Japanese, distinct, a silver cup was offered, which brought seven competitors. Mr. G. Hawkins, gardener to W. H. Fowler, Esq., Claremont, Taunton, won it with a grand collection most tastefully arranged. The varieties were Stanstead White (to which was also awarded the prize for premier bloom), W. W. Coles (fine), W. H. Lincoln, Mrs. T. Clarke, Puritan (massive), E. Molyneux, Mrs. E. D. Adams, Etoile de Lyon, F. Davis, M. Bernard, Ralph Brocklebank, Sunflower (superb), Avalanche, Mrs. C. Wheeler, Potter Palmer, Madame J. Laing, Mr. E. Beckett, Gloire de Rocher, A. H. Neve, Japonaise (fine), Gloriosum, Violet Rose, Sarah Owen, Lord Brooke (extra fine), S. Dibbans (good), Mrs. A. Hardy (excellent), Madame Bacco, Lady Lawrence, Mr. G. Bryceson, Lilian Bird, Vivand Morel, M. Freeman, Mrs. J. S. Fogg, Louis Boehmer, Coronet, and Miss A. Harzthorn. Mr. G. Foster, gardener to H. Hammond Spencer, Esq., Glendanaugh, Teignmouth, was second, and Mr. Stiles, gardener to Miss Fripp, The Grove, Teignmouth, third.

For eighteen Japanese, distinct, six competed, making a bright display. Mr. W. Connolly, gardener to J. C. P. Talbot, Esq., Exeter, won the first prize with a splendid collection, large, bright in colour, but not well staged, the varieties being Florence Davis, Edwin Molyneux (superb in colour), Etoile de Lyon, Thunberg, Mrs. E. W. Clarke (immense size), Mrs. F. Jameson, Louis Boehmer, Sunflower, Stanstead White, Madame Bacco, Condor, Madame J. Laing, Gloire de Rocher, Avalanche (fine), Sarah Owen, Volunteer, M. Bernard, and Mrs. A. Hardy. Mr. Fowler was a close second, having Vivand Morel, Louis Boehmer, F. Davis, Etoile de Lyon, and Miss A. Harzthorn (very fine). Mr. Foster was third. For twelve Japanese, distinct, Mr. Scarle, gardener to Miss Boyd, Torquay, won the premier position with a good collection. Mr. J. Bishop, gardener to the Rev. F. C. Drake, Henlade, Tawton, second. Mr. Stiles third.

Incurved were not shown so meritoriously as were Japanese. For twenty-four, distinct, Mr. Foster was just ahead of Mr. Stiles for first place, both staging medium-sized neat blooms. Mr. F. Prothero, gardener to W. McKenzie Bradley, Esq., Exmouth, third. The class for twelve incurved produced better quality than the larger one. Mr. J. Bishop won the premier award with an even stand of blooms, well staged, of the following varieties—Lord Alcester, Violet Tomlin, Golden Empress, Empress of India, Bronze Queen of England, Mrs. S. Coleman, Ami Hoste (very fine), Miss Haggas, Jeanne d'Arc, Princess Alice, Queen of England, and Cherub. Mr. Connolly was second. Mr. J. B. Payne, gardener to the Bishop of Bath and Wells, third, all close, eight competing.

Anemone varieties were well shown by Mr. Prothero, who was first with twelve distinct varieties. Mr. H. Veole, gardener to the Rev. H. Simms, Torquay, was second. Mr. Bond, gardener to F. Knopman, Esq., Exeter, had the best Pompons and single varieties in six varieties. The premier incurved bloom was Golden Queen of England in Mr. Connolly's stand of twelve incurved.

Grapes were capitally shown by Mr. Payne in the class for three bunches Alicante. Mr. W. Martin, gardener to Lord Poltimore, Poltimore Park, Exeter, was second. Mr. Connolly had the best three bunches Muscat Alexandria, fine examples. For three bunches of any other kind Mr. J. Wensley, gardener to J. H. Miller, Esq., Exeter, was first with Lady Downe's in perfect condition.

Apples were finely shown. In the class for twenty-four varieties, five fruit of each kind, Mr. A. C. Williams was placed first for a splendid exhibit of leading varieties, not large but of rich colour. Mr. J. Garland, gardener to the Hon. Sir T. D. Ackland, Exeter, a good second. Mr. J. Gibbins, gardener to the Rev. J. D. Gibbs, Exeter, won in the class for twelve dishes with really splendid fruit. Mr. Martin won with six varieties dessert kinds with excellent examples.

Messrs. R. Veitch & Sons, Exeter, had a very fine collection of Apples, "not for competition," for which was awarded a certificate of merit, a similar honour falling to Mr. Jarman, Chard, for Apples and Onions. To Mr. Godfrey, Exmouth, was given a first-class certificate for Chrysanthemum Beauty of Exmouth. Mr. Cann, the Hon. Secretary, deserves a word of praise for the admirable manner in which he managed such a fine exhibition.

BRADFORD.—NOVEMBER 11TH AND 12TH.

THIS Exhibition was held in the Technical College, and generally speaking indicated that the above date is somewhat early for a late district like that of Bradford. This was particularly noticeable amongst the incurved flowers. In the open classes the quality of the blooms, especially the Japanese section, were remarkably good.

For twenty-four incurved blooms, not less than eighteen varieties,

G. Cockburn, Esq., Lingdale Lodge, Birkenhead (gardener, Mr. G. Burdon), was first. This exhibitor staged Mons. R. H. Bahuant (2), Empress of India (2), Queen of England (2), Jeanne d'Arc (2), Mrs. Heale, Golden Empress (2), John Salter (2), John Lambert, Alfred Salter, Lord Alcester, Mr. Bunn, Lord Wolseley, Mrs. Shipman, Sir Staff. Carey, Lady Hardinge, Prince Alfred, a new variety under the name of G. Cockburn, and Princess Beatrice. Mr. Cockburn was the only exhibitor in this class. For twenty-four Japanese, in not less than eighteen varieties, Mr. Cockburn was again placed first with fine examples of Etoile de Lyon (2), E. Molyneux (2), Sunflower, Stanstead White, Mrs. F. Jameson, Puritan (2), W. H. Lincoln, Florence Davis, Mrs. Irving Clarke, Mons. Bernhard (2), Sarah Owen, Pelican, Criterion, Mdle. Marie Hoste, Vivand Morel, Avalanche, Boule d'Or, Lillian B. Bird, Gloire de Rocher, and Vivand Morel. The second prize was awarded to C. J. Omerod, Esq., Green Royde, Brighthouse (gardener, Mr. A. Barber); Mrs. Roundell, Gledstone, Skipton (gardener, Mr. J. Bell), being third. Mr. G. Burdon also was successful in class for twelve Japanese and twelve incurved. Mr. A. Barber secured the first prize in the class for six Japanese, one variety, with magnificent blooms of Puritan.

In the local class for twelve Japanese (dissimilar), A. Jacobs, Esq. (gardener, Mr. T. Newbould), was placed first. This gentleman also won chief honours all through the remaining classes. For the second year in succession Mr. T. Newbould also exhibited a very fine "sport" from Madame Bacco, which secured the National Society's certificate of merit.

Groups of Chrysanthemums were staged by B. Priestly, Esq., M.P. (gardener, Mr. W. Butters), E. W. Hammond, Esq., Horton Hall (gardener, Mr. J. Keighley), C. R. Hindley, Esq., Gathorne, Horton (gardener, Mr. J. Swainston, these winning in the order named.

Bouquets were a great feature. Messrs. Perkins & Sons of Coventry securing the first prizes for the brides' and hand bouquets with two very choice and tastefully arranged examples.

A very fine and effective group of ornamental foliage plants was exhibited by Mr. T. Horsman, nurseryman, and another very similar group by Mr. Thos. Haw. Great credit is due to the Hon. Sec., Mr. G. R. Taylor, for the able manner in which all the details of the Show were carried out.

White Grapes were exhibited by Messrs. H. Dickenson, Shardlow, Derby, A. Faulkes, Esq., Farnley Hall, Otley, first and second respectively. A. Jacobs, Esq., Craigroyd, Kanedon, and Mr. Dickenson, secured the prizes for black Grapes.

LEICESTER.—NOVEMBER 11TH AND 12TH.

THE sixth annual Show was held in the Floral Hall, which is an excellent building for the purpose. There were about 200 entries altogether, and the Show, on the whole, was better than any previous occasion, although the incurved blooms were scarcely so good as last year.

The first prize for twenty-four incurved blooms was won by Mr. H. Shoesmith, gardener to M. Hodgson, Esq., Shirley, Croydon. Good blooms of Golden Empress, Lord Alcester, Violet Tomlin, Madame Darrier, Lady Dorothy, and Hero of Stoke Newington were in this stand. Mr. A. Coombes, gardener to Earl Dudley, Himley Hall, was second; and Mr. W. H. Divers, gardener to J. T. Hopwood, Esq., Ketton Hall, third. Mr. H. Shoesmith was also first for twenty-four Japanese, staging splendid blooms of Vivand Morel, W. W. Coles, Mdle. Marie Hoste, E. Molyneux, Sarah Owen, and Stanstead White. Mr. J. Underwood, gardener to R. Walker, Esq., Enderby Hall, Leicester, was second; and Mr. W. H. Divers third; from the latter's stand a very fine example of Vivand Morel was selected as the premier Japanese bloom in the Show, and for which a certificate was given. For twelve blooms, six incurved and six Japanese, Mr. J. Copson, Collingtree Grange, Northampton, was first with a grand stand of both Japanese and incurved.

In the class for twenty-four blooms, twelve incurved and twelve Japanese, open only to the county of Leicester, for a silver cup, Mr. Dunkley was first; his best blooms were Lord Alcester, J. Doughty, Golden Queen, Empress of India, Golden Empress, Hero of Stoke Newington, Vivand Morel, Miss A. Hartzhorn, Edwin Lonsdale, Avalanche (very good), and Etoile de Lyon. The Rev. J. Bird was second, Mr. J. Underwood third. Mr. H. Dunkley was again first for twelve blooms, six incurved and six Japanese, having Queen of England, Lord Alcester, Golden Empress, and Avalanche in splendid condition. In the cottagers' classes some of the blooms were nearly equal to those shown by the gardeners, Mr. J. Whait and Mr. C. Day showing very fine examples of Vivand Morel and Golden Empress.

Three groups of plants were staged, the first prize going to Mr. H. Rogers, florist, Leicester; Mr. W. Calvert, gardener to G. Oliver, Esq., Hughenden, second; Mr. J. Smith, gardener to S. Bennett, Esq., Holmdale, third. Mr. G. Barry, gardener to H. Snow, Esq., Glenwood, was first for a bouquet. For a basket of Chrysanthemums Mr. J. Smith was first, and Mr. G. Barry second.

In the fruit classes the two bunches of Grapes were sent not for competition by Mr. W. J. Thornton, nurseryman, Marlborough, and these were awarded a certificate of merit. Certificates were also given to Mr. G. R. Lawson, gardener to Mrs. Ellis, Knighton Hayes, for a fine collection of Apples, and to J. Ellis, Esq., for a similar exhibit. A certificate was also given to Messrs. Harrison & Son of Leicester for a good collection of vegetables, and Mr. Rogers received a similar award for a wreath. Table plants were good, the prizes going to Mr. Rogers, Mr. Smith, and Mr. Calvert in the order named. Mr. Burns sent foliage

plants from the Abbey Park, which added considerably to the effect of the Show.

SHEFFIELD, HALLAMSHIRE, AND WEST RIDING.

NOVEMBER 11TH AND 12TH.

THE tenth annual Show was held, as in previous years, in the Corn Exchange, and proved a very fine and attractive display.

In the open classes for twenty-four incurved and twenty-four Japanese, cut blooms, around which most interest centred, there were six competitors. Mr. R. Parker, Impney Hall Gardens, Droitwich, was first in each class with very good flowers. The Japanese were large, bright, and fresh, and the incurved, though perhaps not quite so large and heavy as usual, were fine, smooth, solid blooms. The Princess of Wales family were particularly good. The varieties were John Lambert (2), Queen of England, Empress of India (2), Lord Alcester, Mons. R. Bahuant, Golden Empress, Violet Tomlin (2), Mrs. Coleman, Queen of England, Mrs. Robinson King, Princess of Wales (2), Mrs. Heale, Miss Haggas (2), Chas. Gibson, Lord Eversley, Lord Wolseley, Princess Teck, Lady Hardinge, and Jeanne d'Arc. Other prizewinners in this class were Mr. A. Coombes, Himley Hall Gardens, Dudley, second; Mr. C. Osborn, Liverpool, third; and Mr. James Douglas, Ilford, fourth. The same exhibitors each occupied respective places in the class for twenty-four Japanese. The varieties in Mr. Parker's first-prize lot were Vivand Morel (2), W. H. Lincoln (2), Mdle. M. Hoste (2), W. W. Coles, Etoile de Lyon, Stanstead White, Boule d'Or (2), Gloire du Rocher, Florence Davis (2), E. Molyneux, Sunflower, Alberic Lunden (2), Avalanche, Madame C. Audiguier, Thunberg, W. K. Woodcock, W. Tricker, and Mr. G. Herring.

In the classes for twelve incurved and twelve Japanese Mr. Parker was again first. His varieties were:—Incurved: Queen of England, Empress of India, Mons. R. Bahuant, John Lambert, Lord Alcester, Mrs. Robinson King, Mrs. Heale, John Doughty, Alfred Lyne, Miss Haggas, Princess of Wales, and Mrs. Coleman. Japanese: Etoile de Lyon, Stanstead White, Boule d'Or, Vivand Morel, Florence Davis, Mdme. C. Audiguier, Mdle. M. Hoste, E. Molyneux, Alberic Lunden, Avalanche, W. Tricker, and Kate Mursell.

In the various local and district classes there were many very good flowers shown, especially in the Japanese section; but in the incurved there was a decided falling off. This probably was owing to the lateness of the flowers in the district this season. The silver medal, given for the best Japanese bloom in these classes, was won by Mr. H. Broomhead, the popular Treasurer of the Society, with a superb flower of Vivand Morel, the best in the Show.

Groups arranged for effect were numerous, and formed a fine feature of the Show. For the group of miscellaneous foliage and flowering plants Mr. E. Pidsley, gardener to Mrs. H. Wilson, was first with a charming arrangement. For the group of Chrysanthemums Mr. W. Redmill, gardener to G. Lowood, Esq., was first, and Mr. C. Green, gardener to Sir H. E. Watson, second.

Specimen plants have not previously been better shown at this Show than on this occasion. For six plants large flowering, distinct varieties, the awards were:—Mr. C. Scott, gardener to J. Colley, Esq., first; Mr. C. Green second; Mr. E. Pidsley third; Mr. R. Agar, gardener to S. Roberts, Esq., fourth. These exhibitors secured the prizes in other classes.

Primulas were shown in large numbers and of first-class quality, as also were British Ferns. Mr. John Eadon staged a group of the latter, which included many rare and beautiful specimens. Messrs. S. W. Seagrave, Crossland & Sons, and Fisher, Son, & Sibray all staged fine groups of miscellaneous plants, not for competition.

Mr. J. Nelson, of Thorn Bank Nurseries, Catcliffe, Rotherham, showed more than 100 dishes of very fine Apples, demonstrating fully what fine fruit under good cultivation may be produced in what is generally considered a most unfavourable situation.

Mr. H. J. Jones, Ryecroft Nurseries, Higher Green, Lewisham, staged a magnificent collection of cut flowers of Chrysanthemums, forming, as it was said, quite a show in itself. The blooms were mostly very large and fine, good enough for open class competition, and contained amongst them numerous new varieties.

BATLEY AND DISTRICT.—NOVEMBER 12TH.

THIS Exhibition was held in the Drill Hall on the above date. Groups of Chrysanthemums were a fine feature, and bore evidence of the steady improvement in the culture of the plant in this district. G. Sheard, Esq., Upper Batley (gardener, Mr. J. C. Davis) was placed first with a magnificent collection rather too stiffly arranged. R. J. Critchley, Esq., Hyrst House, Batley Carr, was second; and J. Stubley, Esq., Carlton Grange, Batley (gardener, Mr. W. J. ffries) third; and J. J. Carter, Esq., Upper Batley (gardener, Mr. S. Stubley) fourth.

In the open class (cut blooms) Mr. J. P. Leadbetter, gardener to A. Wilson, Esq., Tranby Croft, Hessle, secured premier position for twenty-four, twelve incurved and twelve Japanese. The varieties were, Incurved: M. R. H. Bahuant (2), Queen of England, J. Lambert (3), Lord Alcester, J. Doughty, Golden Empress, J. Lambert, Lord Wolseley, Empress of India, and Alfred Salter. Japanese: Concorde (2), W. W. Coles, Puritan, Vivand Morel (2), W. H. Lincoln, Mons. Bernhard, F. Davis, Madame Baco, Stanstead White, and Sunflower. Mr. P. Blair was a close second, the Japanese flowers being superior to those in the first prize stand. The best blooms were Vivand Morel, Puritan, Mr. E. Becket in the Japanese, and Madame Darrier in the incurved. Mr. J. Thornton, nurseryman, Drighlington was close behind for third. For twelve varieties, six Japanese and six incurved, Mr. Blair was first, Mr.

J. P. Leadbetter second, and Mr. W. H. Atkinson, Cemetery Lodge, third. For bouquets of Chrysanthemums Mr. Blair was first and Mr. Thornton second.

A fine collection of fruit was exhibited by Mr. W. Green, nurseryman, Garforth, Leeds, comprising the leading varieties of Pears and Apples.

READING.—NOVEMBER 15TH AND 16TH.

THE Show at Reading was in every way an excellent one, the groups being particularly noticeable. The cut blooms were also conspicuous, being mostly excellently shaped and neat.

The first prize for a group was awarded to Mr. Turton, gardener to J. Hargreaves, Esq., Maiden Erlegh. His plants were all well grown, being finely foliaged and flowered. Mr. Frost, gardener to W. Palmer, Esq., Reading was second with a fine group, the plants in it being dwarfer than those of Mr. Turton, but not carrying such good flowers. Mr. Simmons, gardener to J. Wheeler, Esq., Reading, was third. In the groups, open to single-handed gardeners only, Mr. Smith, gardener to Miss Russell, Reading, was first with a most creditable arrangement. Mr. Goddard, gardener to J. W. Hounslow, Esq., Reading, was second; and Mr. Mayne, gardener to Lord Saye and Sele, Reading, third.

For twelve incurved blooms, distinct, Mr. Lane, gardener to Miss J. D. Smith, Ascot, was first, his stand containing some of the most perfect flowers in the Show. Mr. Sturt, gardener to N. L. Cohen, Esq., Englefield Green, was second, and Mr. Goldsmith, gardener to Sir E. Loder, Bart., Horsham, third. In the class for forty-eight cut blooms, twenty-four each, Japanese and incurved, Mr. Neville, gardener to F. W. Flight, Esq., Twyford, was awarded first prize for a magnificent stand of flowers. Mr. Lane was second and Mr. G. Garner, Christchurch, third. The entries in this class were numerous, all the stands being most commendable.

Mr. Ashman, gardener to C. D. Crews, Esq., Billingbear, was awarded the first prize for twelve Japanese blooms, distinct; Mr. Knowles, gardener to F. Crisp, Esq., Henley, being second; and Mr. Maxim, gardener to the Hon. Miss Shaw-Levebre, third. The competition was keen in this class, the prizes being thoroughly deserved by each of the winners. For twelve incurved Japs, Mr. Neville was awarded first prize for a most charming exhibit, Mr. Ashman being second, and Mr. Lane third. Mr. Neville was also given first prize for twelve reflexed Japs; Mr. Ashman and Mr. Maxim being second and third respectively. For twelve reflexed blooms, distinct, Mr. Sturt was awarded the first prize.

Mr. Frankland, gardener to F. A. Lucas, Esq., Sonning, was first for specimen plants, and Mr. Surman, gardener to M. H. Best, Esq., Donnington, second. The first prize for four Japanese was awarded to Mr. Frost; Mr. Booker, gardener to W. B. Monek, Esq., Coley Park, and Mr. Powell, gardener to G. Gilligan, Esq., Reading, being second and third in the order named. Mr. Ashman was awarded the first prize for six table plants, his exhibit being excellent; Mr. Lane second, and Mr. Knowles third. Mr. Frost was awarded the first prize for a beautifully arranged large table vase, also for a small one. Miss Phillips, Reading, gained the first prize for a stand of cut flowers and foliage, which was most charmingly arranged. The same lady was awarded first prize for a stand of autumn leaves.

Plants, Tomatoes, and fruit were splendid; but pressure on our space forbids our giving a detailed report.

Mr. Owen, Maidenhead, staged a fine collection of cut blooms "not for competition." Mr. Phippen, Reading, showed an excellent group of foliage plants, in the midst of which were a cross and bouquet of white flowers, the effect of the flowers on the foliage being exquisite.

WIMBLEDON.—NOVEMBER 15TH AND 16TH.

THE Show at Wimbledon this year was a distinct advance on its predecessors, and those who imagined it would be composed of inferior material received a great surprise. Messrs. Mease and Carpenter, particularly the former, staged magnificently, and their contributions alone made the Exhibition a fine one. Mr. Mease, who carried all before him, had some of the finest, if not the finest, blooms staged this season, his forty-eight being many points in advance of his splendid winning stand at Kingston-on-Thames. The silver cup offered by W. B. Faulkner, Esq., at last became his property, this making his third win for it, and it will be conceded that he has fairly earned the handsome trophy. Some particulars of the Show are appended.

The most remarkable feature of the cut-bloom classes was the stand of twenty-four incurved and twenty-four Japanese, staged by Mr. Mease, gardener to A. Tate, Esq., Downside, Leatherhead, for the cup offered by W. B. Faulkner, Esq. Both sections were magnificently represented, the flowers being very heavy, finely proportioned, fresh, and well finished. The Japanese were as follows: Vivian Morel (a splendid flower, selected as the best Japanese in the Show), Alberic Lunden, Geo. Daniels, Sunflower, Condor, Edwin Molyneux, Boule d'Or, Etoile de Lyon (the latter being a splendidly coloured flower), Puritan, Violet Rose, Florence Davis, G. C. Schwabe (fine), Lilian Bird, Mdle M. Hoste (superb), Mrs. E. W. Clarke, J. Stanborough Dibben, Mdme. Baco, Eda Prass, Mrs. Wheeler (in beautiful condition), Mr. A. H. Neve, Cesare Costa, Sarah Owen, Mdle. Lacroix, and Louis Boehmer. The back row incurved were John Lambert (very fine), Queen of England (2), Mons. Bahuant (2), Lord Alcester (2), and Empress of India. The end bloom of Lord Alcester was a magnificent example, $4\frac{1}{2}$ inches deep, and was selected as the best incurved in the Show. It was one of the finest ever staged. The middle row flowers were Violet Tomlin, Golden Empress (2), Jeanne d'Arc, Robert Cannell, Empress of

India, Princess of Wales, and Mrs. Coleman, the latter being one of the best examples seen this season. The front row flowers were Mrs. Coleman, Princess of Teck, Mrs. Norman Davis, Lady Dorothy, Miss Haggas, Hero of Stoke Newington, Mrs. Shipman, and Mrs. Heale. Mr. Carpenter, gardener to Major Collis Browne, Byfleet, was second with splendidly coloured flowers, but they were many points in the rear of the cup stand. Amongst the Japanese, Lizzie Cartledge, Lilian Bird, and G. C. Schwabe were very fine, while the incurved included a beautiful bloom of Princess Beatrice, and good examples of Mr. Brunlees, Mrs. Coleman, and Jardin des Plantes. Mr. Ritchings, gardener to Dr. Frankland, was a good third, gaining points with incurved, but losing with Japanese. His back row incurved were very fine blooms, particularly Emily Dale and Empress of India. Vivian Morel and Sunflower were very good among the Japanese.

For twenty-four blooms, twelve each Japanese and incurved, Mr. Mease again won. His Japanese were much too large for the board, and had colour as well as size, the incurved also being deep and good. Mdle. Lacroix, Etoile de Lyon, Mrs. Coleman, and Mons. Bahuant were all very fine. Mr. Carpenter was once more second with smooth, clean flowers, such as he usually shows, lacking weight and substance, however, as compared with the others. Mr. Mease scored another victory with twelve incurved, his Robt. Cannell, Mons. Bahuant, Mrs. Heale, and Violet Tomlin being the best of a first-rate box. Mr. Carpenter was again second; Mr. H. Alderman, gardener to G. Hatfield, Esq., being third with small but very neat flowers. Precisely the same result followed in the class for twelve Japanese. Mr. Mease was first with a splendid box, in which Etoile de Lyon, G. C. Schwabe, and J. Stanborough Dibben, were conspicuously fine. Mr. Carpenter had weight, but lacked his usual finish; Criterion was, however, splendid.

There were several good stands of six reflexed, the best being that from Mr. Mease. The varieties were lilac and golden Christine, Cullingfordi, and Cloth of Gold, all very good. Mr. Carpenter was second, and Mr. W. J. Wright, gardener to H. A. Tuffnell, Esq., third. The latter won with large Anemone-flowered, having a very neat box. Mr. Bentley, gardener to Lady Gabriel, was second. A. Nagle, Esq., Kingston, was first with Pompons; Mr. H. Alderman second, and T. J. Berridge, Esq. third. In the local classes the principal winners were Messrs. Portbury, gardener to W. N. Troy, Esq.; J. Bentley, H. Hawkes, gardener to G. B. Tate, Esq.; Skeggs, Hogger, J. Brown, J. Tunnate, and W. Yalden. In the amateurs' section there were some excellent flowers. Dr. Walker won with six incurved for Mr. Luff's prize, W. B. Faulkner, Esq., being second. W. Northover, Esq., won with six Japanese, the Doctor here coming second, and E. Linfield, Esq., third. Mr. Faulkner had an excellent stand of twelve Japanese, Dr. Walker being second, and Mr. Nagle third. Mr. Northover had the premier Japanese, a good example of Mdle M. Hoste. Dr. Walker had the best stand of twelve incurved, the flowers being small, but very neat, Messrs. Faulkner and Nagle being second and third. Dr. Walker won with six for the Society's prizes, Mr. Linfield being second, and Mr. Northover third. Dr. Walker's Golden Empress was the premier incurved.

Mr. Bradford, gardener to W. Hopc Hall, Esq., won the tradesmen's silver cup for a group. His blooms were good, but the group looked unfinished, the front plants being $3\frac{1}{2}$ to 4 feet high. Mr. Thornton, gardener to T. E. Crocker, Esq., was second; and Messrs. J. & A. Bateman third. Mr. Law, gardener to R. Dean, Esq., had an attractive miscellaneous group, albeit lacking colour. Mr. Bradford was second. Mr. Day won with a smaller group of Chrysanthemums. Mr. Bentley won with a single trained Pompon, and Messrs. Bateman with a large flowered variety. Table plants, basket Primulas, and fruit added to the interest of the Show. Messrs. Thomson & Sons had a mixed group of plants, while Messrs. E. D. Shuttleworth & Co., Limited, showed choice foliage plants.

TWICKENHAM.—NOVEMBER 15TH AND 16TH.

THE Town Hall at Twickenham presented a very bright appearance on the occasion of the Chrysanthemum Show this week. The main hall was reserved for groups and plants, plenty of room thus being afforded for promenading, but the cut blooms had to be placed in a rather small room, where there was not too much space, and on the whole it would, perhaps, have been better to have had a central staging for them in the large hall. The Committee, no doubt, did what they judged to be the best, and the arrangements were certainly excellent.

There were five groups in competition, all possessing points of merit. Mr. Simmonds, gardener to W. Cunard, Esq., was first with a collection of very healthy plants, carrying large fresh flowers, but the group was somewhat too closely packed, the flowers sloping in an even mass from top to bottom; a little more freedom would have been an advantage. However, Mr. Simmonds merits the credit of a very attractive arrangement. Mr. Parsons, gardener to T. Twining, Esq., was a very close second, his plants being a little less crowded than the others, and carrying very fine blooms. There were not many points between the two. Mr. Debnam, gardener to Andrew Pears, Esq., was third with a smaller group, but containing many fine flowers. Mr. Parsons won Sir E. J. D. Pauls' first prize for a basket of plants. Mr. Rickwood, gardener to Lady Freake, was second; and Mr. Marden, gardener to Mrs. Stearns, third. Mr. Attwood won with six untrained Chrysanthemums; Mr. Brill being second, and Mr. Collett third. Mr. Parsons had the best Bouvardias, the plants being large and freely flowered; younger specimens from Mr. C. J. Waite, gardener to Colonel Talbot; and Mr. Garrod, gardener to J. R. Tindale, Esq., being second and third.

Primulas from Mr. Garrod were good, albeit not very varied, and were placed first. Messrs. Rickwood and Burton, gardener to Sir E. Paul, being second and third. Mr. Wilkins, gardener to Mrs. Pearson, showed some beautiful table plants and won readily; but Messrs. Debnam and Sage, who were second and third, also had good material. Mr. Garrod won with Zonal Pelargoniums. Miss Clarke had the best stand of flowers—a pleasing arrangement; Mr. Reeves was second, and Miss Cole third. The latter won with a bouquet, and Mr. Reeves was second. Miss Cole won again with buttonholes and sprays.

The first prize for twenty-four blooms, twelve incurved, twelve Japanese, went to Mr. Waite, whose flowers were of medium size, very fresh, and of good colour. Vivand Morel was very broad in petal amongst the Japanese, and the other flowers were also substantial. The incurved were exceptionally good, the flowers being very smooth and symmetrical; Prince Alfred, Empress of India, Golden Empress, and John Doughty were admirable examples. Mr. Hunt, gardener to P. Ralli, Esq., was second with better Japanese, but much inferior incurved, these being rough. Mr. Woodgate was third with smaller flowers, but the incurved were smooth and good. Mr. Waite won again with twelve incurved, and although the flowers were somewhat small they were smooth, fresh, and well finished. The best were Prince Alfred, Violet Tomlin, and Lord Alcester. Mr. Woodgate was a very good second, his flowers being smooth but rather uneven. Mr. Wilkins was third. Mr. Hunt had a very fine stand of twelve Japanese, the flowers being much too large for the board. Vivand Morel, Mons. Bernard, and Mdlle. M. Hoste were splendid. Mr. Waite was second, J. Woodgate third, these being very close. The latter won with Anemones, having a very fine stand, and also with Pompons, of which he had a charming box. Mr. Garrod was second. With six incurved, one variety, Mr. Waite won, having Violet Tomlin splendidly coloured. Mr. Hunt was second with the same variety, heavier, but paler. Mr. Wilkins was third. Mr. Woodgate won with six Japanese, one variety, showing Etoile de Lyon, and Mr. Hunt was second with Edwin Molyneux. Mr. Fordham, Mr. Tracy, and others exhibited plants not for competition, and there was an extensive display of fruit and vegetables, for particulars of which space cannot be found.

[We have received several other reports of Chrysanthemum Shows, but regret our inability to insert them this week. We, however, desire to thank our correspondents who have kindly favoured us with reports of shows.

HARDY FRUIT GARDEN.

Planting Wall Trees.—In planting wall trees now, doing the work well, and with reasonable expedition in fine weather, there is every reason to expect good results. The soil is now moist, comparatively warm and friable, and the young fibrous roots of fruit trees are just in the condition to make a good start. Late or spring planting, except with well prepared trees, is somewhat risky, the trees requiring more attention in order to encourage a regular growth.

Forms of Trees.—These comprise horizontally trained trees, the best form in a general way for Apples and Pears; standard fan-trained for very high walls, half-standard for medium walls, and dwarf fan-trained for lower walls; also oblique and upright trained cordons, with single and double lateral cordons for low walls. Fan-trained trees are the most generally adopted for stone fruits for one important reason, which is the liability of fruit trees of this class to lose branches, often suddenly and unexpectedly. When this occurs with any other form but the fan-shaped specimens there is a difficulty in filling up the vacant spaces. This can be done with fan-trained trees, as branches can be originated at almost any point, or those that are good re-arranged on the wall. The latter plan is beneficial when growths are rather crowded and need more room.

Distances Between Trees.—Apples on the Crab stock and Pears on the Pear stock should be planted 20 feet apart, but the former on the Paradise stock and the latter on the Quince stock may be planted 12 to 15 feet apart, as growth is not so vigorous. These distances are for horizontally trained trees. Oblique and upright cordons of the same fruits can be planted 2 feet apart. Peaches, Nectarines, and Cherries grown on the fan system should be planted 15 to 20 feet apart; while Apricots and Plums ought to have the greater distance—20 feet.

Age of Trees.—In selecting trees for wall planting give preference to clean, healthy specimens some few years old from the bud or graft. These will have been trained in the nursery for the purpose for which they are wanted. In addition to being carefully trained, such trees have generally a fair amount of fibrous roots through frequent transplanting. They, therefore, lift well, and with care in removal soon obtain a fresh start in their new positions. Avoid, however, obtaining trees of greater age and size, as they are rarely satisfactory.

Preparing Borders.—The borders for fruit trees against walls should be permanently prepared before planting the trees. In some soils and positions artificial drainage is essential. When this is the case every

precaution must be taken to ensure a complete arrangement so that superfluous moisture can find a ready outlet. A good drain 3 to 4 feet deep placed along the front of the border, and connected, with sufficient fall, to some main drain will usually prove ample. The width of borders varies according to the height of the wall, the lateral area which trees are expected to cover, and the stock upon which they are grown. The maximum height of a wall for ordinary fruit trees is 12 feet. When such walls are intended to be covered by trees on the free stock with an area in breadth double their height a border 12 feet wide will ultimately be required. For trees of lesser dimensions, and on dwarfing stocks, borders 6 to 8 feet wide will suffice; while for cordon trees, borders 2 to 4 feet in width, according to the height of the trees, must be afforded. A general depth of 2 to 3 feet is considered ample.

Soil for Wall Trees.—The soil should, as a rule, be fairly rich and strong, loam partaking slightly of a clayey character, but not so as to be tenacious. Apples and Pears will thrive on a soil of this character if it be deeply worked. For stone fruits add lime rubbish broken fine at planting time. Manure may also be added to enrich it, taking care that it is incorporated well with the soil, so that no rank, strong portions can come in contact with the roots of the trees when planted. Poor soil or that of too light and dry character is of little use for fruit culture, especially against walls.

Planting.—When everything is ready for placing the trees in position dig out the holes, making them wide enough to admit roots easily without being curled or twisted. Prune back to good portions all the crushed or injured roots, shortening gross roots considerably, and reducing the strong tap root. Place the bole of the tree fully 3 inches from the wall. In damp situations or in heavy cold soil it is imperative that the roots be raised above the surrounding level in order that a warmer position is afforded so that they can make a more satisfactory growth. Spread all the roots in an outward direction from the walls, carefully fixing and securing them between shallow layers of fine loamy soil mixed with charred refuse from a recent smother. Bury very few of the roots more than 3 or 4 inches deep. When all are carefully covered with the fine compost spread some of the ordinary soil over them to the required depth, and well water the ground to wash the soil closely around them. This is better than treading and stamping, injuring no fibres. In a few days mulch the surface with short littery manure. Only loosely secure the plants to the walls, but not so that they cannot settle along with the soil as it finally subsides.

FRUIT FORCING.

Strawberries in Pots.—All plants for early forcing should be placed in frames, with a view to protect them from severe frost, heavy rains, and snow. Severe frost does the plants no good, but heavy rains and snow often cause the drainage to become much choked. In the frames, and plunged in ashes to the rim of the pots, the plants are quite safe, only take care not to let any become and remain dry at the roots, to use the lights only when heavy rains prevail, and then with them tilted at the back, and closed when snow or frost happens, otherwise drawing off the lights. If protection, as that of mats, is given in severe weather, the plants can be removed at any time as required for forcing. One of the commonest and worst practices is to pile the pots—plants outward—in a sort of half cone against a wall, packing them in sawdust, leaves, or soil, and the consequence is they are frozen through and the roots injured, whilst not a few suffer from drought, as they are practically unavailable for watering. A greater mistake is made in placing the plants on the border of a Peach house with open ventilators, where the currents of air being constant and excessive provoke evaporation that simply wastes the energies of the plants, and mostly destroys the roots at the sides of the pots. It is a far better plan to stand the pots on a foundation of ashes in a sheltered situation, and surround them with ashes level with the rim of the pots, affording them a light covering of straw or bracken in severe weather. This answers very well for midseason and late forcing plants, they being removeable at any time and take no harm, only if frozen they must be thawed in a house not much above freezing point.

Where there is the convenience of a Strawberry house and fruit is required early—say in late February or early March—a batch of plants may now be introduced, placing them on shelves near the glass, and only employing fire heat to exclude frost at night, and to maintain a temperature of 50° by day, at and above which ventilate freely. The plants forming this batch should be the earliest matured, with well formed crowns, and of the most approved early forcing varieties, as John Ruskin, La Grosse Sucrée, and Vicomtesse Hericart de Thury. The first named has all the characteristics of the old Black Prince, except that it is bigger and better, and not so liable to mildew, which often ruins the crop of forced Black Prince. The mildew almost always appears with the flowers, and then gets a hold on the fruit. Early treatment with bi-sulphide of calcium is an effective preventive. It may be made as follows:—Slake 1 lb. of freshly burned lime, add half a pound of flowers of sulphur and enough water to form a paste, then add one gallon of water, and boil fifteen minutes. It should be kept constantly stirred while it is boiling, then allowed to settle, and when cool pour off the clear liquid into a stone bottle, and keep well corked. For use add half a gill to a three-gallon waterpotful of water, and wet every part of the plants by spraying or dipping them in the solution just before the trusses start from the crown, and repeat before the flowers open, and again when the fruit is set. The mildew that infests Strawberries seems to be proof against dry sulphur—besides, flowers of sulphur dusted on Strawberries after they set is almost as bad as the

disease. This fungus (*Oidium Balsami*) has a penchant for some varieties or types of Strawberries—namely, Black Prince, Pioneer, and Sir Joseph Paxton, as La Grosse Sucrée and Vicomtesse Hericart de Thury mostly are free from it, whilst it runs riot on Black Prince in the same house.

Where there is convenience it is a great aid in early forcing to afford the plants the benefit of a slight warmth at the roots by making up a bed of leaves about 2 feet in height, placing the plants in a frame or house upon it, packing the space between the pots with damp leaves. The bottom heat at the base of the pots should be 65°, the top being kept cool, 50° not being exceeded, and when mild draw off the lights. This will promote activity at the roots, and the crowns will push little or nothing, yet the plants after a month of this treatment—the bed then being cool or the pots withdrawn in preparation for removal to a vinery just being started—will go right away without having the leaves drawn or the trusses weakened by being placed direct from cool quarters in a house almost warm enough when started for the Strawberry when in flower. In fact, plants with well developed crowns and abundant roots do not always succeed in a vinery because they are brought into flower too rapidly, but treated in the manner advised excellent fruit of La Grosse Sucrée may be had in March from a vinery started at the new year.

KITCHEN GARDEN.

Rhubarb.—This invariably forces the most readily after the roots or clumps have been exposed to a severe frost, slightly baring for a few days in frosty weather those to be lifted being a good preparatory measure. In most instances frosts cut down the leaves early, and a good rest has thereby been enforced. Strong clumps of the early forms such as Prince Albert, Johnstone's, St. Martins, and Paragon, may, therefore, be either forced where they are by means of deep tubs or boxes, and heating material, as advised in the case of Seakale, or better still they may be lifted and forced in either Mushroom houses, heated pits, or under the stagings in forcing houses. The best stalks are obtained in the former place, but they can be had more quickly in stronger heat if care is taken to guard against extreme dryness and also to well darken the crowns.

Globe Artichokes.—The growth of these has been very vigorous and sustained later than usual. At no time are the plants really hardy, and in all probability are more likely to be injured by severe frosts this winter than they were last year. A heavy mulching of strawy litter is one of the best protections that can be afforded, this being banked up well around the stalks of the leaves. The latter will most probably be killed down to the litter, but the crowns will escape and strong early growths or flower stems result next season. Failing strawy litter substitute ashes. Leaves are of little service unless heavily surfaced over with strawy litter or soil to prevent them blowing away.

Autumn Broccoli.—Veitch's Autumn Protecting is not particularly hardy, and the same may be said of other varieties now being cut. It is not sufficient to merely tuck two or three leaves over the hearts as they form, this only saving the latter from moderately severe frosts. The better course to pursue is to lift a considerable portion of the later plants, or any only just commencing to form hearts, with a ball of soil and roots attached and to replant them under cover. Deep glazed pits, and the beds or pits in cool vineries, are good places for storing Broccoli, the roots being surrounded with rich moist soil. They may be bedded in rather thickly, and, if kept moderately cool, and the roots in a moist state, good sized very white hearts will form, the supply lasting for several weeks. In the event of severe frosts being anticipated lift the more forward plants as well, and store these either in a shed or where they can be well protected with mats and litter. Late Cauliflowers are still to be had, and these ought now to be treated in the matter of storing and protecting similarly to the early Broccoli.

THE BEE-KEEPER.

APIARIAN NOTES.

THE WEATHER.

SINCE the 2nd of November, the date when the severe frosts for the season left us, the weather has been showery, mild, and genial, with more sunshine than we had in the same space of time during any of the summer months. Colchicums are still pretty, Wallflowers and Arabis are reviving. Chrysanthemums have recuscitated, and are bright with flowers. The same may be said of the Marguerites, while single and double Hepaticas, Primroses, Christmas Roses, double scarlet Geums, Achillea tomentosa, &c., adorn our borders and attract our bees. Numbers of them are carrying pollen from the newly opened flowers.

BLUE TITMICE.

These scourgers of Currant and Gooseberry bushes and devourers of bees, which as a rule begin their depredations on the 1st of November, have not as yet made an appearance. To protect our Currant bushes I take a smooth rope, double it, and draw the bush together tightly, then tie the ends together. This plan I learned long ago from the *Cottage Gardener*. I then take some of the

decayed annuals and hang them over the bushes, for affording protection. This secures a good crop, whereas without the little care the crop would be nil.

WINTER FEEDING.

No food keeps bees so well in winter as the best refined cane sugar. It is positively injurious to allow bees to winter on some kinds of honey, particularly Heather honey; but it is by far the best for spring. The Carniolan hive referred to lately took up food from below during the severest weather and sealed nicely. Fourteen pounds of sugar dissolved in an equal weight of water were taken more quickly than 4 lbs. from one of my best top feeders, both feeders employed at the same time. Unless in extreme cases candy should not be given to bees. When bees take sugar they seal it; the idea that they do not is mere imagination.

MANAGEMENT OF HIVES FOR EARLY WORK.

Premising that bee-keepers have so managed their hives during autumn and winter as to be in a good condition, and the brood well forward about three weeks before the first honey flow, or about the time our hives begin to swarm, select the most forward hive to strengthen advanced ones. Never waste bees or brood upon weak stocks, nor, at least till you are master of the art of bee management, add one colony to another. In many cases of supposed successful uniting the bee-keeper is apt to deceive himself, the bees showing no signs of killing each other for some time after the operation; but if the bee-keeper go to the hives after dark he will to his surprise, if not mortification, hear and see them leaving the hive in a wounded state in rapid succession, and if the hive be examined next day no more bees will be seen than the original ones. Bees do strange things at times, and not unfrequently kill off a portion of their own stock for some reason or other I cannot understand. The hives to be strengthened must not only be strong but be of full size, so that there will, with the hatching of its own and introduced brood, be ample space for the queen to deposit 4000 eggs daily. It is desirable that all the good from a prolific queen be taken at the proper time, and that necessitates a large hive. It is of no use keeping two queens in one hive that one queen can fill with eggs, nor joining brood to a small hive when the object is to gather honey.

One good hive is sufficient to strengthen three other strong hives, but the bee-keeper may have to modify the distribution more or less according to his judgment. One caution is necessary, be quite sure there is no foul brood.

The bees deprived of their combs may be treated as a prime swarm or for the purpose of raising queens to be ready to introduce to any hive that may swarm. There is as yet no plan devised that will prevent swarming, but introducing a young fertile queen with ample space in the hive for her enormous egg production will have effect.

Super in time to delay swarming, but on no account after the bees are determined to raise royal cells attempt preventing it by cutting out queen cells or anything else, or you will be disappointed.

Swarms contain the majority of the working bees, and work much better than any unswarmed stock, while all the honey gathered is stored in combs of the greatest purity.—A LANARKSHIRE BEE-KEEPER.

TO CORRESPONDENTS

* All correspondence should be directed either to "THE EDITOR" or to "THE PUBLISHER." Letters addressed to Dr. Hogg or members of the staff often remain unopened unavoidably. We request that no one will write privately to any of our correspondents, as doing so subjects them to unjustifiable trouble and expense.

Correspondents should not mix up on the same sheet questions relating to Gardening and those on Bee subjects, and should never send more than two or three questions at once. All articles intended for insertion should be written on one side of the paper only. We cannot reply to questions through the post, and we do not undertake to return rejected communications.

Croydon Chrysanthemum Show (*Inquirer*).—As the officials neither advertised the Show nor sent the usual press tickets to this office we concluded that a report was not desired in the *Journal of Horticulture*.

Apples in Wet Land (L. F.).—Your orchard probably needs draining. We have seen Bramley's Seedling Apple free from canker when growing in an Osier bed and bearing excellent crops of fine fruits. As dessert Apples we have found both King of the Pippins and Wyken Pippin to answer as well as any in a damp situation. The last-named variety is one of the latest and is very good.

Arrangement of Peach Trellises (S. J. A.).—In large and lefty structures the cross trellis system answers very well, more fruit being had probably than in any other way, but the colour is not so good as when grown under more direct exposure to sun on the ordinary arched trellis and unshaded walls. We have many times stated that Mr. Iggulden's "Tomato Manual" can be obtained from this office post free for 1s. 1½d.

The Silver Tree (F. B.).—The plant of which you sent a leaf is a member of the natural order Proteaceæ, and is known to botanists as *Leucadendron argenteum*. It is a native of the Cape of Good Hope, where it is known to the Dutch colonists as Witteboom, or Silver Tree, a name which it owes to the silvery appearance of the leaves. The plant is in cultivation, and may be seen at Kew and in a few other establishments where large collections of old and curious plants are grown. It was introduced towards the close of the seventeenth century, so that it is by no means a novelty. Leaves are imported for decorative purposes with the Cape Everlasting Flowers, and may be frequently seen in Covent Garden Market. A figure of the plant was published in the "Botanical Register" in 1826, but it does not show the peculiar whiteness of the foliage.

Upper Branches of Peach Tree Dying (Nemo).—It is not unusual for Peach and Nectarine trees to lose the upper branches where the soil is gravelly, through the long-jointed and immature nature of the growths. The only remedy is lifting, shortening the long and strong roots, and laying them in firm soil near the surface. This should be attended to as soon as the leaves are mature and have commenced falling. If the soil is very open it would be desirable to supply some stronger loam, or preferably clay marl, dried, pounded, and well mixed with the soil to a depth of 18 inches. In lifting particular care should be taken of the fibry roots, and all should be spread out evenly in the top 6 or 9 inches of soil, so as to insure surface rootage, and the roots should be encouraged to multiply there by light mulchings of short manure, and copious watering in dry weather. Make the soil firm so as to induce a sturdy thoroughly solidified growth, and it will not die back.

Alicante Grapes Coated with Honeydew (Honeydew).—Honeydew is not a disease, and is seldom occasioned by anything but insects. Only two or three parasites that we are aware of produce honeydew on Grapes. The worst is mealy bug, but we cannot account for the Grapes being satisfactory "in the vinery and on the table until the foliage begun to ripen." As you do not know the cause nor the cure we cannot assist you to "an idea" without particulars or a specimen of the Grapes. What little information is given leads us to infer that the Vines are attacked by mealy bug. The latter, however, would show on the leaves or Grapes before they were ripe, though its secretions might not be so pronounced as to render the Grapes not fit for table till the foliage was ripening. That we surmise is the case, as this, the most loathsome of insect pests, infests the Vine and renders the Grapes useless for table. The other most prevalent pest causing honeydew is scale; it is not half so bad as mealy bug, and can only exist where proper measures are not taken to prevent its attacks. Yellow thrips also disfigure the bunches, but is somewhat uncommon.

The Use of Milfoils (A. M. C.).—The Milfoils contain an essential oil and a bitter resinous substance. The Common Milfoil (*Achillea millefolium*) or Yarrow possesses these properties in as great a degree as any of the species. It is, as you may have observed, very common in pastures and by roadsides in this country, and was long considered as a noxious weed; but of late years it has been recommended in mixtures of artificial grasses for permanent pasture. The whole plant is medicinal. Both the flowers and leaves have an agreeable, though feeble, aromatic odour, which continues after drying, and a bitter, astringent, pungent taste. The aromatic properties are strongest in the flowers, the bitter in the leaves. The virtues are owing to a volatile oil, a bitter extractive, and tannin. It contains also a peculiar acid, called achilleic acid. The oil is obtained by distillation, and is of a beautiful azure blue colour, with the peculiar flavour of milfoil. In former times the plant was greatly esteemed as a vulnerary, and it is still esteemed as a mild aromatic tonic and stimulant. In the province of Dalecarlia, in Sweden, the inhabitants use it in the making of beer as a substitute for Hops, in order to increase its intoxicating powers. The Scotch Highlanders make an ointment of it, which dries and heals wounds. *A. ageratum* is the Sweet Maudlin, and grows abundantly in the south of Europe. It has a sweet smell and a bitter, aromatic taste; but though at one time regarded as medicinal, it is not now considered to possess any properties worthy of notice. *P. armica vulgaris*, or Sneezewort, is also a native of Britain, growing in moist meadows, by the sides of ditches, and in shady woods. The plant is slightly odorous; the taste of its leaves is feebly aromatic and somewhat acrid, having a resemblance to that of Tarragon. Its roots and leaves, dried and reduced to powder, are frequently employed, like snuff, to excite sneezing, and its root, when bruised, acts on the salivary glands, and has been applied in cases of toothache. The young, tender shoots are put into salads to correct their coldness. *P. nana* and *P. atrata* are substituted for the true genipi, which is *P. moschata*; but all are used by the Swiss mountaineers as tea, and the last particularly is esteemed as an excellent sudorific, and as furnishing the liqueur *Esprit d'Iva*.

Names of Fruits.—Notice.—Special attention is directed to the following decision, the object of which is to discourage the growth of inferior and promote the culture of superior varieties. In consequence of the large number of worthless Apples and Pears sent to this office to be named, it has been decided to name only specimens and varieties of approved merit, and to reject the inferior, which are not worth sending or growing. The names and addresses of senders of fruit to be named must in all cases be enclosed with the specimens, whether letters referring to the fruit are sent by post or not. The names are not necessarily required for publication, initials sufficing for that. Only six specimens can be named at once, and any beyond that number cannot be preserved. (*F. Danberry*).—Nos. 2 and 3 are Marie Louise; 4, undeveloped; 5, Yellow Ingestrie; 6, Court of Wick. There are no numbers on the others. (*J. J.*).—1 and 2, Scarlet Nonpareil; 3, Damelow's Seedling; 4, Beurré Diel. (*W. W. C.*).—1, Beauty of Hants; 3, Old Pomcroy; 4, Hoary Morning; 5, Clifton Noncuch; 6, Adams' Pearmain. (*F. J. G.*).—1, Cellini; 2, Gloria Mundi; 4, Ribston Pippin. (*T. Steven*).—You are in error; we did not name No. 4 Golden Knob. No. 1 now sent is Golden Knob; 2, Cox's Orange Pippin; No. 4, Birmingham Pippin. The No. 4 sent last week was a Pear, and as such duly named.

Names of Plants.—We only undertake to name species of plants, not varieties that have originated from seed and termed florists' flowers. Flowering specimens are necessary of flowering plants, and Fern fronds should bear spores. Specimens should arrive in a fresh state in firm boxes. Slightly damp moss, soft green grass or leaves form the best packing, dry wool the worst. Not more than six specimens can be named at once, and the numbers should be visible without untying the ligatures, it being often difficult to separate them when the paper is damp. (*Gifford*).—1, *Dichorandra undata*; 2, *Correa alba*; 3, A florist's variety of *Coleus*; 4, *Sonerila margaritacea*; 5, *Ophiopogon Jaburan variegatum*.

WHEAT SOWING.

NOVEMBER Wheat sowing should be done in the ordinary rotation of farm management, only on what is termed Turnip land, which is land whereon sheep have been folded to consume a crop of white Turnips, say during the last six or eight weeks. It is sound practice to finish strong forward hoggets in this way, giving them crushed oats in the troughs—say a pint per head per day, or even twice that quantity for exceptionally large framed sheep. It is obvious that a Suffolk consumes more than a South Down, and a Kent or Lincoln more than a Suffolk. We give a safe general quantity, and the home farmer must use some discretion as to increasing or reducing it. For such late sowing the Turnips should be sown on really sound deep mixed soil, which is precisely the best of all land for Wheat, and is from its deep tilth, fine firm seed bed, and ease of culture about the only land on which we care to sow Wheat now. If Wheat growing in this country were confined to such land for late sowing, and to heavy land for the early general sowings in September and October, the average yield would rise to 40 bushels. When we get that as an average, and at least 8 bushels more per acre under special treatment, Wheat growing will have once more taken its right place in the economy of farm management, and though not so profitable as of yore—it can never be that again without a war and disruption of our traffic—it will be grown at a profit at any rate.

The deplorable persistence of so many farmers to go on sowing Wheat late in winter, frequently without any special care in the selection or preparation of the soil, not only keeps down the yield average, but makes the farmer a poor man. If he persists in such stupid practice, and comes crying for aid in the form of rent reduction, he should be made to understand in very plain language that he must either alter or leave his farm. Hard measure? Certainly not. Hard for the landlord if you will, to have to suffer for the stupidity and stubbornness of such a tenant. Surely we may claim that it is the duty as well as the interest of every tiller of the soil to till and sow in a manner to give him reasonable expectation of a profit—a fair return upon his work. It is not doing so when a poor weedy stubble is ploughed in November or December and sown with Wheat.

Sheep folds we have shown again and again are one of the very best forms of imparting fertility to land. There can be no doubt that the farmyard manure used for a root crop does much good to the corn crop which follows—probably more good than it did to the roots. The common mistake is in using so little of it and nothing else in ploughing in a miserable half-dressing now for the Wheat. But even that would not be so bad if only it were supplemented by a top-dressing of 1 or 2 cwt. per acre of nitrate of soda in spring when the plant is growing freely, and when it is quickly dissolved by April showers. Nothing in farming is so speedy in action, so marked in effect, so profitable in results. The effect of such top-dressings to all growing crops, but especially of Wheat, has well been described as “wonderful.” Not only is growth marvellously accelerated, but the crop is frequently doubled, so that by the expenditure of about £1 per acre we get corn worth £2 or £3 per acre than would otherwise be possible. We achieve success where failure was so possible, in striking contrast to the lamentable results of those who continue regarding nitrate of soda as a scourge of the soil. How strange! Here we have one of the greatest boons that has ever come to the farmer, positively regarded by him as an evil, a source of harm to his land, a waste of his means. The ignorant just follow the lead of those of greater ignorance, who, are outspoken in their blind dislike of “niter-soda” without test-

ing the matter most carefully for themselves. Only get plenty of mineral manure in the land and the nitrate may be used with a free hand to very great advantage.

To those, then, whose work is in arrear, and who intend sowing Wheat some time or other during winter, we say, Be cautious, and unless you have exceptional advantages of soil sow only enough for home requirements. Far better to do this, ploughing the remainder of the land intended for Wheat, and then wait till spring for a crop of Oats. Be on the alert to obtain enough of the best seed Oats, preferably Black Tartarian, short, thick, heavy grain; give the land a full dressing of manure, consisting of say 3 or 4 cwt. of superphosphate and half that quantity of nitrate of soda, and see if you cannot obtain 80 or 90 bushels of grain per acre, as well as some big stacks of excellent fodder for your live stock. The quantity of Oats per acre is well within bounds, but is far above the ordinary average, and is only to be had on land rich in fertility. Such a crop is much more profitable than any Wheat crop could be from late sowings on poor or badly tilled land.

WORK ON THE HOME FARM.

Most of the fat beasts grazed on marsh land have been sold, and though prices were low, yet on the whole they have afforded us some profit. This is noteworthy at a time when every weekly market gives rise to complaints of heavy losses upon cattle. We can only repeat our advice to every farmer and grazier to clear off his surplus stock, and to set himself seriously to see which animals ought to be regarded as coming under that comprehensive designation. With dairy cows, the home farmer's aim is to keep them in as healthy and fresh condition as he can throughout winter, to have a cow or two calving from the present time onwards till spring or summer. In connection with this herd there must always be in calf heifers, yearlings, and calves, to come into it to fill any vacancies from losses or take the place of worn-out cows. Then for grazing there should be the home-bred steers of from twelve to eighteen months old, with calves of the current year to follow. For every one of them there must be an adequate provision of food and shelter till “turn out time,” which may be by the end of next March, or not till late in May. Let this be well thought out, and a sufficient provision of food made or kept for all possible requirements, and to allow a liberal surplus.

In this matter there must be no foolish parsimonious pinching. Economy here means keeping the whole of the live stock in a healthy fresh condition. The term of “fresh” is familiar to all graziers, carrying with it the meaning of a really fleshy well-nourished animal that is not fat, but which may very soon be made so. Well, now, compare such a lot of animals with the half-starved neglected cattle of the ordinary farm in winter. Many a farm do we know where the cattle have no other shelter than the pasture hedges, where they are on such short commons in winter that every scrap of “fog,” be it green or brown, is eaten up, and which by spring time are in very low condition, so low that it requires months of fair grazing to get some flesh upon the prominent ribs. How can it reasonably be expected that such ill-treated, mismanaged animals can pay? Therefore, we say, Sell surplus stock at any sacrifice rather than keep it till spring. Take all possible care of those which are kept, so that no point of detail, nothing affecting health or comfort, is neglected. Most disgraceful is the condition of many cows in spring after being wintered in stalls and suffered to lie down in filth till their coats are clotted with it.

REMARKS.

- 6th.—Rain early and at 10.30 A.M.; generally sunny after 11 A.M.
 7th.—Misty early; bright sunshine from 9.30 A.M.; foggy towards sunset and in the evening.
 8th.—Fog more or less all day; generally dense in morning, very slight after 4 P.M.
 9th.—Slight fog till about 10 A.M., overcast after.
 10th.—Fog more or less all day; dense at times in the morning.
 11th.—Overcast throughout.
 12th.—Clear at times, but very dark, with high fog from 10 to 11 A.M., and 1.30 to 3 P.M.

A dull and foggy week with little range of temperature.—G. J. SYMONS.

MR. IGGULDEN did well last week to direct attention to the great demand for stewed Pears, and to the enormous importations of them in the form of canned fruit from abroad to meet the requirements of our population at home. From the circumstances of the case he draws sensible deductions. He is not satisfied that fruit growers in this country should rest content in allowing other lands to enjoy the monopoly of supplying our markets with preserved Pears that are no better when gathered than the produce of British gardens. He would like to see his countrymen not only share in the trade, but excel in it; and he foresees that if the best methods of preserving Pears are ascertained and adopted, and clear glass bottles are employed for storing, instead of the less wholesome cans, that a new industry may be established. Given fruit of equal value packed in tins with a picture on them, and the contents of necessity hidden, on the one hand; and in clear glass bottles with the produce visible on the other, there is little doubt which the public would choose. The great majority would, unquestionably, prefer the latter. Home-grown fruit, such as Plums, Gooseberries, and other soft kinds preserved and sold in bottles, is far superior to any imported in cans, sells more freely and at higher prices, while there is a growing export trade. If this is so, as it is in respect to these fruits, it is difficult to see why the practice cannot be extended to Pears. Bottled produce, if of the first quality, and not higher in price than imported canned goods, as it ought not to be, would not be long in commanding the market, and our correspondent's hope for a "new industry" would be realised.

We now turn to what may be described as an "old industry," in the drying of fruit. That Apples and Plums can be dried by the process of evaporation as well in this kingdom as any other has been demonstrated at Chiswick this year. The Apple rings and chips dried there by the Mayfarth apparatus were equal to any that could be purchased in shops, from wheresoever they came. Yet of the hundreds of thousands of lbs. sold in London and other centres of population it would be difficult to find even 1 lb. of home-grown and home-dried fruit. Some of the Plums dried at Chiswick have also been as good as the most fastidious could desire after the fruit has been duly soaked and prepared for table. The cost of the drying at Chiswick and the value of the produce show also that the work is profitable. Five bushels of fresh Apples can be pared, cored, sliced, and dried in a day by one man, the expenditure on fuel only amounting to 9d. On a large scale in America the cost of drying a bushel of fruit is 6d. to 7d., the dried produce selling for 2s., a little more or less according to quality. At Chiswick Apples are dried in three hours in a temperature of 150° to 200°; Plums in seven to eight hours, temperature 200° to 225°. For preparing for use the dried fruit requires to be soaked about the same time as is needed for drying. Nothing but water is driven out, all the constituents of the fruit beyond that being retained; and when the water is absorbed by soaking, the fruit is nearly the same in bulk as if the fruit were fresh when cooked and quite as good in quality.

As indicating the extent of fruit drying in America we cite from Mr. Pridgeon's report in the Journal of the Royal Agricultural Society. In one year 31,450,000 lbs. of fruit were dried in California, value £431,590. Much of this bulk would be Plums

converted into prunes, vast quantities of which are sun-dried. In the same year (1888) 37,750,000 lbs. of fruit were dried in evaporators in the State of New York, all but 750,000 being Apples, value of produce £297,000, or a total of 69,200,000 lbs. of fruit in two States in one year of the value of £728,590. Most of this fruit is sent to Europe. In Germany and France a great deal of fruit is dried, especially Plums, but practically none in England.

It may be urged, however, that the fruit-drying referred to cannot be regarded as an "old industry." It cannot so far as regards the work in America. It is there modern—nineteenth century work, in which trade enterprise and business acumen are displayed in a remarkable manner; but on the European continent the drying of Plums is an ancient art, still in progress, and was once commonly practised in England. In the former countries both as a commercial undertaking and a domestic duty; in our counties in a domestic manner exclusively. It is therefore an old industry fallen into disuetude with us, and might with advantage to many families be revived. Mr. Philip Crowley, Treasurer to the Royal Horticultural Society and Chairman of the Fruit Committee, has shown the way—a cheap way too, as he dries his Plums—makes his prunes—at a cost of nothing for fuel, and the most "enterprising" of our friends across the sea cannot easily beat that for economy.

Mr. Crowley placed some of his Plums on the table of the Fruit Committee at Westminster last week, the variety being Rivers' Prolific. Though of excellent quality this Plum is too small for drying; or in other words, there was too little flesh and too much stone; but fruits of Rivers' Monarch dried in the oven and tested at Mr. Crowley's table were in every respect as good as could be desired, and quite equal to the best French cooking prunes. The following is Mr. Crowley's description of his experiments:—

"Ever since I saw Plums dried at Chiswick I have tried some at home. Last year I laid them on cardboard in the usual iron oven tray, but then they were too caramelised and tasted burnt. This year I made some wooden frames to fit the oven and formed trays of galvanised iron wire half-inch netting, and on this laid the Plums. This allowed the air to circulate freely between and under the fruit. When the cooking for the day was done and the oven was a reasonable heat these trays were put in and the door left a little open to help the current of air to pass through, and the fruit left there until the oven became too hot the following morning. This was repeated three or four nights, with the result of having good dried Plums at no expense and no bother. Anyone with a surplus of Plums and a kitchen oven may do the same. We found one lot was not sufficiently dried and began to mould; these we put in again for a night and saved, but with a little care, of course, one knows how dry to make them. I have also done Apples in the usual ring very successfully."

In France, Germany, and Switzerland it is a regular practice for householders to dry their own Plums in ovens or on trays over fires, and, as was stated last week by Mr. Wilks and Mr. Bunyard, the custom was somewhat general in Kent a generation or two ago. It probably ceased as the French and German prunes were found to be better. They were better simply because the varieties—the Quetsche in Germany and the D'Agen in France—were better adapted for the process by their firm flesh and thick skins than the varieties that happened to be grown in home orchards. But we have varieties that are equally suitable for use in a fresh state and for drying. The valuable rather late Plum previously mentioned (Rivers' Monarch) is one of them, and the more it is becoming known the more extensively is it being planted.

At Chiswick the variety Fellemberg gave the best results. This is the Plum the Italians use for drying, and it is described in the "Fruit Manual" under the name of "Italian Prune." It is a large, dark, oval fruit with firm flesh; good for dessert and preserving, and hangs till it shrivels. The Diamond, one of our best cooking Plums, also dries well, but the soft-fleshed and tender-

skinned sorts, such as Victoria and others of that type, do not. Dark Plums are much more tempting in appearance when dried than green or light varieties; but whatever the colour, the fruit should be large, firm in the flesh, and stout in the skin.

It is important, too, that the fruits be perfectly sound, as if any are bruised the juice escapes, and this passing to the sound fruits seals the pores, preventing the escape of the water from them by evaporation, and consequently the fruits split under the action of heat and are spoiled.

As all know, bountiful fruit years, in which Plums and Apples are over-abundant, are commonly followed by years of scarcity; and it is well to know also that by drying surplus produce in a domestic way for home use and on a large scale by the "May-farth" for town populations, that plenty of Apples and Plums may be had for cooking during seasons when few or none grow on the trees. But, apart from that, the consumption of dried fruit is enormous, no matter how good our fruit crops may be; and, as both Apples and Plums can be dried in this country as well and as cheaply as in any other, it is for those who can provide the fruit and the means for dealing with it to consider how long it will be prudent to remain passive and allow the enterprising growers and merchants in other lands to monopolise this great industry and derive profit, as they must do largely at our expense.

SEASONABLE HINTS ON FLORISTS' FLOWERS.

THE very varying character of our climate seriously modifies from year to year the treatment of the various productions of our garden, and what may be fitting for the same class of flowers in one year is totally unsuited for it in the following one; and although we are continually saying that we have had an extraordinary season, I think it is only another way of saying that there is no accounting for our climate. But this is an extraordinary season, at least in my part of the country (East Kent). We had in the month of October 7.45 of rain, which fell on twenty days, the highest rainfall being on the 4th—2.14; while on the first six days of November we had 1.35. In such a state of things what is to be done? Land is unploughed, and consequently unsown. In my own garden I have neither planted a Rose nor lifted my Gladioli. I believe it is the same with all my neighbours. There is no question of covering up our frames, &c. Whether the frost will soon come we do not know, of course; but at present we have escaped any severe attack of it.

AURICULAS.

As far as my own small collection is concerned I may say these plants have had a good time of it. Where frames and houses are watertight the cool damp weather has suited them, and I have had but little autumn blooming, but I hear from my good friend Miss Woodhead that they have been troubled with it, showing how little we can account for it, for one would have thought in the far north (Yorkshire) they would have had less of it than we further south. The chief points to be looked at now are pulling off the outside dead leaves and to keep the houses, pits or frames where they are wintering well aired and ventilated both night and day. Of course unless the weather changes only a slight covering at night, if any, will be necessary. Much as I love this flower, and much as it fascinates those who do admire it, I do not believe it will ever be popular. It is a flower for the select few, and one has only to listen to the remarks of visitors at one of the Auricula shows to be assured that this is the case.

CARNATIONS AND PICOTEEES.

These flowers, on the other hand, are likely to become more and more popular; their beauty and variety, the ease with which many of them are cultivated, their delicious fragrance, their prodigality of flowers will, I am persuaded, win for them an increased amount of public favour. The many-headed multitude can admire them, although they may pass by the Auricula as stiff, formal, and quaint looking. I think that most people now have given up the notion of wintering them in the open ground, unless in the case of the old stools, which may be so treated; but all the varieties, whether of the old florist type or the selfs and border flowers, are much better wintered in pots, either singly or in pairs. In such a season as this these will require but little attention. Great care must be taken, however, on one point—that they do not get too damp; in fact, they require but little watering, and must have plenty of air at all times. Should spot appear on any of the leaves the leaf ought at once to be picked off, as it very soon spreads to others. It may be, if the weather be mild, that aphides may appear; in that case they had better be brushed off with a camel's-hair pencil

or the frames fumigated. It is well, too, occasionally to stir the surface of the soil in the pots.

GLADIOLI.

The wet season has completely prevented anything being done in lifting these, and it is here, as I have always maintained, that the French growers have the pull over us. It is rarely ever that they do not ripen in the open air at Fontainebleau the Muscadine Grape, which is so largely grown there under the name of Chasselas de Fontainebleau, a feat which would be utterly impossible even in our most favoured localities, and this must, of course, help the ripening of the Gladioli bulbs; and therefore, whatever their condition may be for this year, I cannot but think there is a gloomy prospect for next season. The bulbs must be saturated with wet; this will enfeeble their constitution, and make them a ready prey to fungus or disease. Every year I grow them the more they puzzle me. I have never known an amateur who has not had his bad quarter of an hour over them, and thus the lifting of large, handsome looking bulbs is no indication that they are going to be a success next year. I have, as usual, lost a large number this year, and intend, if I plant any more, to put them in an entirely different part of my garden. I would again urge upon all growers to save their spawn and sow it next spring. It is the only way, I am persuaded, to keep up your stock, and comparatively small bulbs will give good spikes of flowers. They should be kept in dry sand in paper bags or boxes, which should be carefully labelled; but, as in many other flowers, the standard of excellence is becoming higher, and many of our cherished varieties will have to give place to others.

DAHLIAS.

The taking up and putting away in a dry place free from frost of the tubers will be the only point to be attended to. I may say that I have been greatly pleased with Mr. Girdlestone's Tom Thumb single varieties, sent out by Messrs. Cheal & Sons.

PANSIES.

It has been a good season for these in the South of England, which usually does not suit them. I do not, however, advise them to be left out. I have already taken up and potted mine, for even though I grow them in pots I always plant them out in a shady place in the summer; they are now placed in a frame, where they will remain all the winter, and be potted off in the spring.

ROSES.

It has been a quiet season for the queen of flowers, which has received but poor treatment from the weather, so that October planting has been an impossibility. One of our most successful exhibitors told me that he had moved many in his own garden and planted them in September, but this could only be done where they had simply to be transferred from one place in the garden to another, and not packed up and sent off a distance; in fact nurserymen have had a difficulty in executing their orders owing to the condition of the soil. The very copious directions given in your columns from time to time by many of your correspondents renders it unnecessary for me to add anything on the subject of planting. Plant firmly, stake well, and avoid placing manure so as to come in contact with the roots, are things that ought to be attended to.

TULIPS.

These are flowers which are never likely to regain the popularity they once enjoyed. Brilliant as they are they have no perfume, and they are about the worst flowers we have for cutting, and hence they do not please ladies, who naturally look for something for the adornment of their homes. There are, however, some who still admire them. The 20th of November used to be considered the orthodox time for planting them, and it seems as if this would be about the time for them this year if we do not get more rain, and surely it cannot rain for ever. I have the bigotry of an old florist, and although I never went in for them regularly as for other flowers, I know something about them; so much so that the so-called Darwin varieties, which scoff at all florists' rules, find no favour in my eyes.

There is one hint which I think may be given on any of the above flowers—viz., that now is the best time to obtain new varieties, or to make additions to those the grower already possesses. In Auriculas this is not easy, for the new varieties are not to be had, and there are few growers for sale; but in the others it is easy to obtain new varieties or first-class old ones, and it is better to have them under one's own eye during the winter than to trust to the spring, when perhaps in reply to your order you may be told of those you have most set your heart upon, Sold out.—D., Deal.

THE NEW INDUSTRY: BOTTLING PEARS.

THE fruit industry in our own country is indebted to Mr. Iggulden for his suggestions as to bottling Pears. Anyone who can help us to depend on ourselves and not on the outer world, even though they be colonists, is conferring a benefit on our little island and its industries. It may be a "tight little island," and there is no doubt about the tightness of the landed interest just at present. Though canned or bottled fruits cannot make up for corn in case of war, yet whilst we are at peace and corn is an unprofitable product, much may be done by way of fruit-growing as a help to pay our way, and so keep money in the country instead of sending it away.

Mr. Iggulden is quite right. Stewed Pears are popular, and deservedly so. They form a very pretty dish faintly tinted with cochineal, and they are decidedly grateful to the palate. I fancy all coarse Pears will do well for the purpose—Beurré Diel certainly will. In former years, when living in rather an elevated part of Somersetshire, I grew very fine specimens on a south wall, but they never were eatable in a raw state. Fortunately a happy moment suggested stewing, and henceforth while there that was the purpose to which this Pear, ironically styled "Beurré," as it appears to me, was always devoted. Thus treated its shape is favourable as it is comely in form, and looks handsome on a dish. Coming hither to my new abode, in a warmer part of the county I hope, I went round the garden with the gardener, who had been renting it, and asked what he knew about the trees. I noticed a large standard Pear, the fruit unshapely, like a very deformed Bishop's Thumb. "What is that?" I asked. "Oh! it's a Pear." "Yes," said I, "I can see that; but what sort is it?" Oh! he did not know, but "it wasn't no good for anything." Not being very large, the idea of stewing these did not at first occur to me, but as they lay about the inspiration came, and quickly being put to the test, I soon had the rest picked and stored for use. They might not do for every dinner-table for guests, but they do for me, and few who taste despise the dish.

There is always some difficulty as to bottling. For successful keeping it always appears to me that the contents should be tied down when nearly at boiling point. In tins of meat this is so managed, only a trace of air at high temperature being in the tins. Thus closed the pressure of the atmosphere as cooling goes on presses down the tin in a hollow, and if no damage happen, as by a stray nail accidentally driven in, the contents remain sound indefinitely. Bottling, however, is not so easy. It is not possible to obtain bottles of the same thickness throughout, and therefore when heat is applied to them they dilate unequally, and the ominous click tells that one has cracked and is useless, and possibly the contents already lost. Can this be avoided? Well, so far as I can see, the safest plan is to put the bottles in cold water, and very gradually, say in two or three hours, the bottles being full of water, raising the whole to boiling point. When emptied the quartered fruit must be quickly placed in them while in the hot water, the nearly boiling syrup poured in almost to the top of the neck, and at once tied down very tightly with sound string and parchment or bladder. Or if the wool has been well heated in the oven, a plug of it enclosed in muslintaken out of boiling water may be used as a cork under the parchment.

Since writing the greater portion of this note I was in a friend's house, and the owner being rather noted for his Pears some were brought out of the store room while I was there, most of them showing signs of decay. The housekeeper said to me, "Oh! these are no good; they are never fit to eat." I looked; they were small Beurré Diels, and I found that they had arrived at the same conclusion as myself—that they were only fit for stewing. From the shape of the canned fruit I certainly lean to Mr. Iggulden's opinion that the colonists have discovered this use for them, as well as we have.—Y. B. A. Z.

CYPRIPEDIUMS AT MESSRS. PITCHER & MANDA'S.

CYPRIPEDIUMS are a speciality at Messrs. Pitcher & Manda's nursery near Swanley. They have a large collection admirably grown, and comprising a considerable number of choice varieties. Of the insignes in flower a fortnight ago three of the most noteworthy were Chantini, albo-marginata, and a fine form of the

latter with larger flowers, having a paler lip and a broader margin of white to the dorsal sepal. Of the Spicerianums there were three attractive varieties in pendulum, aureum, and virescens. C. Euryandum majus, C. Ashburtoniae expansum Cooksoni, C. Harrisianum superbum, and others were also in bloom. A fine plant of Cattleya Dowiana aurea is also worth mentioning. It was in flower some time ago, and at the time of my call was bearing a second spike.—W.

CYPRIPEDIUM TITYUS.

THIS charming hybrid was exhibited by Messrs. J. Veitch and Sons, Royal Exotic Nursery, Chelsea, at the meeting of the Royal Horticultural Society, November 15th, when a first-class certificate

FIG. 61.—CYPRIPEDIUM TITYUS.

was awarded for it. As briefly mentioned in our last issue C. Tityus is the result of a cross between C. cænanthum superbum and C. Spicerianum, the latter being the seed parent. No less than four species are, moreover, concerned in the ancestry of this beautiful hybrid, inasmuch as C. cænanthum superbum was obtained from C. insigne Maulei × C. Harrisianum superbum, and the latter from C. barbatum × C. villosum. It will thus be seen that C. Tityus is one of the most interesting crosses of recent years. It is compact in growth and the flower (fig. 61) is of a moderate size and well coloured. The dorsal sepal is large and broad, white, the centre being spotted with chocolate colour, and the base a pale green. The petals are greenish yellow, similarly spotted to the sepal, while the lip is of an olive green shade.

VINE LEAVES AND LATERALS.

CAN any of your correspondents taking part in the interesting discussion on Vine leaves give a reason for the beautiful colouring of the leaves in some places and not in others? Is it something in the soil or their general treatment? Here nearly all our varieties ripen off the most exquisitely coloured leaves imaginable. We send samples of a few varieties. Gros Colman is very beautiful, even the small young leaves, no bigger than the palm of the hand, colour a bright crimson, streaked and blotched with darker and golden shades. We have a span house, 300 feet long, planted with this variety, the canes one year old, and from top to bottom the roof is a blaze of crimson foliage, which has a very beautiful appearance from the inside, the leaves showing up against the bright light. Black Hamburg and Gros Moroc are a bright golden

yellow, not a spot to mar their beauty, and are very effective. Madresfield Court and Barbarossa (Gros Guillaume) are also very pretty, but these two always colour well. Alicante does not colour at all. I remember once seeing in Selkirkshire a Vine of Alicante every leaf of which was as red as blood. This is the only one I have seen coloured. I pressed and dried a leaf and it kept its bright colour for years. Nothing could be more beautiful than these leaves for house and table decoration at this season. Ours are in great demand, finding a ready market for large quantities, averaging from 1s. to 4s. per dozen.

Although I cannot see my way to take part in the discussion now going on in your columns—Extension v. Restriction—still I may mention a few things that have come under my observation which may be of interest. Like most discussions taking place in the *Journal*, a great deal of sound sense is advanced on both sides. Good Grapes, no doubt, can be grown on both principles. A great deal depends on the distance between the Vines. Where the rods are closely planted (say 2 feet) it would be folly to allow much extension of laterals, as it would result in overcrowding. Where the rods are 4 feet apart freer growth of laterals can be practised without any evil effects. The aim should be plenty of good foliage fully exposed to light and air. Whether this can be had on the extension or restriction system depends entirely on the distance between the rods.

Some years ago, when visiting Mr. Murray of Park Hall, Polmont, a Grape grower with as good a record as any in the country, he was then experimenting very largely with Gros Colman on the extension plan. He found that by allowing the laterals to grow unstopped the leaves did not cup so much as is the general case with this variety. I also noticed the same practice carried out on Gros Maroc, strong shoots 6 and 8 feet beyond the bunch, more like young Vines than laterals. At the time of my visit the Grapes at Park Hall were very fine, heavy crops, grand bunches, and fine finish. It would be interesting to know if he still follows this practice and what effect it had on the following year's crop.

Another man who could throw some valuable light on this subject is Mr. Hunter of Lambton, who I believe has tried more experiments with the Vine than any living man. He at one time allowed the laterals full growth. His experiments seem to have been carried out in a very methodical manner. He had the trellis wires painted different colours for guidance in future cropping of the shoots, which he did in alternate years. He also tried the system of allowing the laterals to hang down until all was a mass of foliage from roof to border. It would be of interest to know if the fine Grapes Mr. Hunter has exhibited were grown at the time of these experiments, or if they had anything to do with the extraordinary bunches of Black Hamburgs he has shown. Mr. Witherspoon of Red Rose Vineries, Chester-le-Street, who grows heavy crops of good Grapes for market, pinches very close. His Vines are close-planted. I think he leaves only one leaf beyond the bunch, but allows free growth to ramble on the border close to the sashes.—D. BUCHANAN, *Forth Vineyard*.

[The leaves received from our correspondent were remarkable for their rich coloration, and we are not surprised to hear that such leaves sell freely, since we know a great trade is done in autumn-tinted Carrot-tops.]

SEEING in the *Journal of Horticulture* some account of weight of Vine leaves, I venture to enclose three leaves taken from a rod of Gros Maroc Vine. They weigh nearly 5 ozs., and the largest leaf measures over 16 by 15 inches. I may say that the Vine from which these leaves were taken has carried a heavy crop for the last six years. With regard to stopping laterals, my practice is to stop three, and if room four, leaves beyond the bunch.—J. L.

[The leaf enclosed was remarkably stout in texture.]

WHILE looking at Mr. A. Lloyd's Vines at Hazelbank, Petersfield, recently, our conversation turned to the discussions in the *Journal of Horticulture* respecting the size and weight of leaves. This led us to measure the one enclosed, taken from a Gros Maroc which has been fruiting four years. None of the Vines is heavily cropped, but some of the bunches hanging are in grand condition, Mrs. Pince especially. Madresfield Court had been cut, the heavy October rains having caused them to decay. They were beautifully coloured, and but little cracking had taken place in the berries while ripening.

The house is a span-roof, 60 feet by 31 feet, height 15 feet to ridge, erected for Tulip growing, the owner having a rich collection, which when in bloom form a grand sight. The structure is not heated nor any special borders prepared, but the Vines are planted about 6 feet apart, so as to only partially shade the Tulips. The Vines are hard stopped, and allowed only one leaf on the

lateral growth. The wood on all appears to be well ripened. The sorts that have ripened and finished off good bunches are Gros Maroc, Madresfield Court, Muscat Hamburg, Black Hamburg, Bruxelloise, Muscat of Alexandria, Buckland Sweetwater, Dr. Hogg, and Mrs. Pince. Others are being tried. The point of the leaf got broken by accident; it weighed with the stalk nearly 2 ozs.—GEORGE NOTTAGE, *Gardener to J. Bonham Carter, Esq.*

[The leaf measured 18 inches in diameter, and was very stout in texture.]

ADIANTUM FARLEYENSE.

How seldom do we see a really well grown plant of this beautiful Fern either in nurseries or private gardens. I have been through some of the leading nurseries lately where other exotic Ferns are to be seen in quantity and well grown, but *A. farleyense* presented a miserable appearance. How is it that so few succeed in growing this, in my opinion, the most beautiful of all the *Adiantums*? Is it because growers give it too much water, or dry it off too much in winter? I will not venture an opinion, leaving that to an abler pen than mine. As I have been successful in restoring a sickly specimen to health, however, my treatment may interest some readers of the *Journal*.

When I took charge of these gardens about fifteen months ago the plant in question was growing in a 12-inch pot. The fronds did not cover the surface of the pot, they were so few. On examination I found the soil in a very wet condition, so I did not water it for a month after. Water was applied only when really necessary during the winter. In the spring the soil was rammed firm and a little fibrous peat and sand placed on the surface. Since that time the plant has grown freely, and now measures 3 feet in diameter. During the summer it had a few waterings with weak liquid manure. The plant is grown in a stove temperature with other exotic Ferns, and is never syringed. I damp between the pots with the syringe two or three times a day during the summer in preference to syringing.

I have been trying experiments with three offsets taken from *A. farleyense*; two I potted in fibrous peat and sand, the other one in fibrous loam, rough leaf mould, small river gravel, and sand. The latter plant has grown very freely, and is now in a 6-inch pot. Those potted in peat and sand are still in small pots, and have scarcely made any growth. I enclose fronds for your inspection. Those taken off the plant grown in loam are not by any means the largest on the plant, but are sufficient to show the difference. I should like to hear the experience of those of your readers who are successful in growing this Fern.—C. RUSSELL, *Clayton West, Huddersfield*.

[The frond from the plant grown in the loam is more than thrice the size of the other.]

A MIDLAND PILGRIMAGE.

THERE is a character in one of Hawley Smart's novels, one of whose special peculiarities it was to arrive at the station a few minutes after the particular train he wished to catch had gone. The interesting developments which followed one instance of indulgence in this pleasing diversion are not to be dwelt upon here, but personal experience and observation constrain me to contend that the novelist displayed no mean knowledge of human nature when he made this trait conspicuous in one of his characters. The connection between the incident noted and a visit to the Chilwell nurseries of Messrs. J. R. Pearson & Sons will not be obvious to the reader, but it is distinctly so to the writer, and doubtless made itself felt with peculiar force to a representative of the firm named while patiently waiting at one station for a visitor who had mistaken his train, come a different way, and alighted at another. But there was one feature which the misunderstanding brought out clearly, and it is that whoever alights at Beeston station may rely upon close and accurate directions upon how to get to Pearson's if there be anything in the shape of man, woman, or child to ply with queries. It seems to be familiar to all, and as the distance is small there is no trouble in reaching it afoot, albeit there are certain twists and turns reminding one of those negotiated by the junior Mr. Weller when guiding the illustrious Pickwick to a favourite house of refreshment in London. Being a stranger in a strange land, on a night densely dark, and the possessor of a somewhat cautious disposition, I thought it prudent to test the accuracy of instructions received on alighting by a further consultation at each corner that had to be turned; but this proved to be a needless precaution, and visitors, it would seem, have no excuse for losing their way when going to see the Chrysanthemums and fruit trees at Chilwell.

THE CHRYSANTHEMUM STREAM.

From the time that the Chrysanthemum season opens visitors go to Chilwell in a constant stream. The tide starts flowing at the beginning of November, and continues unceasingly throughout the month. Strong in the possession of magnificent houses and a very large collection of finely grown plants, the firm trouble not about shows, but go in for a

special exhibition of their own. The exhibitors are themselves, the judges are the public, and the prizes are the orders that are disbursed for the good things on view. There is a catalogue instead of a schedule, and the big blooms are on the plants instead of on a board. This leaves no room for complaint about crowded blooms and over-dressing. Good culture helps Nature all it can, and then leaves the verdict in the hands of visitors. If they like a variety they signify their approval in an acceptable way; if they do not, and it cannot be improved upon for another trial, that Chrysanthemum is cast into the outer darkness, and its place knows it no more. I need not go into details about varieties, for some special remarks were made on them a short time ago, but let it be said that Mr. C. ("Chrysanthemum") Pearson as buyer, and Mr. Pithers as grower, have done their work with judgment and skill. There are few high-class novelties which are not represented in a condition that does abundant justice to the treatment they receive. Viewing the collection broadly it is not surprising to hear that visitors go to inspect it from nearly all parts of the country, and considering it individually it is just as little cause for wonder that not a few of them draw upon it for their own future supplies.

GENERAL PLANTS.

Some of the structures at Chilwell must be amongst the finest in the country. They were erected by the late Mr. J. R. Pearson, and were a source of considerable pride to him. His sons and successors do that which doubtless would have pleased him most—keep them in good condition and excellently furnished. For Zonal Pelargoniums the midland firm enjoy a world-wide reputation, the growth of years. Their strains are marked by vigour of growth, fine trusses, and beautifully rounded substantial pips. There is much food for enjoyment in the collection to all lovers of these plants for pot culture, and grateful recognition should be made of the excellent work that has been done with them. A passing reference by no means does them justice, but there are other things to note, and space fills all too rapidly. Asparagus plumosus grows as one rarely sees it. It is planted out in a border originally prepared for Lapagerias, the soil being good and very porous. The plants flourish like weeds, growing in dense masses 3 or 4 feet thick from the face of the wall. There appears to be enough for supplying the whole county. Another plant in splendid condition is *Tabernaemontana coronaria flore-pleno*. It, too, is planted out, and enjoys a steady heat. Its growth is wonderfully luxuriant, and it flowers nearly all the year round. It is a most useful plant, for the blooms are invaluable for cutting. *Maréchal Niel* Rose is rarely done so well as it is there. The stock of plants prepared for sale is enormous, and they are conspicuous for sturdy growth and perfect ripening. Clematises are another great feature, and *Adiantums*, which fill one of the huge houses above referred to, are splendidly managed. There is a little surprise in store in the collection of Orchids. Ah! you did not know that Pearsons' did these. Just so. But they do. The collection is not the largest in the world, but it is choice and well managed. I was particularly struck with the *Cœlogynes*. These are Mr. "Chrysanthemum's," too. He might not admit that he is rather proud of them, but he looks at them so fondly that you know he is. They are splendidly grown, and in perfect health. Note the luxuriant leafage and fat bulbs. They are as significant as the plump rosy cheeks of a schoolboy before he has made himself ill by unheard of exploits in Apple-eating.

FRUIT AT CHILWELL.

Speaking of Apples brings Mr. A. ("Apple") Pearson to mind. He is brimful of energy, and not to be kept waiting with impunity. His is the fruit department, and to the fruit nursery he conveys me when at length I fall into his hands. Chilwell tells the same significant story as the southern localities with respect to fruit. The demand keeps on growing, and more land is being broken up for planting. It is well done without any question; two crops of roots are taken and then Clover is sown. A good dressing of stable manure and night soil is spread on, and this with the Clover dug in. The land is dug over and the subsoil broken up a spade deep. It is not brought to the surface, but is thoroughly loosened and left. This is all done by hand labour. The work is doubtless hard, and the process somewhat expensive, but it is sound and will give its reward. A comment to Mr. Pearson on its healthy, even though laborious character, elicits the information that in his younger days strength was imparted to a delicate constitution by a few months' hard digging with the men. Mr. J. R. Pearson was a far-seeing man, and did not spare his sons when he saw his way to ultimately benefiting them. When the soil is first thrown up it looks suspiciously tenacious, but in a very short time it softens and crumbles, then planting is at once taken in hand. That is the way to manage the land for fruit. Skimming the surface with a plough may be very well for corn, but it is not enough for trees that have to remain years on the land.

NEWTON WONDER APPLE.

If Mr. C. Pearson looks lovingly on the *Cœlogynes*, what shall I say of Mr. A.'s attitude towards the firm's great Apple Newton Wonder? His catalogue of its virtues is inexhaustible. All his eloquence (and there is a good flow of it) fails to do it full justice. There is abundant reason for a little enthusiasm. The Wonder is a fine Apple—a very fine Apple. Wherever one goes—north, south, east, and west—its good qualities are sung, and other fruit nurserymen speak highly of it besides Mr. "Apple" Pearson, so it is not a personal matter. The variety is a splendid keeper, of fine cooking quality, a heavy bearer, and does well both on the Paradise and Crab stocks. It is a late Apple

that is bound to force its way into favour both for market and home use. It has a general resemblance to Wellington, and possesses the very open eye of that variety. There is a fine stock of it at Chilwell, from maidens to five or six-year-old trees, and plenty of trained material in different stages, so that all requirements are provided for. Throughout the nursery it is conspicuous for its sturdy growth and broad substantial foliage.

TRAINED AND STANDARD TREES.

There is a very fine stock of trained trees. There must be several acres of them altogether, and all are excellently managed. To begin with, all have been transplanted once or twice, and hence the roots are of the right character, so that instead of coarse sappy shoots sturdy matured growth is observable. A great deal of care has been devoted to the training, and the trees are all excellent examples of good workmanship. Mr. Pearson has a little way of pulling out his knife and severing ties where the work has not been done to his entire satisfaction, then leaving a streamer of matting on the tree for indicating that it has to be done over again. The workmen do not relish this by any means, and in course of time learn to avoid its occurrence by careful work. Newton Wonder, New Northern Greening, Lane's Prince Albert, Bismarck, and Potts' Seedling, are all largely represented. It is worth noting that the Wonder has a tendency to bearing at the tips, and should not be shortened except where extension is wanted. Is it generally known that Potts' Seedling is a particularly good town Apple? If not it ought to be. There are few varieties which do so well in smoky localities. Plums are grown largely as horizontals, and look remarkably well. Pears also comprise a large and representative collection. *Maréchal de Cour* is one of the hardiest and most vigorous of them all, while *Doyenné Boussoch* proves its value as a market variety. It is twice the size of Hessele, and a better cropper. A tree was pointed out that has borne well for eleven years. This is worth remembering when the dearth of really good market Pears is considered. The standards are splendid trees. There are about 60,000 of them, all staked. What an amount of labour it must entail. But Mr. "Apple" believes in doing everything well. His ideas are sound, that you soon find out in talking to him, and the evidence of your eyes will tell you the excellence of his methods. There is a grand collection of Apples and also of Damsons. To complete a morning among them that has begun with Chrysanthemums at daybreak is a task the fulfilment of which is at once a benefit and a pleasure.—W. P. W.

EVENTS OF THE WEEK.—Now that the majority of the Chrysanthemum Shows are past horticultural matters are comparatively quiet in the metropolis. The annual dinner of the National Chrysanthemum Society will take place at Anderton's Hotel, Fleet Street, on Wednesday, November 30th, when Sir Edwin Saunders will preside. The customary auction sales will also be held, for particulars of which see advertisements.

— THE WEATHER IN LONDON. — During the past week the weather in the metropolis has been comparatively mild for the time of year. Saturday was bright, though rain fell heavily during the night. Sunday opened fine, however, similar weather continuing on Monday, but with fogs in the morning. Tuesday proved dull and foggy. At the time of going to press it is cloudy, but fine and colder.

— THE WEATHER IN KIRKCUDBRIGHTSHIRE. — Contrary to expectation the weather during the past week has slightly improved. Heavy rain fell on the night of the 14th, but the 15th, 16th, 17th and 18th, although dull, were dry. Fog, however, prevailed in the evenings. The night of the 18th was clear and a little frosty, but heavy rain fell all day on the 19th. The 20th was dry but dull, and to-day (21st) is also dry with faint gleams of sun.—S. ARNOTT.

— THE GARDENERS' ROYAL BENEVOLENT INSTITUTION.—The friends of this Institution with ourselves, will be very pleased to hear that the financial result of the Anniversary Festival Dinner, held at the Hotel Métropole on November 15th, and reported in our last issue, from all sources amounted to nearly £2200.

— CHISWICK GARDENS. — The Chrysanthemums in the great vinery are still very interesting, filled as the building is from end to end with plants grown much more naturally than is usually the case. Disbudding has, it is true, been practised to a certain extent, but many of the plants are regular bushes, carrying from twenty to thirty blossoms, instead of the regulation two or three at the most.—W. WILKS, Secretary.

— APPLES IN BELGIUM.—According to the *Illustration Horticole* special trains laden with Apples, mostly destined for the English market, have been dispatched from Tongres and St. Trond.

— IMPORTATION OF APPLES.—The United States and Canada have, says a reliable salesman of Covent Garden Market, already despatched 400,000 barrels of Apples to Liverpool and London this season.

— GARDENING APPOINTMENT.—After eleven and a half years' service with Mrs. Jerome, Holland House, Sutton Coldfield, as head gardener, Mr. J. E. Pears has left to be gardener to J. D. Ripplingille, Esq., Elsinore, Manor Hill, Sutton Coldfield.

— A CALIFORNIAN FIG ORCHARD.—California claims to possess the largest Fig orchard in the world. It is said to occupy 460 acres of land, and the crops derived from the trees are simply enormous. An American contemporary states that 2160 lbs. of Figs were obtained from twelve trees in one season.

— FLOWERS FROM THE SCILLY ISLANDS.—It is stated that "The latest information from the Scilly Islands is that the flower traffic has already commenced in earnest, and that extensive consignments of Marguerites and Chrysanthemums are being despatched. The numerous crops of Narcissi are looking remarkably healthy, and there is but little doubt there will be blooms in the market by, if not before, Christmas."

— BANANAS IN ENGLAND.—According to the opinion of Mr. White of Covent Garden, Bananas are gradually becoming a popular fruit in this country. Still, the English in this respect are far behind the Americans, whose partiality for the Banana is such that in August alone they imported more than one million and a quarter bunches. We get our Bananas from the Canary Islands and Madeira, but it is said that very soon we shall have them from Sicra Leone.

— GOOD VEGETABLES.—We have received from Mr. S. Windsor, The Gardens, Coed Helen, Carnarvon, some excellent samples of vegetables. The Leek sent was particularly fine, the total height of the plant being 4 feet, girth of blanched portion 7 inches, and the length of same 8 inches. Brussels Sprouts were also good, the stalk of "Aigburth" being one of the finest we have seen; "Bullet" was not so big, but well covered with fine firm sprouts. The Beet, Dickson's Reliance, was of excellent shape and colour. An Apple sent is probably a local seedling.

— CALIFORNIAN PEARS.—240 tons of fruit have been sent to England this season from California, says an American contemporary. Of this large amount two-thirds were Pears. The fruit colours finely during the long voyage, and is in best condition for selling when it arrives. No other fruit excepting the Apple and the Orange bears such long transportation so well as the Pear. The flavour of Californian fruit has improved of late years, the growers having learned that too much water for the trees while the fruit is growing increases its size, but impairs its quality.

— FLORIDA ORANGES.—With reference to the paragraph on Florida Oranges in the *Journal* last week, a gentleman of Mandarin, Florida, writes: "We have been sending our Oranges to England for some years past; but they have been sent in the ordinary Atlantic liners—swift, but not fitted for carrying quantities of fruit. The shipment referred to by you is a new scheme. A special fruit steamer has been chartered by a capitalist interested in Florida, and, as you mentioned, sails direct from Fernandina, Florida, to England, thus saving the disastrous reshipment in New York. Last year we did not receive remunerative returns from the Oranges sent to England, chiefly owing to high freights and rotting of the fruit in transit. The new direct shipment is intended to avoid both."

— THE WOLVERHAMPTON HORTICULTURAL SOCIETY.—A report of the Exhibition in July last appeared in our columns, and we then stated that with the fine weather success was assured. This was so, for a profit of £310 on the Exhibition was added to the Society's funds. It has now been decided to appropriate £74 for the purpose of assisting in providing a band during the summer in the Public Park, and £1000 has been voted for the purpose of building a large conservatory in the Park, and this is in addition to benefits already received by the Park Committee from the surplus funds of the Floral Fête. A sum of £200 remains to the credit of the Horticultural Society, in addition to their reserve fund, so that for a Society only in existence four years, a great success has been achieved. A three-days Exhibition has been decided upon for July, 1893.

— THE LOQUAT IN INDIA.—The *Calcutta Englishman* says:—"The N.-W. P. Government is obtaining a consignment of grafts and seeds of the Maltese Loquat for experimental cultivation in India. The cultivation will be tried at the Saharanpur and Lucknow Government gardens."

— NON-SYRINGING AND MEALY BUG.—Two sentences in my letter on page 434 last week are a little ambiguous. They should read, "I do not think one could imagine a house more unlikely to be cleaned; and the Vines were not scraped except about the spurs." The two "not's" were omitted from those sentences.—R. R., *Belfast*.

— HORTICULTURAL CONGRESS AT CHICAGO.—An horticultural Congress will, it is stated, be held at Chicago on August 16th and three days following, next year. The Society of American Florists, the American Seed Trade Association, and the American Pomological Society will hold their meetings in the same city during that month.

— GARDENERS' ORPHAN FUND.—A successful concert was given in the Vestry Hall, Chiswick, recently, in aid of the Gardeners' Orphan Fund. An excellent programme was provided, and the hall was filled with local horticulturists, gardeners, and others desirous of supporting this charitable Institution. A sum of over £20 has been realised through this concert for the fund.

— TULIPS AT THE WORLD'S FAIR.—The Tulip bed in front of the horticultural building at the World's Fair, Chicago, will cover a large space, being cut out in the turf, and will make a gorgeous show of colour in the early spring. The leading colours will be used in masses, always preferable to a mixed border. The bulb borders will be the attraction shortly before the great Pansy display.

— DISEASES OF PLANTS AND FRUIT TREES.—Under the auspices of the Technical Education Committee of the Kent County Council, Mr. W. B. Bottomley, has been giving, and is now continuing, a course of weekly lectures on "Diseases of Plants and Fruit Trees," at Speldhurst. Mr. Bottomley not only endeavours to enlighten his listeners as to facts upon which they are, if not entirely ignorant, at least somewhat dubious, but by encouraging them to ask questions and relate their own experiences, he seeks to give them information.

— THE NATIONAL FLOWER OF AMERICA.—The Americans are yet undecided as to what shall be their national flower. "Half a century ago," says "Meehan's Monthly," "intelligent people were anxious that there should be some national flower, and *Kalmia latifolia* was generally named in that connection. The Golden Rod has been suggested, but there are many plants known by that designation in America, and it appears that no one can determine as to which species should be chosen."

— EXAMINATIONS IN HORTICULTURE.—In connection with the proposed examination by the Royal Horticultural Society of gardeners and students who may wish to sit for examination in different centres, we are desired to say that application for particulars from all persons who are not Fellows of the Society must be accompanied by stamped and directed envelopes if replies are expected. Neither societies nor individuals from whom information is sought by strangers ought to be subjected to a tax in conveying it, or to the charge of a want of courtesy if replies are not sent. Particulars of the scheme in question can be obtained on the terms suggested from the Secretary, Royal Horticultural Society, 117, Victoria Street, Westminster, S.W.

— LARGE TREES.—The opening meeting of the winter session of the Edinburgh Botanical Society was held on November 10th. The President (Dr. Christison) in his address, gave a *résumé* of observations on the size and rate of growth of trees taken by his late father, Sir R. Christison. In mentioning some of the principal British Oaks, he said he believed the Newland Oak in the Forest of Dean, Gloucestershire, was entitled to the honour of being called the King of British Oaks. The Oak in Scotland rarely reached the size and vigorous look so commonly met with in English specimens. The largest was in Lanarkshire, which was 23 feet in girth at the narrowest part. The Beech at Newbattle Abbey was perhaps the grandest tree in Great Britain. Its girth at the ground was 43 feet, and 18 feet 2 inches at 8½ feet from the ground, and the circumference of its foliage 400 feet. It was still quite healthy and gave off dense foliage. Notwithstanding the great diffusion of the Beech over the country, none remained which had attained the giant size of 20 feet in girth at 5 feet from the ground. There were no gigantic Scotch Firs remaining now, the largest he had been able to hear of being about 13 to 14 feet in girth. There was no Ash, either, in Scotland that girthed 20 feet at 5 feet up the stem.

— AGAPANTHUS UMBELLATUS ALBUS.—Am I right in supposing there are two distinct plants under this name? "Rectory," page 416, says he cannot get it to flower, and I must confess that I am equally unsuccessful, although I have grown two plants of it for several years. These were obtained from a highly respectable nurseryman. But on page 438 Mr. Edward Costate says he flowers it well by treating it the same as the blue variety. The plants I have would not answer to this treatment, as they naturally die off every autumn, while the blue variety retains the greater part of its foliage and flowers abundantly every year.—W. H. DIVERS, *Ketton Hall Gardens, Stamford.*

— PROPOSED WINTER GARDEN FOR DUNDEE.—At the recent Dundee Chrysanthemum Show ex-Lord Dean of Guild M'Grady expressed the hope that before long they might have a winter garden established in one of their public parks. People in Dundee, he said, were very well off now in the matter of public parks, and in the summer time no more health-giving resort could be had than these parks. While the community could either visit these or take a ramble into the country during the summer time, they found that in the winter season they were very much confined. He thought therefore nothing could be more attractive than the establishment of a winter garden in Dundee.

— STAPELIA GIGANTEA.—According to the "Kew Bulletin" this Stapelia is now represented at Kew by a specimen bearing six flowers and buds. It is a native of Zululand, where it was discovered by Mr. Plant thirty years ago and sent to Natal, from whence it was sent to England by Mr. Cooper, at that time collector for the late Mr. Wilson Saunders. Although in cultivation so long, there is no record of the plant flowering until October, 1888, when a specimen in the rich collection formed by the late Sir George Macleay at Pendell Court flowered, and was figured in the "Botanical Magazine," t. 7068. The flowers vary in size from 8 inches to 14 inches in diameter; they are coloured pale yellow mottled with red-brown, and are covered with fine whitish hairs.

— WOOLTON GARDENERS' MUTUAL IMPROVEMENT SOCIETY.—At the last meeting of this Society a very good idea was tested. A "question box" is provided, in which anyone can place a written question. The questions are taken out and answered if possible by the members present. The plan answered very well. Mr. J. Glover, gardener to Sir A. B. Walker, Bart., Gateacre Grange, then read a sound practical paper on the "Cultivation of the Bouvardia," and the following varieties—of which he had specimens on the table—were recommended:—President Garfield, double red; President Cleveland, Alfred Neuner, Hogarth, Priory Beauty, Vreelandi, Jasminoides, and Humboldti. The double varieties he more especially recommended owing to their lasting properties.—R. P. R.

— THE OPENING OF KEW GARDENS.—The desirability of the earlier opening of the Royal Gardens, Kew, was discussed at the meeting of the Richmond Town Council on Wednesday, November 16th, and, as the result, the following resolution was unanimously passed:—"That a deputation, consisting of six members of this Council, be appointed to wait upon the First Commissioner of Works on a day hereafter to be arranged to make a humble request that the Royal Botanic Gardens at Kew be opened daily for the admission of the public at 9 o'clock A.M. This Council is of opinion that the Government by granting this concession would be acting in the interest of botanical science, saving visitors from distant parts of the kingdom much disappointment and loss of time, while it would confer a much-coveted boon upon those living in the neighbourhood and in the metropolis."

— ENGLISH FRUIT IN INDIA.—The cultivation of English fruit in the neighbourhood of Simla is about to be tried on a very extensive scale. During the next seven years, says an Indian magazine, the Punjab Government is prepared to carry out a scheme for its careful cultivation, the annual cost being estimated at 2000 rupees. Large gardens are also being planted near Naini Tal, Almorah, Raniket, and many parts of the Himalayas. Kashmir has always been celebrated for its delicious fruits, its Apples, Pears, Grapes, Apricots, and Walnuts. On the Nilgiris also most of these fruits flourish. At Ootacamund, Coonoor, and Kotagiri, may be found examples of carefully kept gardens where, in that perfect climate surrounded by lovely masses of English flowers, English fruits flourish luxuriantly. Even the wild fruits of England, such as Blackberries and Raspberries, grow in quantities on the hillsides and among the bracken; and wild Strawberries are also to be found there.

— NOVA SCOTIAN APPLES.—At the opening of the Dundee Chrysanthemum Show recently Mr. Low, in referring to a collection of Canadian and Nova Scotian Apples, said: "Unfortunately we in this country could not produce anything equal to these either in quality or in variety, but we were closely connected with the colonies, and it was very pleasing to know that those on the other side of the ocean are able to place in the market such splendid fruit." The above remarks may apply to Scotland, but they certainly do not to the British Isles generally. At Earl's Court and elsewhere this year I have seen some magnificent collections of splendidly coloured Apples that could hold their own with any produced in the colonies. What say other Britishers?—C.

— BLUE TITMICE AND FRUIT BUDS.—I notice our old friend, "A Lanarkshire Bee-keeper," falls foul of these little busybodies as "scourgers of Currant and Gooseberry bushes and devourers of bees." As this is quite contrary to my observations in both respects, I most respectfully ask for the observations of other readers. I have watched them as a practical observer, in both respects, for forty years, but can safely say I never found them injure either. I have seen them tear open buds on Pear trees, and have driven them hastily away and climbed 20 feet or more to examine the identical bud, and found it contained a "worm i' the bud" which "Tommy" was bent on fetching out. They are the best scale destroyers we have, either on fruit, Ash, or Sallow. They are also among our best friends for destroying caterpillars and aphides. The only birds which take my fruit buds are house sparrows and bullfinches. I have caught twenty-four of the latter in trap cages in my garden lately.—J. HAM, *Astwood Bank.*

— LIVERPOOL HORTICULTURAL ASSOCIATION.—Last Saturday evening the first meeting of the session was held in the Committee Room, Wm. Brown Street. W. Fletcher Rogers, Esq., the Hon. Treasurer, presided, and there was a good attendance. Mr. Thomas White, the Chairman of the Association, read a paper on "Bulbous Plants," dealing with the Hyacinth, Tulip, Crocus, Narcissus, Scillas, Ixias, and others, tracing their history and varieties. Messrs. Sargent, Ranger, and Ker took part in the discussion, the latter dealing especially with the early cultivation of the Tulip. Mr. Harrison, Knowsley Hall, followed, and gave some interesting details of bulbs grown outdoors at Knowsley, mentioning *Vallota purpurea*, *Lilium giganteum*, and others. A suggestion was made by Mr. Ker that more of the Liverpool gentlemen should be induced to attend the winter meetings, and it was hailed with evident satisfaction by all present. A vote of thanks to the lecturer and the Chairman brought the meeting to a close.—R. P. R.

— CYCLAMENS AT READING.—While at Reading Show last week I seized the opportunity of visiting Messrs Sutton & Sons' nurseries to see the Cyclamens of which I had heard so much praise. I was astonished and delighted by what I saw. The sturdy plants were carrying a profusion of beautiful flowers. Several houses are devoted to them, though the plants are not yet all in bloom, they being in various stages of development. Amongst the most noticeable in flower was a new variety named *C. persicum* Salmon Queen. This is one of the most charming in the whole family. The colour is a delicate salmon shade, and when sent out this variety will doubtless quickly become popular. Vulcan was another exceedingly striking variety in bloom. The flowers of this are dark crimson, and perfect in shape. Butterfly is a charming white, and with Vulcan and Salmon Queen form a most beautiful trio. In the structure devoted to the giganteum section Giant White was decidedly the most prominent. It is a grand strain, the flowers being of the purest white, and absolutely faultless in shape, standing well above the foliage. The Giant Crimson and White is also very striking, the upper part of the flowers being pure white and the base bright crimson, forming a most pretty combination. Giant Rose was also in splendid condition. These plants, Mr. Martin, Messrs. Sutton & Sons' skilful grower, told me had been taken to Cheltenham and Gloucester, the results of which were recorded in the *Journal* last week, and yet the foliage and flowers were remarkably fresh. I would advise any of your readers who happen to be in or near Reading, to call and see these Cyclamens.—H. J. W.

THE MUSTARD BEETLE.

MR. F. ENOCH has contributed some interesting and valuable notes on this insect to a recent number of the "Entomologist." He believes that at present this pretty but destructive beetle is steadily on the increase in the Mustard-growing districts, where not unfrequently it ruins the entire crop. This species, *Phaedon cochleariae*, or *betulae* less correctly, was first found doing serious mischief near Ely in 1854, though there is a passing notice of it in Curtis's "Farm Insects" of 1841. During June Mr. Enoch, from "information received," was led

to visit the Mustard fields in Cambridgeshire and Suffolk, where he soon made acquaintance with vast armies of the foe busily attacking both brown and white Mustard. He was impressed with the fact that not only does the larvæ or grub of the species devour the Mustard just as the beetle itself does, both were at work together; the plants were blue with the elytra of thousands of beetles, and besides them were hosts of young larvæ, rapidly reducing the leaves to skeletons! Having an ordinary bag-net with him, Mr. Enoch began to beat the drills for about fifteen minutes, boxing the captives he had made that he might count them afterwards. On examination he found that in this short time he had beaten out upwards of fifteen thousand! The eggs were not difficult to detect, being on the under side of the leaf, but the parent ingeniously scrapes a slight hollow in the cuticle, and by this means each egg is protected from harm should the plants be blown about. On a single leaf he counted as many as 700 odd eggs, and a plant he examined had no less than 9234! In company with these beetles were also many caterpillars of the diamond-back moth (*Plutella cruciferarum*), making it all the worse for the unfortunate plants. Mr. Enoch is not prepared to suggest any special remedy for this insect, but he believes the number of beetles might be greatly reduced by use of a sweeping net at the right time, as they fall into it readily, being most sluggish.—**ENTOMOLOGIST.**

ROYAL HORTICULTURAL SOCIETY.

NOVEMBER 15TH.

SCIENTIFIC COMMITTEE.—Present: Mr. McLachlan (in the chair), Mr. Morris, Dr. Miller, Dr. Russell, Rev. W. Wilks, Prof. Green, Prof. Oliver, Dr. Bonavia, Mr. Wilson, Prof. Church, Rev. G. Henslow, Hon. Sec.

Injury to Plants by Fog.—In accordance with the proposal of the Scientific Committee made at the last meeting, the Council of the Royal Horticultural Society have passed the following resolutions in reference to the investigation of the nature and injuries to plants by fogs.

1, That the Royal Horticultural Society, through its Scientific Committee, having devoted considerable attention to the effects of London fogs on cultivated plants, is of opinion that the increasing prevalence of these fogs is causing great inconvenience and loss to horticultural interests within the metropolitan area; and as these interests are associated with one of the largest and most important enterprises of plant cultivation under glass carried on in any part of the world, it is a matter of the greatest importance that the circumstances connected with the chemical compositions of these fogs, their origin and extent, the amount of sulphurous acid contained in them, as well as the diminution of light caused by them, should be carefully and exhaustively investigated.

2, This Society, being also of opinion that London fogs are detrimental to public health, and are calculated to render London an undesirable place of residence for many months of the year, as they interfere with trade and public business, and cause serious loss to the community generally, invites the co-operation and support of kindred societies and all organisations interested in the subject, in a representation to the London County Council to institute an inquiry into the causes and circumstances of these fogs, with the view of reducing their injurious character, or if possible removing altogether the causes which have led up to them.

On the suggestion of the Scientific Committee the Council agreed to set apart one of the propagating pits at the Chiswick Gardens, for the purpose of carrying out experiments during the current winter to mitigate the effects of fogs on cultivated plants. It was also agreed to inform the Chiswick Board of this arrangement, and to request the Superintendent to give what assistance he could in carrying out the suggestions of the officers placed in charge of the experiments.

Dr. Russell stated that he thought it would be of great importance with regard to the fog question if a comparative and simultaneous series of determinations of the amount of light could be carried out at once, both in the City and outside London, in order to thus obtain a more exact idea of the enormous loss of light experienced in the City during the winter months. With the object of familiarising himself with the method adopted by the Manchester Committee, he was experimenting with their process.

Garden Labels.—Mr. Morris remarked on the difficulty of finding any material suitable for labels. They had tried a great variety at Kew, but the best in being most durable was a strip of lead with the name stamped upon it. He exhibited a sample from the garden of A. Cushney, Esq., Pains Hill Park, Cobham, dated 1774, on which the name "White Magdalen Peach" appeared to be as sharply indented as at first. It is said, however, that the lead of the present day, in consequence of its being purer through desilverisation, would probably not last so long.

Lilium auratum.—Mr. Wilson mentioned that a single bulb of this plant in his garden had thrown up eight flowering stems. When dug up it was found to have developed seven good well-formed and large bulbs. It grew in a good vegetable and loamy soil.

***Wellingtonia* Infested with Fungi.**—Specimens of fallen leaves and shoots of this tree were sent from the gardens, Orton Hall, Peterborough, with numerous small white agarics growing upon them. It proved to be *Mycena hyemalis*, *Osbeck*.

Alder Leaf Perforated.—Mr. Wilks showed a dead leaf of Alder very symmetrically perforated with two series of holes. It was most probably due to a sudden chill on the expansion of the buds in spring. A similar occurrence is not infrequent in Horse Chestnut and other leaves from such a cause.

SOME OF THE NEWER ROSES.

I HAVE been very pleased with the notes on Roses by W. R. Raillem, which he has given in the *Journal of Horticulture* at different times. His description of varieties are so good that anyone wanting Roses should have no difficulty in selecting good reliable sorts from his list.

In his recent notes on newer Roses (page 394) he did not mention Madame Hoste. This and Ernest Metz I consider among the best that have been sent out lately. Madame Hoste is a fine exhibition Rose, and is equally good for all other purposes, giving an abundance of first-class blooms. We had Ethel Brownlow three years before it produced a bloom fit to cut, but this year it has done well, giving several first-class flowers; but it has never grown strongly with us. It is an excellent exhibition Rose when it comes good, but it is not free enough to recommend for general purposes. Souvenir de S. A. Prince is one of the newer Roses. It is a good grower, free bloomer, with an agreeable fragrance, pure white, and opens well in all weathers.—J. L. B.

EARLY MARÉCHAL NIEL ROSES.

ON the resplendent beauty of this Rose there is little need to dwell, as for years past it has been an object respecting which rosarians of widely diverging opinions have united in expressing unqualified admiration. Unrivalled for brilliancy of colour, faultless in shape and form, combined with fragrance that leaves nothing to be desired, it is unsurpassed by any other Rose of its class. Its robust constitution, too, is quite in keeping with its other good features. Its growth is strong and vigorous, its flowering qualities are of the freest, and its general stamina is excellent. For these reasons its position among the limited number of Roses suitable for flowering at Christmas may be considered impregnable. Nothing will serve to show the popularity of this variety in a better light than a glance down the list of market prices towards the end of the year. The superior price which the flower-loving public is willing to pay for Maréchal Niel Roses is a tribute to its value that speaks more eloquently than words.

Whatever may be the failings of this Rose when cultivated in the open air (and in this respect I am aware it is not without detractors) there is nothing uncertain in its habits when treated generously under glass. It is there, no doubt, that we see it at its best. Certainly it only gives one crop of flowers each season, but it must be admitted that it produces an immense quantity, and by judicious management it is possible to prolong its period of blooming for a considerable time.

For early flowering there can be no question as to the decided advantage which plants in pots possess over those planted out. When in borders they are liable to various complications from which the potted plants are entirely free. These are so obvious that they can be seen at a glance. The plants are under entire control, thus enabling the cultivator to keep them in any required state of moisture, and the roots are prevented from penetrating into unsuitable soil when in pots. This is a great check to canker as a rule. Moreover, Roses in borders are more or less fixtures in the house, while plants in pots can be removed to different atmospheres and temperatures as the occasion may require. As a means of securing well-ripened wood, what is equal to a removal outdoors after growth is completed? This becomes an easy matter when the Maréchal Niel is cultivated in pots.

Unless the growths are thoroughly matured and ripened the best directed efforts can only end in disappointment. The eyes, instead of producing plump buds, reward us for our pains with nothing but blind growths. Large plants in borders sometimes act in this manner, but there is no reason whatever why plants in pots should suffer from this cause. As the new growths begin to push the old leaves remaining gradually turn yellow and fall off.

SEASONABLE NOTES.

At this time of year, perhaps the greatest hindrance to success is want of light. The long nights and short gloomy periods of daylight are evils incidental to the season, and therefore unavoidable. The mists and fogs that abound all tend to intensify troubles of this nature and to make matters worse. But much may be accomplished to minimise the damage done. In this district (Enfield) we are badly afflicted with fogs, which arise from the marshes that bound us on the east. This has induced some good growers to defer their efforts in Rose culture to a later and brighter season of the year. Fogs bring in their train a host of evils, among which I may mention mildew, utter cessation of growth, crippling of the foliage, and decay and deformity in the flowering buds. The treatment just now should all point towards counteracting these after effects. The nasty deposit left on the glass, and which places the occupants of the structure in a sort of twilight, must be washed off as often as it appears.

Vexatious as this process undeniably is made by frequent repetition, nothing less will serve to keep matters straight inside just now. A little top ventilation when the opportunity occurs should be given to admit fresh air and to allow the stagnant atmosphere to escape. Root-watering

and damping will need to be performed cautiously, but the hot pipes can be steamed and the atmosphere kept in a moist condition under the most unfavourable circumstances. In foggy weather an even temperature should be maintained and excessive heat avoided as likely to do more harm than good, and if the plants are kept as close to the glass as they can be placed with safety the chances are all the more in their favour.—**ENFIELDIAN.**

NEW VIOLAS.

Now the Viola has become an established favourite for decorative work, a few words as to the new varieties now being introduced may be welcome to many. Before alluding further to them, however, I may just throw out a hint as to what delightful pot plants they are early in the spring for greenhouse decoration. It is only necessary to put a few plants into 5 or 6-inch pots according to the strength of each plant, keep them in a cold frame during the winter; or pot them in February or March and grow them in a cold frame until they begin to show their buds, then remove to the greenhouse. The Viola is essentially a welcome spring flower, for it is so early in blooming, so varied in colours, excellent for cutting for glasses, and so many varieties are deliciously fragrant.

The immense popularity of the Viola is strong evidence of its value as an outdoor decorative plant, and new varieties are plentiful, so many now devoting themselves to the raising of seedlings. Messrs. Dobbie and Co. have persistently for a few years brought the Viola into notice, and some good sorts have emanated from Rothesay, and this autumn they sent out five new varieties of considerable promise. One is named Peter Barr, after a well known honoured horticulturist, and has received three certificates. Lemon Queen, Edina, Rob Roy, and White Duchess also are introduced by Messrs. Dobbie. Other new varieties are expected from the Kyles of Bute, as I understand that some of the Belfast seedlings are to be sent out from there.

I sent you notes not long since of Dr. Stuart's and Mr. George Steel's new varieties of miniature Violas and others, also of some very fine seedlings from Belfast, and I have recently received from Mr. Stuart of Belfast blooms of Mary Stuart, which closely resembles Bridesmaid, but is a little lighter in colour, and a first-class variety. Another named Mave Roe (in the Irish language "White Maid") is a French white, slightly flushed with lavender, and of fine form. Other promising seedlings also accompanied them.

We certainly are on the right track for many lovely acquisitions in spring; but some are procurable now.—**W. DEAN, Sparkhill, Birmingham.**

THE NATIONAL CHRYSANTHEMUM SOCIETY.

THE remarks which have been circulating lately in reference to our head Chrysanthemum Society lead me to suggest that it behoves the executive to be on the alert to avoid that loss of public confidence which is the breath of life to any society, and which once lost can hardly by any exertions be restored. In matters horticultural it is a decided advantage to have a central authority whose decisions are as unimpeachable as is possible with poor humanity, and which at any rate shall be absolutely above the suspicion of being influenced by favouritism or self interest; this being so I hope every lover of the Chrysanthemum will abstain from any course likely to bring discredit upon the Society, and endeavour to strengthen the hands of the management in every way possible. With this object I may suggest that the position of the Society would be immensely improved in the eyes of the country at large if steps were taken to widen the basis of the Committee by an infusion of fresh country blood, and do away with such sarcasms as "London clique," &c., which are at present much too frequent. Country members could not of course attend meetings with the regularity possible to those living near town, but travelling becomes more easy and general every year, and genuine enthusiasts, who are to be found in every large town in the country, would, if elected, be seen at the table often enough to be a help and strength to the Society, and be the means of keeping it in touch with the principal provincial centres.

While on the subject of reforms I would, in common with many others, like to know if every possible effort has been made to secure a better place of meeting than the dismal one in which the Shows are now held. I would especially draw attention to the injustice that may be done to novelties by adjudicating upon them in a place where the light is so bad that the best eyesight cannot tell a white Chrysanthemum from a yellow one, thus practically restricting judgment to two of the three qualities which go to make a perfect bloom—viz., size and form—leaving colour, which is of equal importance, almost entirely out of the question. I hope these matters may be taken up in a practical spirit to the lasting benefit of the Society.—**CHAS. E. PEARSON, Chilwell.**

KINGSTON AND SURBITON.

THE Committee of the Kingston and Surbiton Chrysanthemum Society have decided that their next Exhibition will be held on November 7th and 8th, 1893, and Judges are chosen to officiate on the occasion.

DERBY CHRYSANTHEMUM SHOW.

WE are informed that the prizewinners of £10 to £8 and £6 in the class for forty-eight blooms were won by Messrs. W. & G. Drover, Fareham; Mr. Evans, gardener to Sir Henry Wilmot; and Mr. Goodacre, Elvaston, respectively, in very close and excellent competition. The Show was held on the 11th and 12th inst.

A NEW CHRYSANTHEMUM SOCIETY IN BELGIUM.

A SOCIETY has just been founded in Brussels under the title of the Société des Chrysanthémophiles. The work undertaken by it, the promotion of knowledge concerning the culture, propagation, hybridisation, diseases, and insect foes of Chrysanthemums. The President is M. F. de Lombaerde; the Secretary M. François Peeters.

READING CHRYSANTHEMUM SHOW.

WE are requested to state that Mr. Garner, The Gardens, Amberwood, Christchurch, was awarded the second prize in the class for forty-eight cut blooms at Reading Chrysanthemum Show, and not third, as given in our report last week. Mr. Garner has also succeeded in finally winning the silver challenge cup at the Lymington Chrysanthemum Show, and several medals at other Exhibitions.

CHRYSANTHEMUMS AT BARKBY HALL, LEICESTERSHIRE.

MR. BROOKS, the proprietor of this seat, has one of, if not the best, collections of Chrysanthemums in the country; and the Leicester and Midland Chrysanthemum Society, which was fortunate enough to secure Mr. Lansdell, the head gardener, as judge, and by the same act unfortunately lose an extensive and strong exhibitor. This week I had the pleasure of looking over the "mums" under his care, and was deeply impressed by the very healthy look of the plants, also by the excellence of the blooms. The incurved varieties are the best I have seen in the county this season. Amongst others were Queen of England, Lord Alcester, Golden Empress, Alfred Salter, Mrs. Coleman, Princess of Wales, Miss Haggis, and Lord Wolseley. Half a dozen blooms of any of these could be cut quite up to exhibition mark. The Japanese have grand representatives in Mrs. E. W. Clarke, Vivian Morel, Sunflower, Comte de Germiny, Avalanche, Edwin Molyneux, W. W. Coles, Macame Baco, George Daniels, Puritan, Gloire de Rocher, Val d'Andorre, and W. H. Lincoln, some of which could give a dozen specimen blooms; while of Etoile de Lyon fully twenty blooms could be cut as fine as any I have seen on a show board this season. Stanstead White is remarkably good, so are Mrs. Irving Clark, Sarah Owen, Madame J. Laing, and Madame Marie Hoste.

Mr. Lansdell has several rather pleasing sports, two of which are likely to prove acquisitions; the first being a bronze sport of Boule d'Or, and the second a pure yellow one of Maiden's Blush.—**W. BELL.**

THE TWICKENHAM SHOW.

IN the interest of gardeners in this district may I call attention to the following circumstances? I went by train on the evening 15th inst., arriving at the Town Hall about 7 P.M. The charge at the door was 1s., which I paid. After inspecting the plants in the large room I went to the rooms above to see the cut blooms, fruit, vegetables, and other exhibits, when, to my surprise, also to the surprise of other visitors, the police ordered us out of the hall and locked the doors of these two rooms. On arriving at the bottom of the staircase there sat the Honorary Secretary, who informed us that we might have re-admission to the large room, where a concert was about to commence, by paying an additional 2s. 6d. Myself and others had come to see the exhibition, but were prevented doing so, and had to leave the hall by 7.30. To advertise the show without publishing the conditions on which it can be seen appears to me very extraordinary. I paid to see the exhibition and was abruptly turned out before seeing it. Enclosed please find a schedule with the balance sheet for 1891. I see that the Horticultural Society are charged with a concert to the amount of £17 7s., and that the takings at the door amounted to £18, tickets sold £1. I think gardeners should be made aware of these facts. I also enclose a copy of an advertisement cut from the *Surrey Comet*.—**G. S.**

[The advertisement announces the show and also mentions evening promenade concerts, but neither states the time for opening and closing the rooms, nor the price of admission to either the show or the concert. It is signed by the Honorary Secretary of the Horticultural Society. The accounts were audited by Messrs. G. J. Duncan and W. Bates, members of the Committee, and are no doubt correct. We presume the prices for admission were published on handbills or in some other way. There is certainly no mention of them in the advertisement before us.]

CHRYSANTHEMUMS AT THE BIRMINGHAM GARDENERS' ASSOCIATION.

AN "Exhibition night" of the Society took place on the 14th inst., when new Chrysanthemum blooms and a discussion were invited. Mr. Robert Owen, Maidenhead, sent a few new sorts, but evidently grown on small plants. A daylight inspection next morning enabled the following notes to be taken:—The Bride, incurved, pure white, a beautiful flower of first-class quality; a certificate was awarded to it. Seedling

Incurved A. 42, a distinct golden bronze or brass colour, a shade known as old gold; florets rather narrow, but well incurved and promising. Robert Pitfield, incurved, rosy lilac, with a lighter, silvery shade of colour; a fine, distinct variety. Baron Hirsch, incurved, reddish chocolate, tipped with bronze; a handsome, bright, and distinct flower of fine form. John Fulford, incurved, was not in good character and sufficiently open. Lucy Kendall, incurved, a sport from Violet Tomlin; very pretty in colour, but the flower was small and not in character. Incurved Japanese Viscountess Hambledon, delicate pale lilac, flushed with white, a satin-like surface. An incurved Japanese, a very promising flower of a warm, rich, bronzy orange tint, was also sent; a pleasing distinct shade of colour, with broad florets and fine form.

A bloom of a seedling marked "White Fringed" was also sent, and which reminded one of old "Marabout." It is a new type, the flower pure white, nearly half globe shaped, and that sent was 3 inches in diameter, very double, each floret being quilled as in the flowers of the double *Gaillardia picta Lorenziana*, with *Bouvardia*-like segments at the points, and it is a pleasing flower. A cultural certificate was awarded to three very fine blooms of Colonel B. Smith, a fine Japanese variety sent out last year by Mr. C. E. Harvey. A cultural certificate was also awarded to Mr. Dideott for two dwarf plants of W. H. Lincoln from cuttings struck at the end of May, and were about 18 inches high, with three good blooms on each.

[Chrysanthemum growers will naturally wish to know whether the certificates referred to were awarded to single blooms, or two or three of each variety.]

CERTIFICATED CHRYSANTHEMUMS.

A MEETING of the Floral Committee of the National Chrysanthemum Society was held at the Royal Aquarium, Westminster, on Wednesday, November 23rd. Many new varieties were brought on the table, but the majority of them were passed. First-class certificates however, were awarded as follows:—To Mr. E. Molyneux, Swanmore Park Gardens, Bishop's Waltham, for Mrs. Mitchell, an incurved variety that has already been described in these pages; to Messrs. H. Cannell and Sons, Swanley, Kent, for Kentish Yellow, a charming reflexed Japanese of a bright yellow colour; to Mr. R. Owen, Maidenhead, for Waban, an incurved Japanese, large in size and rosy mauve colour, light centre; Robert Owen, an incurved Japanese of a rich apricot shade, very telling; and Mrs. Bruce Findlay, a light pink Japanese, with narrow florets; to Messrs. Pitcher & Manda, Hextable, Kent, for Primrose League, a creamy white Jap with a yellow centre.

Several varieties the Committee wished to see again, including Southern Beauty, a Japanese resembling Lizzie Cartledge, from Messrs. H. Cannell & Sons; Garnett, an incurved Japanese from Mr. E. Rowbottom, The Priory, Hornsey; Frank Webb, an incurved variety shown by Mr. Wells, Earlswood Nurseries, and Mrs. Dr. Ward an incurved Jap from Messrs. Pitcher & Manda. Tribune (yellow) and Mrs. W. Cutting (rose colour), incurved Japs, shown by Messrs. Pitcher & Manda were commended. Mr. C. E. Shea, The Elms, Foot's Cray, sent a number of novelties.

LORD BROOKE.

THE variety which fig. 62 represents was sent out last season, but it was then known to comparatively few, and even during the present season it has not been seen on so many occasions as to warrant the assumption that it is yet well known to the public. Few more distinct Chrysanthemums have been introduced, and if it manifests the improvement that may reasonably be expected of it another year it will soon find a place in the front rank. If, like Mons. Bahuant, it could be fairly classed amongst the incurved, its value would be greatly increased; but this is extremely doubtful. So far it displays too strongly the characters of a genuine Japanese-incurved to be eligible for the pure incurved section. The florets are of enormous substance, being very broad and thick, excelling those of the substantial variety just named. Messrs. Pitcher & Manda, the introducers of the variety, showed a bloom at the Crystal Palace Show, where no certificates were awarded for single blooms. Mr. Rowbottom of The Priory Gardens, Hornsey, has produced some very fine flowers, from one of which our illustration was prepared. Messrs. Cannell & Sons also had bright examples at the last Drill Hall meeting, when the R.H.S. gave an award of merit to the variety.

The colour may be described as rich apricot smeared with crimson, a combination which sounds distinctive, and which is as beautiful as it is novel. The plant is a sturdy grower, medium to dwarf, with very broad substantial foliage. As a good grower and a variety with many distinct characters we shall await the appearance of Lord Brooke next year with considerable interest, for there appear to be in it the qualities that constitute a distinct acquisition.

CHRYSANTHEMUM SHOWS.

NEW YORK (U.S.A.).—NOVEMBER 1ST TO 7TH INCLUSIVE.

THIS large Exhibition, held in the Madison Square Gardens under the auspices of the New York Florists' Club, was a pronounced success. The *élite* of the City attended. The building is an excellent one. It is

an immense size, arena shape, lofty, surrounded by boxes or stalls, balconies and galleries. It has a fine glass roof, and is well lighted with electricity, which, aided by the coloured lights and Japanese lanterns, a lofty fountain playing in the centre and surrounded with Palms, and the bright display of the Chrysanthemums, the drapings and festoons of the autumn leaves, Conifers, garlands of Clematis and Ivy, helped to produce a fairy-land aspect. The New York Florists' Club liberally awarded £1300 in prizes.

As the visitor enters the main entrance he stops at the large group of Palms and foliage rather heavily arranged by Siebrecht. Surrounding this are circular groups of standard and pyramid trained specimens of Chrysanthemums. Several were a credit to the cultivator, but on a whole needed improvement in culture and training. Following on are the numerous tables arranged in semicircles, and upon which are shown in enormous glass and earthenware vases large numbers of cut blooms of the leading varieties bunched in separate colours.

The flowers were exhibited with their foliage, the stems being 4 to 5 feet long, and had a fine and natural effect. This is a style Britishers might adopt with success. The method in cups and tubes is not looked upon with favour here. On each side groups of Chrysanthemums in pots were staged. Particularly striking were dwarf well-foliaged plants in 5 and 6-inch pots. The plants were from late-struck cuttings and carried grand flowers. After passing an immense group of Palms and other plants corresponding with the other end of the building, I paused to look at the striking exhibit made by Messrs. J. H. Small & Sons, florists, of Washington, who have just opened a branch in this City. The entire east end of the room was occupied by this exhibit.

In the centre was an enormous Columbus arch 45 feet in height and covered with white cloth. The panels of the sides and the top corners were inset with Ivy, and in the centre of each a Japanese fan of Chrysanthemums. The arch was surmounted with miniature representations of Columbus's fleet. On the right of this was an elaborate decoration of a church wedding, chaste and pretty, surmounted with white and pink Chrysanthemums like a canopy. Then on the left a life-like model reproduction of the capitol at Washington. It was 20 feet by 12 feet high, and is covered with light green cheese cloth. The whole is surmounted by a gilded Goddess of Liberty. It was the work of a clever young English boy, and done entirely from a photograph. Orchids and collections of plants were shown well by several firms. Cannas were also exhibited in splendid condition.

Seedling Chrysanthemums were exhibited at the close of the Show, but as this report is being written during the first days of the Exhibition, I have not yet (at the time of writing) had an opportunity of ascertaining what advance has been made by our Yankee cousins. I must state, however, that Golden Wedding of Peter Henderson & Co. is by a long way the finest and largest golden yellow Japanese incurved I have ever seen. It was awarded the first prize for the best variety in the Show. Messrs. John Laing & Sons, Forest Hill, have secured the European control of this grand sort.

Amongst the English trade visiting the Show I noticed Mr. Waterer from Messrs. John Waterer & Sons, Bagshot; Mr. A. Duminck of Messrs. F. Sander & Co.; Mr. A. Ingram from Messrs. Hugh Low and Co.; and Mr. J. H. Laing from Messrs. John Laing & Sons, Forest Hill. —VISITOR.

ISLE OF WIGHT.—NOVEMBER 8TH AND 9TH.

THE advantages of a late season was plainly visible in both the cut flowers and plant classes, and the present must be considered the best of the many excellent exhibitions held by this long established and extensively patronised Society.

With the exception of the nurserymen's classes all was above the average, the cottagers' especially, and though some of these have only verandahs or some temporary structure to bloom their plants the majority of the cut blooms staged would have done credit to any first-class exhibition. A bloom of M. H. Bahuant, exhibited by a cottager (Mr. Jacobs) and produced under a verandah, was one of the best of the kind we have seen this season. The same exhibitor had remarkable blooms of Japanese a long way ahead of anything we are accustomed to see shown by cottagers.

In the open class for twenty-four blooms, distinct, twelve Japs and twelve incurved, Mr. Wilkins, gardener to W. Ridley, Esq., was deservedly awarded the first prize, staging large and handsome blooms of F. Davis, Mrs. J. Clark, Mr. E. W. Clark, Vivian Morel Comtesse de Beauregard, Belle Paule, Etoile de Lyon, W. G. Drover, Golden Dragon, Mdle. Marie Hoste, Madame Clemence Audiguer, and Boule d'Or. His incurved were Jeanne d'Arc, Golden Empress, Queen of England, Lord Alcester, Jardin des Plantes, John Doughty, Miss M. A. Haggas, Princess of Wales, Hero of Stoke Newington, Charles Gibson, Alfred Salter, and Nil Desperandum. Mr. Gash, gardener to Sir B. Simeon, was a very fair second; and Mr. Tolley, gardener to S. E. Ridley, Esq., a close third.

Mr. Wilkins was also first for twenty-four incurved—a very fine stand; and Mr. Gash a good second. For twenty-four Japanese there was a very spirited competition; first honours fell to Mr. Miller, gardener to Mrs. Brook-Firman, East Cowes, for a splendid collection, consisting of Mons. Bernard (good), George Daniels, W. W. Coles, Condor, Val d'Andorre, Etoile de Lyon, Ralph Brocklebank, Condor, Puritan, Gloriosum, Baronne de Prailly, Sunflower, Avalanche, Vivian Morel, Edwin Molyneux, M. Baco, Mrs. J. Wright, W. Stevenson, Stanstead

Surprise, Sarah Owen, Eynsford White, M. Baco, and W. H. Williams. Messrs. Sheppard and Gash were second and third respectively. All the other cut bloom classes were well contested.

Coombs, Blake, Cheverton, and Williams in the cottagers' classes. The arrangements were admirably carried out by the Committee, prominent amongst which were Dr. Groves, J.P., the Chairman; Dr.

FIG. 62.—CHRYSANTHEMUM LORD BROOKE. (*From a Photograph.*)

Messrs. Linnington, Cooper, and Matthews were the most successful exhibitors in the amateurs' classes; and Messrs. Jacobs, Tomlinson, Coombs, the Treasurer; Mr. Cave and Mr. Horace Groves, the energetic Secretary.

CARDIFF AND DISTRICT.—NOVEMBER 9TH AND 10TH.

THE above Society had a most successful Exhibition. The cut blooms throughout were of a high order of merit, though a week later would have found the incurved stronger. Ten entered in competition for the class for forty-eight blooms, not less than thirty-six varieties. Sir Chas. Philips, Picton Castle, Haverfordwest (gardener, Mr. Dumble), stood first with superb blooms. His best incurved were John Doughty, Alfred Salter, John Lambert, Prince Alfred, Lord Alcester, Mons. R. Bahuant, and a magnificent Mrs. Robinson King. Japanese: Mrs. J. S. Fogg, Mrs. Alpheus Hardy (splendid), Florence Davis, Boule d'Or, Avalanche, Vivian Morel, M. A. E. Carrière, Mrs. F. Jameson, Puritan, and a very fine Mrs. Libbie Allen. T. J. Masters, Esq., Llantrissant (gardener, Mr. Howe), was second; and V. Stuckey, Esq., of Langport (gardener, Mr. J. Lloyd), was third. Many good blooms were noticeable in the unsuccessful stands, the Japanese being decidedly the best.

Mr. Howe was first for twenty-four distinct varieties, Mr. J. Lloyd taking second. For twelve Japanese in the amateurs' class Captain Marling, Lydney (gardener, Mr. McDonald), was first with a capital stand, Vivian Morel being particularly fine. J. Howells, Esq., The Walk, Cardiff (gardener, Mr. Horton), was second; and Mr. Lloyd third. Mr. McDonald was first also for twelve incurved; Mr. Lloyd second; and Col. Page, Llandaff (gardener, Mr. Hockey), third. Twelve Anemones failed to draw more than one competitor, Mr. Dare, gardener to Nugent Wells, Esq., Newport, who was awarded a prize. For six of one variety Mr. Dumble took first prize with superb blooms of Madame Baco; the Earl of Lisburne (gardener, Mr. Williams) taking second with very fine blooms of Mdle. Lacroix. Two special prizes were awarded for the best single blooms. One was taken by Mr. Dumble, and the other by Mr. Williams, gardener to Lord Lisburne, both showing Vivian Morel, somewhat light in colour, but of large proportions and fine in quality. A challenge cup, given for the best twenty-four distinct varieties, was won by Mr. Dumble, and followed by Mr. Williams.

Groups of Chrysanthemums arranged for effect were numerous and good. Mr. Drake was first, followed by Messrs. Treseder and Case for second and third. The first prize for group in the amateurs' class was taken by Mr. Hockey with dwarf and well-furnished plants, carrying good heavy blooms. Mr. Pinches, gardener to J. C. Hacquoit, Esq., was second. Mr. Clarke, gardener to Col. Sir Edward Hill, Bart., of Llandaff, was first for group of miscellaneous plants; and Mr. Ryder, gardener to M. Gunn, Esq., Llandaff, second. Mr. Ryder and Mr. Kelly were successful for foliage Begonias, very large specimens being exhibited. Mr. Malpass, gardener to C. E. Jenkins, Esq., Penylan, took first for stove and greenhouse Ferns; whilst for Ferns in 6-inch pots Mr. Rex, gardener to C. Waldron, Esq., was first.

Fruit was well shown. Mr. Spencer was first for a collection, Mr. Lloyd second, and Mr. Boudege, gardener to Col. Gaskell, Newport, third. Mr. Spencer, Mr. Julian, and Mr. Kelly were successful with dessert, and Mr. Hockey, Mr. Spencer, and Mr. Julian for culinary Apples. Pears were best shown by Messrs. Julian, Hockey, McDonald, George Hawkins and Boudege. Mr. Lloyd took first prize for black Grapes, whilst for white Mr. Greateorex was first.

The winner of the N.C.S. silver medal was Mr. Howe, gardener to T. J. Masters, Esq., for six Jap blooms, and the N.C.S. certificate went to Mr. Dumble, Sir C. Philips, Bart., for best bloom in Show, and Mr. J. Blake for best plant in the Show.

The judges awarded a special commendation to Messrs. W. Clibran and Son of Altrincham for an honorary exhibit of cut blooms and hardy fruit.

GLOUCESTER.—NOVEMBER 9TH AND 10TH.

THIS annual Exhibition was held at the Corn Exchange, and proved a decided success, all the exhibits showing good quality. Chrysanthemums were not so extensively staged as last year, but the quality was better. The large group put up by Mr. Sowray, gardener to Mrs. Gambier Parry, was the best we have seen anywhere, either in London or the provinces. The group was light, beautifully arranged as to colour, and the plants perfect with foliage down to the pots, each bloom standing out clear above the dark green leaves; it well deserved the first prize awarded.

Mr. Sowray was also first for twenty-four cut blooms, distinct, twelve incurved and twelve Japanese. This stand comprised—Japanese: Sunflower, Avalanche, Japonaise, Gloire du Rocher, Madame C. Audiguier, W. H. Lincoln, Stanstead White, E. Molyneux, Florence Percy, Vivian Morel, Mrs. H. Cannell, and Louis Boehmer. Incurved: J. Lambert, J. Salter, White Venus, Alfred Salter, Jeanne d'Arc, Camille Flammarion, Golden Empress, Lady Hardinge, Empress of India, Queen of England, M. R. Bahuant, and Violet Tomlin. W. Meath Baker, Esq., Hasfield Court, Gloucester (gardener, Mr. Aplin), was a very good second. In the twelve bloom class Mr. Sowray and Mr. Aplin took the prizes in the order named. In the Anemone class, C. Lee Campbell, Esq., Glewston Court, Ross (gardener, Mr. S. T. Wright), took premier position, Mr. Aplin being second.

Fruit was well shown all through. In the Grape classes Mr. Sowray, Mr. Wright, and Mr. J. H. Jones, Barrow Hill, Churchdown, took the principal prizes. For the best and most profitable sorts of Apples, limited to tenant farmers within the county of Gloucestershire, Mr. T. Morris, Maisemore Court, was first with a very good collection. For twenty-four dishes of Apples, distinct, prize given by Mr. J. Watkins, Mr. Wright was first, and Mr. Aplin second. For a collection of dessert Apples the English Fruit and Rose Co., Hereford, were first, showing

fruit in splendid condition. Mr. Wright was second with a large highly coloured collection. For twelve Ashmead's Kernel, Mr. Wright took first prize; the English Fruit and Rose Co. second. For Ribston Pippins Mr. Wright was first, and Mr. T. Morris second. With twelve Cox's Orange Pippin the English Fruit and Rose Co. were first, and Mr. Wright second. The same exhibitors were the most successful in the remaining single dish classes. For a collection of culinary Apples the English Fruit and Rose Co. were first, and Mr. Wright second. For collections open to tenant farmers only Messrs. Morris, Phelps, Tibberton, were the most successful. With dessert Pears Mr. Wright was an easy first in every class, Mr. Sowray coming next. Mr. J. Watkins, Pomona Farm, Hereford, staged a splendid collection of Apples, not for competition.

Vegetables were well staged by Mr. F. Williams, High Street, Thornbury, and Mr. Aplin. Potatoes were not so well shown as we have seen them at Gloucester, being in many cases rather coarse.

A special feature of this Show was a remarkably fine collection of Cyclamens put up by Messrs. Sutton & Sons, Reading. The plants were in 5-inch pots, which were almost hidden by the splendid marbled foliage, forming a fine groundwork for the large and brilliant blooms. It was generally acknowledged that such a fine display had never been seen before in Gloucester, and they justly merited the six certificates awarded.

The Society are to be commended for doing all in their power to encourage farmers in fruit culture, as they give liberal prizes to tenant farmers within the county, and the improved quality of the fruit staged by them indicates that their efforts are being crowned with success.

BOURNEMOUTH.—NOVEMBER 9TH AND 10TH.

WITH four valuable silver challenge cups and numerous substantial money prizes it is not surprising that there was a close competition in nearly all the eighty-five classes which comprised the schedule of this noted Exhibition. The entire absence of all second-rate and stale flowers throughout the Show was a marked improvement. In the group classes there were no less than sixteen groups staged, all being highly commendable for their freshness, quality, and arrangement.

For a group of Chrysanthemums, arranged in a space of 60 feet, Messrs. Watts & Sons, nurserymen, Bournemouth, were awarded the premier position for a meritorious collection, the flowers being massive and fresh, while the foliage was of the brightest green, feathered down to the pots, all the plants being of medium height. Mr. T. K. Ingram was placed second with very dwarf plants, carrying good flowers; and Mr. E. Blanchard, Poole, third. For groups of 50 feet Mr. J. Stretch, gardener to Miss Evans, was placed first; Mr. Shave, gardener to W. W. Moore, Esq., second; and Mr. F. J. Ellis, gardener to L. Forbes, Esq., third, all exhibiting admirable collections. In the single-handed gardeners' class, for 30 square feet, Mr. C. Frampton, Winton, secured first honours and the N.C.S. silver medal and certificate for a splendid arrangement, while Messrs. Newell and Barge were placed second and third respectively. Mr. Thurle, Holdenhurst, secured the amateurs' challenge cup for a collection. The other plant classes were well filled, and contained generally some very creditable specimens.

Cut blooms were excellent. In the class for thirty-six and eighteen Japanese and eighteen incurved, not more than two of any variety. Mr. J. W. Taylor, gardener to T. P. Elphinstone, Esq., Cranmoor Lodge, Christchurch, was first, and Mr. N. Molyneux, gardener to G. Garnier, Esq., Fareham, a close second. Mr. Molyneux's incurved were both neat, solid and fresh, while many of his Japanese were wanting in the same qualities. On the other hand Mr. Taylor's Japanese were both solid and fresh, and had the additional advantage of possessing more variety of colouring, but his incurved were not on the whole quite so neat and solid as Mr. Molyneux's. Mr. Taylor's stand consisted of—Japanese: Vivian Morel (2), Mrs. F. Jameson Etoile de Lyon (2), E. Molyneux, M. Pigny, Mrs. C. H. Wheeler, Madame Baco (2, fine), Sunflower (2, good), Japonais, Avalanche, Louis Boehmer (2), Boule d'Or, and Thunberg. Incurved: Golden Empress (2), Queen of England (2), Emily Dale, John Doughty, John Lambert, Violet Tomlin (2), Princess of Wales (2), Miss M. A. Haggas (2), Empress of India, Prince Alfred, Mrs. Heale, Lord Wolseley, and Mr. Brunlees. Messrs. E. Watts & Son were placed third. For twelve Japanese (distinct) Mr. Taylor was again placed first with Vivian Morel, Avalanche, Golden Dragon, M. Pigny, Mrs. F. Jameson, Baronne de Prailly, Etoile de Lyon, Carew Underwood, Meg Merrilies, Mons. Elliott, Japonais, and Madame Baco. Mr. Molyneux and Mr. Garner (gardener to Mrs. Braddy) shared the other prizes in the order of their names.

For twelve incurved distinct, Mr. Taylor staged Lord Alcester, Alfred Salter, John Lambert, Queen of England, Violet Tomlin, Golden Empress, Empress of India, Princess of Wales, Mrs. Heale, Mr. Brunlees, Miss M. A. Haggas, and Prince Alfred, which secured him the first prize. Mr. Molyneux was a very close second, his Mrs. S. Coleman, Princess of Wales, and Mrs. Heale were particularly neat and good. Mrs. Braddy was third. A magnificent and highly coloured bloom of Vivian Morel from Mr. Taylor gained the prize as being the premier Japanese bloom in the Show, and a like award was made to Mr. Molyneux for a splendid bloom of Lord Alcester.

Anemones were well shown by Mr. Skinner, gardener to Major Stuart-Wortley, and the best reflexed was shown by the same exhibitor; Messrs. Reeve and Hankinson took the other awards. Other successful competitors in the other cut bloom classes were Messrs. Mills, Ricardo, Stuart, Reeve, Petherick, Burrows, Squires, and Armfield.

Fruit and vegetables were grand, while buttonholes, sprays, bouquets, and table decorations all helped to swell the attractions of a magnificent display, which our space will not allow us to particularise. It was, taken collectively, a grand Show and well managed by Mr. Spong, the Secretary, ably supported by members of the Committee, especially by Messrs. Brown, Swaffield, and Way. Upwards of £132 were taken at the doors, some 2000 persons being admitted on the second day for 3d. each.

REIGATE AND DISTRICT.—NOVEMBER 11TH.

THE fourth Exhibition of the above was held on the above date in the Public Hall, Reigate, and was in every way a decided success.

For a group of Chrysanthemums not exceeding 50 feet, Mr. J. Brown, gardener to Mrs. Waterlow, was first with a magnificent arrangement, the quality of the flowers being very fine, and the foliage all that could be desired. This also received a certificate. Mr. H. Bailey, gardener to W. S. Barklay, Esq., was second for a very fine group; and Mr. J. Hoad, gardener to J. Simpson, Esq., third for a smaller arrangement. Mr. Peters, gardener to W. Finch, Esq., was placed first, and Mr. E. Tickner second for specimens, both showing good plants. Standards were not very largely staged. Mr. W. Hamilton, gardener to Mrs. Grice, was the most successful for four bush specimens; and Mr. J. Brown exhibited four fine plants of Avalanche, Hamlet, Mdle. Lacroix, and Val d'Andorre, the flowers being of excellent quality.

The class for thirty-six Japanese blooms, distinct, was a grand feature. The flowers were of the very finest quality. The first place was assigned to Mr. C. Ritchings, gardener to Dr. Frankland, F.R.S., for a very fine stand of the following:—Back row: Vivian Morel, E. Molyneux, W. H. Lincoln, F. Davis, Alberic Lunden, Boule d'Or, Stanstead White, C. G. Schwabe, W. Tricker, Coronet, Baronne de Prailly, and Madame Marie Hoste (very fine, and was the best bloom in the Show). Middle row: Avalanche, Vice-President Audiguier, A. H. Neve, Gloire de Rocher, R. Brocklebank, Lady Lawrence, Mons. Freeman, Soleil Levant, Elaine, Val d'Andorre, E. Beckett, and Madame J. Laing. Front row: Sunflower, Louis Leroy, M. C. Audiguier, S. Owen, M. Darquier, Thunberg, Madame Baco, Mons. Bernard, Etoile de Lyon, Mdle. Lacroix, Puritan, Mrs. Wheeler. Mr. C. J. Salter, gardener to T. B. Haywood, Esq., was an extremely close second, only a point or two dividing them. Exceptionally fine were W. H. Lincoln, E. Molyneux, Sunflower, and E. Beckett. For twenty-four Japanese, Mr. J. Ormiston, gardener to J. Colman, Esq., was first; Mr. A. Hayter, gardener to Lady Somerset, second; Mr. Bailey third; and Mr. J. Colton fourth, all showing grand blooms. For twelve distinct, Mr. E. Tickner was a good first with particularly fine even fresh flowers. Mr. W. Hamilton second; and Mr. W. S. Congrave, gardener to Mr. Crawford, third, with fine blooms also. Six Japanese, one variety, brought out a strong competition. Mr. Ritchings staged very fine blooms of Avalanche; Mr. J. Brown and Mr. Hayter, Sunflower, and were placed in the order of their names.

For twenty-four incurved, distinct, Mr. Ritchings was again first with blooms of first-rate quality. Back row: Empress of India, Golden Empress, Queen of England, Prince Alfred, Mr. R. King, Golden Queen, Mons. R. Bahuant, and Lord Alcester. Middle row: Violet Tomlin, Princess of Wales, Nil Desperandum, Jeanne d'Arc, Lord Wolseley, Alfred Salter, Miss M. A. Haggas, and John Doughty. Front row: Mrs. W. Shipman, Mr. Bunn, Mrs. Coleman, Mabel Ward, Princess Teck, Jardin des Plantes, Lady Hardinge, and Cherub. Mr. J. C. Salter was a good second.

For twelve distinct Mr. C. Blurton, gardener to H. C. Boussen, Esq., Mr. G. Ormiston, and Mr. J. Cotton were first, second, and third respectively with well developed blooms. For six of one kind Mr. Ritchings again proved invincible, being well ahead with Golden Empress. These must rank amongst the finest incurved flowers staged this season, being of great depth, highly coloured, and perfectly fresh. Mr. Ormiston was second with good blooms. The reflexed and Anemone made a fine display, Mr. Salter showing in fine form, and winning easily in both classes for twelve.

Primulas, Cyclamen, and table plants also made a good show. Messrs. J. Smith (gardener to W. R. Inglis, Esq.), Hayter, and Blurton, were among the most successful.

GRASSENDALE AND AIGBURTH.—NOVEMBER 12TH.

THE second annual Chrysanthemum and Fruit Show was held on the 12th in the Parish Room, Grassendale. The exhibits were equal in every respect to last year. In the cut bloom classes the entries were not so numerous as might have been expected. This year much interest was taken in the class for twenty-four blooms for the prize offered by the President, A. L. Jones, Esq., Oaklands, Aigburth—viz., a silver cup valued at 10 guineas, to be won two years in succession, or three times in all. Three staged, Mr. Donald Forbes, gardener to Alfred Holt, Esq., Crofton, Aigburth, being a somewhat easy winner with a stand comprising Japanese: Vivian Morel, Etoile de Lyon, Stanstead White, Boule d'Or, Mons. Bernard, Avalanche, Mdle. Marie Hoste, Edwin Molyneux, Sunflower, Lilian B. Bird, Florence Davis, and W. W. Coles. Incurved: John Lambert (fine), Golden Empress, Lord Alcester, Alfred Salter, Mrs. Robinson King (good), Queen of England, John Doughty, Violet Tomlin, Mrs. S. Coleman, Mrs. Heale, Mr. Bunn, and Jeanne d'Arc. The second prize went to Mr. P. Green, gardener to L. H. Macintyre, Esq., Riversdale Road, Aigburth; and the third, Mr. J. Agnew, gardener to Mrs. Watts, Grassendale Park. For six Japs and six incurved, distinct, Mr. Grant, gardener to W. S. Gladstone, Esq., Mersey Road, was first, and Mr. A. Lewis, gardener to T. Neal, Esq.,

Beechwood Road, Aigburth, second. The former was also first for six Japanese, distinct; whilst Mr. P. Green was successful for six incurved, and three Japanese and three incurved.

The groups not to exceed 40 feet were fairly well shown, Mr. A. Lewis and Mr. J. Harrison, gardener to Mrs. W. G. Bateson, Elmhurst, Aigburth, being first and second. The latter was first for three trained Chrysanthemums; Mr. J. Madeley, gardener to W. C. Atkinson, Esq., St. Anne's Road, Aigburth, being first for three and one staked Chrysanthemum. Fruit was well staged, the Grapes exhibited by Messrs. Bounds and Leadbeater being particularly fine. There were placed not for competition a fine *Oncidium tigrinum* from Mr. J. Bounds; a group of Palms from Liverpool Horticultural Company, Ltd.; Palms, Crotons, and a variety of ornamental plants from Messrs. Ker & Sons, all of which received the certificate of merit.—R. P. R.

HARTLEPOOL.—NOVEMBER 13TH AND 14TH.

THE fifth Show was held in the Armoury, and was in every sense a thorough success. Groups of Chrysanthemums were a capital feature of the Show. The first prize went to Mr. T. Smith, West Hartlepool; the second prize being secured by Mr. A. Taylor, Broomhall, West Hartlepool. Miscellaneous groups were composed of the usual class of decorative plants remarkable for health and vigour, the Crotons being highly coloured. Mr. J. Hall, The Willows, was first; Mr. G. Farrow second, Mr. J. Patterson third. Double and single Primulas were staged in fine condition; baskets of cut Chrysanthemums made a gay display.

The President of the Society, Alderman Pyman, offered a very handsome silver cup for twenty-four blooms, twelve incurved and twelve Japanese. This trophy was won by Mr. A. Taylor, Broomhall, with good flowers staged as follows:—Incurved: Lord Alcester, John Lambert, Alfred Salter, Queen of England, Jeanne d'Arc, John Doughty, Empress of India, Lord Wolseley, Prince Alfred, Queen of England, Emily Dale, and Venus. Japanese: E. W. Clark, Condor, Sunflower, Edwin Lonsdale, Puritan, Etoile de Lyon, E. Molyneux, Bouquet des Dames, and Louis Boehmer. In this stand was found the premier incurved bloom in Lord Alcester, and also the premier Japanese in E. W. Clark, showing less coarseness than usual. Mr. T. Smith, Grantully, West Hartlepool, was second, Mr. J. Hall third, and Mr. A. Taylor fourth with incurveds, but which had lost their freshness. Mr. A. Taylor was again first for twelve incurveds, and also for twelve Japanese.

Three competitors exhibited in the class for four bunches of Grapes, Mr. J. Hall securing first prize with good Gros Colman, Mr. A. Taylor coming second with the same variety, and Mr. A. Taylor third. Trays of vegetables were a good feature of the Show.

CUCKFIELD.—NOVEMBER 15TH.

THIS Show was opened on the above date in rather depressing weather, a drizzling rain prevailing the whole day. The exhibits were quite up to the average. Of three groups staged the lead was taken by Mr. Geo. Stringer, gardener to R. A. Burn, Esq., Horsgate, with a bright arrangement; Mr. J. Mitchell, gardener to Major Meterly (President of the Society) was second; and Mr. W. Fox, junr., an amateur, third with a very good first exhibit in this class. For a group of six plants with Ferns Mr. T. Burtenshaw, gardener to W. Payne, Esq., Hatchlands, was first; while Mr. J. Mitchell and Mr. Geo. Stringer were the most successful exhibitors of specimen plants.

The two open classes for Japanese and incurved blooms brought together some fine stands; the incurved varieties being noticeably better than at earlier shows this year. In this class Mr. S. Horscroft, gardener to T. Potter, Esq., Hapstead House, Ardingly, was successful with John Lambert, Violet Tomlin, Alfred Salter, Lord Alcester, Lord Wolseley, Mrs. S. Coleman, Prince Alfred, Miss M. A. Haggas, Golden J. Salter, John Salter, and Princess of Wales; Mr. J. Voss, gardener to W. Savill, Esq., The Ferneries, Lindfield, was second; and Mr. R. Inglis, third.

For twelve Japanese, Mr. Voss was placed first with splendid flowers of Etoile de Lyon, Boule d'Or, Condor, Vivian Morel, W. H. Lincoln, Geo. Daniels, W. W. Coles, Sunflower, Stanstead White, Puritan, Glorioso, and Florence Davis. Mr. S. Horscroft; Mr. J. W. Coles, gardener to Mrs. Nichols, Highley Manor, Balcombe; and Mr. T. Venn, gardener to W. Sturdy, Esq., Paxhill Park, Lindfield, followed in the order named. Mr. J. W. Coles took the lead in both incurved and Japanese local classes. Mr. J. Lingley, gardener to T. W. Best, Esq., was the only exhibitor of twelve reflexed blooms. Mr. Voss showed, not for competition, some very fine blooms of Etoile de Lyon. Mr. Coles also had some cut blooms, amongst which were some promising seedlings of this year.

Mr. Geo. Warren, gardener to — Dent, Esq., Balcombe Place, and R. Inglis were the only exhibitors of Grapes. Mr. Stringer was first for two dishes of dessert Pears; and Mr. P. Bennet taking the premier place for stewing Pears. Apples were well shown by Mr. Stringer; Mr. J. Sands, gardener to T. Bannister, Esq., Hayward's Heath; Mr. J. Umpleby, gardener to Mrs. Woodcock, Bolnore, and Mr. G. Jupp, gardener to F. Campbell, Esq., Brantridge, Balcombe. Vegetables were also good.

WATERFORD.—NOVEMBER 15TH.

THIS annual event took place at the large Assembly Rooms of the Town Hall, and the display of fruit, vegetables, plants, and Chrysanthemums was considerably above the average. Taking the last first as exciting most interest, the competition for a cup value £5, presented by

Captain Raymond De La Ber, Kilcronagh, near Waterford, brought out three strong competitors in the Earl of Bessborough, Piltown; Colonel Villiers Stuart, D.L., Dromana; and Mr. E. Robinson, Waterford. This was for twenty-four cut blooms, half Japanese and half incurved. We have never seen a competition so keen. However, by a few points Lord Bessborough got first; and Mr. Stuart second; Mr. Robinson being a good third. The first-prize stand contained Japanese: Etoile de Lyon, W. W. Coles, Ralph Brocklebank, Puritan, E. Molyneux, Duchess of Albany, Vivian Morel (finest bloom in the Show), Stanstead White, Maiden's Blush, Madame J. Laing, Avalanche (very fine), and Madame Bac. Incurved: Queen of England, Empress of India, Alfred Salter, Jeanne d'Arc, Princess of Wales, Golden Empress, Bronze Jardin des Plantes, Emily Dale, Empress Eugénie, Violet Tomlin, Jardin des Plantes, and Prince Alfred. As a rule in all classes incurved blooms were behind former years. Among Japanese remarkably good were Gloriosum, Mdle. Marie Hoste, and Ralph Brocklebank in Mr. De La Ber's Japanese class, which gained first prize for twelve. In Mr. Stuart's cup class we have seldom seen finer Golden Dragon, Puritan, Volunteer, and Pelican; while in the incurved Miss M. A. Haggas still maintains its reputation. Mr. C. E. Davey was a good second for twelve Japanese.

The groups deserve special commendation, being unusually good, and were shown by Mr. Davey, already named; Mr. Robinson, Newtown, and Mrs. McCanson, Ballina Hill, the prizes going in this order.

Remarkably fine trusses of three of single and double Zonal Pelargoniums were shown by Messrs. Davey and Robinson, already named, getting first prizes in that order.

The classes for dessert Apples and Pears were well filled, but Messrs. N. A. Belview and Mr. Snow got first and second in the former, and Mr. Power and Mr. R. T. Carew, Ballinamona Park, similarly in the latter. The last named gentleman had similar honours for baking Apples, and the former for home grown Oranges. The vegetable classes are always strong, and the competitors numerous, in Waterford. The Hon. Secretary got prizes for Carrots, Celery, Parsnips, Onions, and Leeks; Mr. N. A. Power for Cabbages, Lettuces, and Leeks; Mr. Carew for Cauliflower, Tomatoes, and Parsnips.

Mr. N. A. Power and Mr. R. T. Carew divided the honours in the field crops class, while the aforementioned gentleman and Mr. J. H. Jones, Mullinabro, got first and second for Messrs. Sutton's prize. The energetic Hon. Sec., C. Percival Bolton, Esq., Brook Lodge, was ably assisted by Mr. J. A. Power (Power & Son, nurserymen). The judges were Mr. A. Herne, Lismore Castle, and Mr. W. J. Murphy.

LIVERPOOL.—NOVEMBER 15TH AND 16TH.

"ONE of the greatest Shows ever seen in Liverpool" was the verdict of all those who paid a visit to the Exhibition held in St. George's Hall on the above dates. and the attendance, more especially on the first day, was sufficient to gladden the hearts of the Committee. The Show was visited by the Mayoress and the greater number of the leading ladies and gentlemen of the district.

CUT BLOOMS.—These are always the great centre of attraction, and they far exceeded any seen at previous autumn shows. There were 139 entries, as against 120 last year, and 2148 blooms were staged. In the large class for twenty-four Japanese and twenty-four incurved in not less than eighteen varieties each, Mr. Donald Forbes, gardener to Alfred Holt, Esq., Crofton, Aigburth, won first honours with magnificent stands of blooms. The back row Japanese were Etoile de Lyon (2), Ralph Brocklebank, Avalanche, Vivian Morel, George Atkinson, E. Molyneux, Florence Davis. Second row: Stanstead White (2), W. W. Coles, Lilian S. Bird (2), Sunflower, Mdle. Marie Hoste, Mrs. Irving Clarke. Front row: Vivian Morel, Puritan, Mr. George Herring, Florence Davis, Boule d'Or, Mons. Bernard, W. Tricker, and Sunflower. Incurved.—Back row: John Lambert (2), Lord Alcester (2), Queen of England (2), Empress of India, Golden Empress. Second row: John Doughty (2), Mrs. Robinson King, Alfred Salter, Golden Empress, Jeanne d'Arc, John Salter, Empress of India. Front row: Beauty, W. Beverley, Mr. Bunn, Princess of Wales, Mrs. S. Coleman, Mrs. Heale, Miss Haggas, and Miss Violet Tomlin. The second prize fell to Mr. G. Burden, gardener to Geo. Cockburn, Esq., Lingdale Lodge, Oxtun, whose best Japs were Vivian Morel, Mrs. E. W. Clarke, Lilian S. Bird, Etoile de Lyon, Mons. Bernard, and W. H. Lincoln. Incurved: John Lambert, John Salter, Lord Alcester, and Jardin des Plantes. The third was awarded to Mr. J. Jellicoe, gardener to F. H. Gossage, Esq., Camp Hill, Woolton, who was a capital third, his incurved blooms being very fine. Fourth, Mr. T. Carling, gardener to Mrs. Cope, Dove Park, Woolton.

The handsome challenge cup, with 10 guineas as first prize, which was presented by Messrs. Ker & Sons, Aigburth Nursery, to be won two years in succession, was, owing to the death of Mr. A. R. Cox, who won it last year, again offered for competition for thirty-six blooms—viz., twelve Japanese, twelve incurved, and twelve reflexed. It was won by Mr. Jellicoe with a beautiful stand of blooms as follows—Japanese: Stanstead White, Etoile de Lyon, Mrs. F. Jameson (very fine), Florence Davis (grand), Gloire du Rocher, Avalanche, Boule d'Or, G. C. Schwabe, a fine variety after the style of E. Molyneux, lighter in colour; Vivian Morel, Sunflower, Mons. Bernard, and a splendid Mdle. Marie Hoste. Incurved: Emily Dale, Empress of India, Lord Alcester, Queen of England, Alfred Salter, Golden Empress, M. R. Bahuant, John Salter, Mrs. Coleman, Beauty, Mrs. Heale, and Violet Tomlin. Reflexed: Chas. Delmar (2), Cullingfordi (2), Chevalier Damage (2), Dr. Sharpe (2), King of Crimson (2), and Golden Christine (2). Second honours fell to Mr. D. Heaney gardener to H. G. Schintz, Esq., Mossley House, Mossley Hill, who had also an admirable stand, prominent being Vivian Morel,

Mrs. Irving Clarke, Etoile de Lyon, E. W. Clarke, Empress of India, Madame Darrier, Violet Tomlin, E. Dale, Golden Christine, and Dr. Sharpe. Third, Mr. Jno. Edwards, gardener to Henry Tate, jun., Esq., Allerton Beeches, whose Japanese and reflexed were very good. Fourth, Mr. Geo. Haigh, gardener to W. H. Tate, Esq., Highfield, Woolton.

For eighteen incurved Mr. T. Healey, gardener to Colonel Wilson, Hillside, Allerton, staged a fine collection for first honours, the best being Golden Empress, M. R. Bahuant, Lord Alcester, Mrs. Coleman, Violet Tomlin, and Princess of Wales. Second, Mr. Donald Forbes; third, Mr. Jellicoe. For the same number of Japanese the latter exhibitor was placed first, having Mrs. F. Jameson, Mrs. Irving Clarke, and G. C. Schwabe. Second, Mr. Thos. Foster, gardener to J. Brancker, Esq., Green Bank, Wavertree; third, Mr. Donald Forbes. There were two classes for twelve incurved, one being taken by Mr. Donald Forbes, and the other by Mr. H. Howard, gardener to A. S. Mather, Esq., Woolton; the seconds being Mr. T. Elsworthy, gardener to A. R. Gladstone, Esq., Court Hey, Broad Green, and Mr. P. Green, gardener to L. A. Macintyre, Esq., Riversdale Road, Aigburth. For the corresponding classes in Japanese Mr. J. Williams, gardener to C. J. Procter, Esq., Boscobel, Birkenhead, and Mr. J. Broomes, gardener to Thos. Harrison, Esq., Belle Vale Hall, Gateacre, were accorded first honours, the former having perhaps the best twelve Japanese in the Show. For six incurved Mr. T. Wilson, gardener to O. H. Williams, Esq., 2, Fulwood Park, Aigburth, was first, whilst the same position was taken by Mr. Jno. Breen, gardener to John Mosford, Esq., Righi, Tattenhall, Cheshire, for six Japanese. The prizes for Anemones, reflexed, Pompons, the maiden class, and six blooms of any kinds went to Messrs. Broome, T. Foster, W. Livess, Broome, Darlington, and C. E. Turnock.

PLANTS.—In the groups and trained plants there was keen competition, especially in the class for three trained specimens. The first prize was won by Mr. J. Harrison, gardener to Mrs. W. G. Bateson, Elmhurst, Aigburth, who showed Mrs. George Rundle, John Salter, and Chevalier Damage. Second, Mr. W. Wilson, gardener to H. Cunningham, Esq., Gorse Cop, Gateacre. Third, Mr. John Rose, gardener to J. G. Kitchen, Esq., Fernwood, Huyton. For three Pompons, Mr. Harrison was first. Mr. Harrison was also first for one Pompon. For one large-flowered Mr. E. Wharton, gardener to J. Findlay, Esq., Mavis Court, Sefton Park, was first, whilst the prizes for one standard, one pyramid, and one untrained went to Mr. T. Gower, gardener to J. A. Bartlett, Esq., Lynton, Mossley Hill. Mr. E. Bennett, gardener to J. E. Gordon, Esq., Dadlow House, Wavertree, was first with six untrained. The groups were the best ever seen here. For one 60 feet Mr. T. Winkworth, gardener to R. Brocklebank, Esq., Childwall Hall, was an easy first, his group being admirably balanced in every way, and very fresh. Mr. T. Moorhouse, gardener to R. Brocklehurst, Esq., Sandfield Park, was a good second; and Mr. J. Lowndes, gardener to S. S. Parker, Aigburth third. Stove and greenhouse plants were admirably staged by Messrs. Jellicoe, Healey, Moorhouse, and Bracegirdle; Orchids by Messrs. Bounds, Osborne, Bracegirdle, and Foster; and bouquets by Messrs. R. Pinnington, Gower, Jellicoe, Lewis, and Bowring.

Messrs. Bennett, Elsworthy, Barker, Wilson, Livess, Carleton, Grey, Middleton, Broome, Pinnington, Hannagan, Kelly, Winkworth, Mackarell, and Rev. L. Garnett distinguished themselves in the fruit classes; and an extra prize was awarded to Mr. R. Pinnington for a basket of Tomatoes.

Certificates of merit were awarded to Messrs. T. Davies & Co., Wavertree, for a collection of plants; Messrs. R. P. Ker & Sons for Cyclamen—one of the features of the Exhibition; to the Liverpool Horticultural Co. for Orchids and other plants; to Mr. H. Middlehurst, Manchester Street, for Mignonette, very dwarf; to Messrs. Dicksons, Limited, Chester, for an extensive and fine collection of Apples; and to Messrs. J. Williams & Co. for fertilisers. A first-class certificate was awarded to Mr. G. Burden, gardener to George Cockburn, Esq., Lingdale Lodge, Oxtun, for Chrysanthemum *George Cockburn*, a bronze sport from Princess Beatrice. Messrs. Clibran & Sons, Altrincham, exhibited, "not for competition," an extensive display of Chrysanthemums, which included some newer varieties.

[We have been reluctantly compelled to materially abridge the report of this and other evidently fine shows.]

PLYMOUTH.—NOVEMBER 15TH AND 16TH.

THE annual Exhibition of the West of England Chrysanthemum Society was held in St. Andrew's Hall, Plymouth, on the above dates. The cut blooms were the principal feature of the Show.

In the open class for forty-eight blooms, twenty-four incurved and twenty-four Japanese, not less than eighteen varieties of each, there were ten entries. Messrs. W. & G. Drover, Fareham, won easily, the blooms being fresh and bright. The best Japanese were Mrs. C. Wheeler, Vivian Morel, Mrs. E. W. Clarke, J. S. Dibben, Sunflower, W. H. Lincoln, Boule d'Or, and E. Molyneux. Their incurved blooms were in their usual form, the best being Lord Alcester, Golden Empress, John Lambert, Lady Dorothy, Violet Tomlin, Princess of Wales, Alfred Salter, Empress of India (good), and Mrs. S. Coleman. Miss Frupp, The Grove, Teignmouth (gardener, Mr. J. Stiles), was second, who showed well Avalanche, Etoile de Lyon, Mrs. E. W. Clarke, Sunflower being excellent in Japanese section; and the best incurved were Violet Tomlin, Princess of Wales, Jeanne d'Arc, M. A. Haggis, and Empress of India. W. H. Fowler, Esq., Claremont, Taunton (gardener, Mr. G. Hawkins), was third.

For twelve incurved blooms, Messrs. W. & G. Drover were first; Mr.

W. M. Baker, Gloucester, second. In the class for three blooms of Vivand Morel, and three of Florence Davis, Messrs. W. & G. Drover were first, and W. H. Fowler, Esq., second. For three blooms of J. S. Dibben, Messrs. W. & G. Drover were first.

Miscellaneous groups were excellent, W. H. Trickett, Esq., was first with a beautifully arranged exhibit. Chrysanthemum groups were not up to the usual standard.

Fruit and vegetables were very good, but both days the Show was crowded to excess, the hall not being large enough.

BANBURY.—NOVEMBER 16TH.

THE seventh annual Show was acknowledged to be by far the best ever held in Banbury. Not only was the quality of the cut blooms remarkably good throughout, but the competition was also very strong. Unfortunately, the names of the places from which the various exhibits were sent did not appear on the prize cards, so they cannot be given here.

In the principal class for cut blooms, twelve Japanese and a similar number of incurved, all to be distinct, were required. The premier position was well won by Mr. McIntyre, gardener to Viscount Valentia, his stand of incurved containing several grand solid blooms of fine depth. The varieties were—Incurved: Golden Empress, Queen of England, Robert Cannell, Empress of India, Mrs. Shipman, Lord Alcester, Miss M. A. Haggas, Emily Dale, Lady Talford, Mrs. N. Davis, Princess of Wales, and Violet Tomlin. Japanese: W. G. Drover, W. W. Coles, Mdle. Marie Hoste, Mrs. Falconer Jameson, Stanstead White, E. W. Clarke, Avalanche, Ralph Brocklebank, W. H. Neve, Comte de Germiny, George Daniels, and Etoile de Lyon. Mr. Hawkes, gardener to Hon. Mrs. Douglas-Tennant, was a good second, having fine Japanese and fairly good incurved. The third prize went to Mr. Masterson, gardener to the Countess of Camperdown, who had grand Japanese, but was rather weak in incurved.

For eighteen incurved, Mr. Wingrove came in first with undressed blooms of fair quality, Princess of Wales, Queen of England, Lady Hardinge, and Miss M. A. Haggas being the best among them. Second, Mr. Price, gardener to Mrs. Bulley. Third, Mr. W. J. Johnson. For twelve incurved, Mr. Hawkes was first with even solid blooms; Violet Tomlin, Princess of Wales, Lord Wolseley, and Miss M. A. Haggas were particularly good; Mr. H. Dunkin, gardener to the Earl of Warwick, followed closely with an even well-finished stand; Mr. Masterston was third. For six incurved of one variety, Mr. R. Jones, gardener to — Smith-Ryland, Esq., was first with good blooms of Queen of England.

For eighteen Japanese Mr. Wingrove was again a good first with very bright and fresh blooms of good size. His best varieties were Vivand Morel, Stanstead White, Etoile de Lyon, George Atkinson, W. W. Coles, Puritan, Sarah Owen, Sunflower, Mons. Bernard, W. H. Lincoln, and The Daimio. The class for twelve Japanese, distinct, brought out the strongest competition in the Show, eight good stands being staged. The first prize was awarded to Mr. Hawkes, who was somewhat lucky in this instance, as his flowers though large lacked freshness and good colour. The varieties were Stanstead White, Vivand Morel, W. H. Lincoln, Irving Clarke, Mons. Bernard, Boule d'Or, Fimbriatum, Danaë, Mrs. A. Hardy, Val d'Andorre, Avalanche, and Mars. Mr. H. Dunkin, who was placed second, staged a bright fresh stand of large blooms. Etoile de Lyon, Mrs. F. Jameson, and Stanstead White were particularly good. Mr. Masterson was a close third, his blooms also being fresh and bright in colour as well as large. Mrs. Wingrove secured the premier position in the class for twelve blooms, shown as grown. The varieties were similar to those he exhibited in other classes, Vivand Morel being especially good. The same exhibitor was first for twelve reflexed, and also for Pompons, Mr. McIntyre securing a similar position for large flowered Anemones, and for Pompon Anemones.

Mr. Baskett, as usual, was a good first with an excellent group put up in capital style, the flowers being remarkable for their vivid colour and freshness. Mr. Cummings, gardener to Mrs. J. Gillett, was second, and Mr. W. J. Johnson, third. Specimen plants were but poorly shown, Messrs. Wingrove and Bullen being the principal prizetakers.

Apples, Grapes, Potatoes, and Onions were remarkably well shown, the principal prizetakers being Messrs. Doherty (gardener to Lord North), King, Masterson, and Wingrove. Mr. Pope, gardener to the Earl of Carnarvon, secured an easy victory for a collection, and to him was also deservedly awarded a silver medal for the exhibit representing the highest cultural skill.

Mr. Owen of Maidenhead exhibited a large number of new varieties of Chrysanthemums, and was awarded certificates of merit for G. C. Schwabe and Viscountess Hambledon.

YEOVIL.—NOVEMBER 16TH.

THIS Show was held in the Town Hall on the above date, and was a success. Groups of Chrysanthemums and miscellaneous plants arranged for effect are always a strong feature in the Yeovil shows. The first prize in the principal class for a group of Chrysanthemums was won by Mr. A. Crossman, gardener to Jas. Brutton, Esq., Yeovil. Mr. C. Anthony, gardener to Thomas Moore, Esq., Yeovil, was a good second, and Mr. Gear, gardener to B. Penny, Esq., Yeovil, a creditable third. Three groups of miscellaneous plants were arranged. The contest between Mr. Biss, gardener to Jabez Bradford, Esq., Yeovil, and Mr. Appleby, gardener to T. W. Dampier-Bide, Esq., was very keen, and the prizes were awarded in the order in which their names appear. Mr. J.

Allen, gardener to Rev. W. L. Cotter, West Coker, was third. Plants, trained and otherwise, made a fair display. Mr. Crossman was the most successful exhibitor, gaining first prize for three incurved, first for three reflexed, first for three Japanese, first for three Pompons, first for a specimen incurved, and first for a specimen Japanese. Mr. Anthony secured three second prizes, Mr. Appleby one second, and Mr. Sampson, Bridport, one second in the above-mentioned classes with good exhibits.

Cut blooms were shown extensively and in excellent condition. The principal class was for thirty-six blooms of Japanese, not less than twenty-four varieties. There were seven excellent stands staged in competition. Mr. W. Iggulden, gardener to the Earl of Cork, Marston House, Frome, secured the premier position with a grand stand, winning by eleven points. His blooms were very large, solid, fresh, and of fine depth. Among the varieties represented in this fine stand may be mentioned Edwin Molyneux, Etoile de Lyon, E. W. Clarke, Ralph Brocklebank, Boule d'Or, Avalanche, Vivand Morel, Sunflower, Stanstead White, W. W. Coles, Baronne de Prailly, Mdle. Lacroix, and Carew Underwood. Mr. Crossman was a good second. A flower of Vivand Morel in this stand, 8 inches in diameter, and 7 inches in depth, was accorded the N.C.S.'s "certificate of merit" which was given for the best bloom in the Show. Mr. Copp, gardener to W. E. S. Earle Drax, Esq., Holnest, Sherbourne, was a capital third; and Mr. W. Gallop, gardener to H. W. Middleton, Esq., Badford, Porchester, was a very close fourth, all staging excellent blooms. In the class for eighteen incurved, in not less than twelve varieties, Mr. Copp was well to the front, staging, among others, fine blooms of Empress of India, Lord Alcester, Miss Haggas, Jeanne d'Arc, Golden Empress, Lord Wolseley, Alfred Salter, and Queen of England. Mr. T. Sampson was second; and Mr. J. Lloyd, gardener to V. Stuckey, Esq., Langport, third. Mr. T. Wilkins, gardener to Lady Theodore Guest, Inwood, Stalbridge, had the best half dozen blooms of incurved varieties, including an unusually fine specimen of Empress of India. Mr. W. Connelly, gardener to J. R. C. Talbot, Esq., Rhode Hill, Lyme Regis, was a good second, staging smaller and more even blooms. Mr. Iggulden led the way with twelve Japanese, distinct, staging grand blooms of the leading varieties. Mr. Lloyd was a very close second, and Mr. Connelly third. The last named exhibitor and Mr. Lloyd were first and second respectively for six Japanese, distinct, staging fine blooms. Table plants and vases of flowers were well shown.

Three certificates of merit given by the National Chrysanthemum Society for the best group of Chrysanthemums, best cut bloom and best specimen plant (Mdle. Lacroix), were awarded to Mr. Crossman, whose exhibits have greatly tended to make the name of Yeovil well known in the horticultural world. Mr. Banfield of the Sherborne Road, Yeovil, contributed an effectively arranged stand of miscellaneous plants; Messrs. Jarman & Co., Chard, a collection of sixty dishes of Apples; Messrs. Scott, Merriott, a similar number of equally fine Apples; Mr. Stephen Castle, Fordingbridge, Grapes; and Messrs. Robert Veitch and Son, Exeter, staged fifty dishes of Apples in splendid condition. Fruit and vegetables were excellent in the competitive classes.

BRISTOL.—NOVEMBER 16TH and 17TH.

THIS was in every respect a remarkably fine Show. The entries were very numerous, falling only a little short of 500, while the quality generally was decidedly good. The best six specimen plants of large flowered varieties were shown by Mr. J. Ayres, gardener to Mrs. Gibson, Clifton; Mr. J. West being a good second; and Mr. J. Leech, Leigh Woods, third. Mr. Ayres was well first for three specimens of Japanese varieties; Mr. Leech was second, and Mr. West third. Similar positions were occupied by these exhibitors in the class for three incurved varieties, all showing creditably. Mr. T. M. Miller was first for one incurved, and also for one Japanese variety. The best group of Chrysanthemums was shown by Mr. J. Dole, Redlands, Bristol; the second prize being well won by Mr. F. Leigh, Westbury-on-Trym; and the third prize by Mr. J. C. Wall. The principal exhibitors of miscellaneous groups were Mr. W. Bannister, Cote House, Westbury-on-Trym, Mr. J. Crispin, Bristol, and Mr. J. Saunders. There were also classes provided for a variety of other plants, in all of which the competition was good.

The principal class in the cut bloom section was for twenty-four incurved in not less than eighteen varieties. Messrs. W. & G. Drover appeared to have won easily, but not having the stipulated number of varieties were disqualified, letting in Mr. J. Dumble, gardener to Sir Charles Phillips, Haverfordwest, who was placed first; Mr. Runnacles, Sherborne, being second, and the Rev. F. C. Drake, Taunton, third. Mr. Dumble had moderately large good blooms of Golden Empress of India (2), Mons. Bahuant, Emily Dale (2), Alfred Salter, Empress of India (2), John Doughty, Mrs. Robinson King, Prince Alfred (2), Lord Alcester (2), Queen of England, Princess of Teck (2), John Salter, Mrs. Norman Davis, Hero of Stoke Newington, Lady Dorothy, Jeanne d'Arc, and Empress Eugénie. The best eighteen incurved varieties were shown by Mr. Carpenter, Clifton, who had Empress of India, Mons. Bahuant, Lord Alcester, Golden Empress of India, Queen of England, Lord Wolseley, Alfred Salter, Miss Haggas, Princess of Wales, Mrs. Heale, Mrs. S. Coleman, Emily Dale, Barbara, Jeanne d'Arc, Cherub, Lady Hardinge, John Salter, and Princess of Teck, all good. Mr. John Baylis, Winterbourne was second, and Mr. Pethick, third. For twelve incurved Mr. Runnacles was first, Mr. Baylis second, and Mr. Butt, Cheltenham, third.

The Japanese classes were better filled than those for incurved. The first prize for twenty-four varieties went to the Messrs. Drover, who

had fine blooms of Viviani Morel, Puritan, W. H. Lincoln, Violet Rose, Condor, Mrs. Wheeler, Mdle. Hoste, Etoile de Lyon, Lilian Bird, E. W. Clarke, Baron Prailley, Florence Davis, E. Molyneux, Sunflower, Boule d'Or, J. S. Dibbens, M. E. A. Carrière, Sarah Owen, Carew Underwood, Madame J. Laing, Mr. G. Herring, Mont Blanc, and Mons. Bernard. Mr. Dumble was a good second, and Mr. Runnacles third.

In the class for eighteen Japanese varieties Mr. W. Robinson, gardener to Lord Justice Lopes, was first. Mr. Carpenter was second, and Mr. Pethick was third, both having many good blooms. Messrs. Drover were first for twelve Japanese varieties. Mr. Holbrook was second, and the Rev. F. C. Drake third. For twelve blooms of hairy varieties Messrs. Drover were first, Mr. Robinson second, and Mr. W. Wells, Redhill, third; the prize for six blooms of Mrs. Alpheus Hardy also going to Messrs. Drover. They likewise took the silver medal offered for the best Chrysanthemum bloom in the Show, the award being made to a very fine bloom of incurved John Lambert. Fruit and vegetables were particularly good, Messrs. W. Nash, J. Gibson, E. T. Hill, W. Iggulden, and T. Jones being among the prizewinners.

HULL.—NOVEMBER 16TH AND 17TH.

THE annual Exhibition was held as usual in the Artillery Barracks, and was a decided success in every respect. This Society enjoys as high a reputation for its admirable management as it does for the quality of its exhibits. On this occasion there was no change apparent, and everything worked smoothly under the able guidance of Mr. Falconer Jameson as Chairman of the Committee, and Messrs. Harland and Dixon, the Hon. Secretaries.

In the cut bloom classes the entries far out-numbered any previous year, the handsome prizes offered tempting exhibitors from a distance, while the quality of the blooms throughout was of a high standard. The principal class was for twenty-four incurved, not less than eighteen varieties, not more than two blooms of one variety. The first prize being £10 and a silver cup value £5 5s., no less than twelve competed which produced a grand display. Mr. A. Coombes, gardener to the Right Hon. the Earl of Dudley, Himley Hall, Dudley, won rather easily. The varieties were Alfred Salter (2), Golden Empress (2), Queen of England, John Doughty, Golden Queen of England (2), Jeanne d'Arc, Violet Tomlin (2), Miss Haggas (2), Lord Alcester, Hero of Stoke Newington, Princess Teck (2), Jardin des Plantes, Mrs. Coleman, Princess of Wales, Lord Eversley, Mrs. Norman Davis, Mrs. Heale, and Lady Dorothy. Mr. H. Shoesmith, gardener to M. Hodgson, Esq., Shirley Cottage, Croydon, was an excellent second, the blooms smaller, but wonderfully fresh and well staged. Mr. J. Myers, gardener to the Right Hon. Earl of Sandwich, Hinchbrook, Huntingdon, was third, with uneven blooms. Mr. Coombes was again successful in the class for twelve incurved, staging blooms very similar to those in the larger class; and Mr. G. Musk, gardener to Lord de Ramsay, Haverland Hall, Norwich, third. Eight competed.

Japanese made a grand display. No less than ten competed in the principal class, the best coming from Mr. J. Myers, not remarkable for their size, but were deep, bright, and fresh. The varieties were: Stanstead White, Viviani Morel, M. E. A. Carrière, Violet Rose, Mrs. F. Thompson, Etoile de Lyon, George Daniels, Coronet, Madame Bacco, Florence Davis, Mrs. E. W. Clarke, Waban, Lizzie Cartledge, Wm. Lane, Madame C. Audiguer, W. H. Lincoln, Gloire de Rocher, Umpire, Meg Merrilies, M. Bernard, Boule d'Or, Vice-President Audiguer, A. H. Neve, and Triomphe du Châlet. Mr. Musk was a close second with larger blooms, but not so fresh. Mr. Heany, gardener to H. G. Schintz, Esq., Mossley Hill, Liverpool, third, with wider but not so good quality flowers. Mr. Heany won premier award for twelve and also the N.C.S. certificate of merit for a capital stand of blooms, which quite covered the board. Mr. Musk was a good second, and Mr. W. H. Hotham, gardener to W. Robinson King, Esq., North Ferriby, third. Mr. Heany was the most successful amongst nine competitors for twelve white varieties. Mr. Shoesmith was second, and Mr. Hotham third.

In the class devoted to the Anemone section, Japanese or otherwise, Mr. W. B. Davidson, gardener to R. F. Jameson, Esq., East Ella, Hull, secured first honour for twelve, in not less than nine varieties. Mr. G. B. Burrows, gardener to Sir H. Bennett, Westlands, Grimsby, was second, and Mr. G. Wilson, gardener to J. Reckitt, Esq., Swanland Manor, Brough, third. Mr. Myers was the most successful in the class for twelve reflexed, in not less than six sorts, showing well-developed blooms of the best varieties. Mr. W. Welton, gardener to G. A. Carr, Esq., was second, and Mr. B. Davidson third. Six competed. Mr. G. Smith secured leading honours for both Pompon and single varieties. Scented Geraniums were staged by two competitors, Mr. Drury winning, Mr. G. Smith second, neither exhibit possessing much merit.

Prizes were offered for premier blooms in both the incurved and Japanese sections. Mr. Coombes won with Golden Queen of England in the former class and Mr. Musk with Viviani Morel in the latter in the open sections. In the amateurs' division the premier incurved was Mr. Bunn, shown by Mr. J. Melbourne, Albert Avenue, Anlaby Road, Hull, Mr. Bearpark winning a similar honour with Viviani Morel. The silver medal for excellence of culture was awarded to Mr. A. Coombes for his stand of twenty-four incurved, and the certificate of merit of the N.C.S. was given to Mr. Heany for his first prize stand of twelve Japanese blooms.

First-class certificates were awarded to Mr. Molyneux, gardener to W. H. Myers, Esq., M.P., Swanmore Park, Bishop's Waltham, Hants, for Mrs. Mitchell, a buff sport with a purple shade from the incurved variety Empress Eugénie; to Messrs. Cannell & Sons for Lord Brooke; to

Messrs. Pitcher & Manda for The Tribune, a yellow Japanese of much promise, and for Lord Brooke; and to Mr. Newbould, gardener to — Jacobs, Esq., Cragg Road, Rawdon, Leeds, for Mrs. A. Jacobs, a bronze sport from Madame Baco.

Groups of Chrysanthemums interspersed with foliage plants arranged for effect in a space of 100 square feet were a distinct feature. Mr. G. Wilson, gardener to J. Reckitt, Esq., Swanland Manor, Brough, won the silver challenge cup for the third time, and it now becomes his property. This group was effectively arranged, and was a long way ahead of the other four competitors. Mr. G. Coates, gardener to W. Wheatley, Esq., Anlaby Road, Hull, was second; and Mr. Gledhill Cottam, jun., Alma Gardens, Cottingham, third with a pleasing arrangement. Specimen plants receive much encouragement here. For six bush grown, but not formally trained, Mr. W. Goodhill, 32, Stanley Street, Hull, was first; Mr. H. H. Taylor, Newland, Hull, second; Mr. T. Smith, Norwood Nursery, Beverley, third. For three trained specimens Mr. J. Hemming, gardener to E. Leatham, Esq., Beechholme, Newland, Hull, was first; and Mr. R. Thirsk, Grove Hill Road, Beverley, second. Mr. Hemming was first for three standards and for three pyramids, in both classes depending upon the "Rundle" family, which were well represented. For six plants, "cut-back," no less than five competed, making a good display. Mr. Coates won with plants averaging 3 feet high and carrying good blooms. Mr. G. Wilson was second. Table decorations were splendid.

RUGBY.—NOVEMBER 16TH AND 17TH.

THE sixth annual Exhibition was held in the Town Hall on the above dates, and proved to be a great advance on last year's Show, both in the number and quality of the exhibits. In the class for thirty-six cut blooms, eighteen Japanese and eighteen incurved, the competition was very keen. The first prize was awarded to Mr. Coombes, gardener to the Earl of Dudley, Himley Hall, whose flowers were fresh and good. He staged Japanese: Etoile de Lyon, Stanstead White, Alberic Lunden, Japonais, Crystal Queen (very like a pale form of Etoile de Lyon) Mons. Bernard, Puritan, Mrs. F. Jameson, Pelican, Lilian S. Bird, R. Brocklebank, Avalanche, W. W. Coles, W. H. Lincoln, Jeanne Délaux, Mdle. M. Hoste, Madame Baco, and Vice-President Audiguer. Incurved: J. Lambert, A. Salter, Golden Empress, J. Doughty, Queen, Lord Alcester, Jeanne d'Arc, Mrs. Coleman, Empress of India, Miss Haggas, Violet Tomlin, Princess Teck, Mrs. N. Davis, Hero of Stoke, Jardin des Plantes, Princess of Wales, Lord Eversley, and Lady Dorothy. Mr. W. Harman, gardener to the Earl of Denbigh, Newnham Paddox, was second; and Mr. Finch, gardener to Mr. Marriott, of Coventry, third. The other exhibits in this class were so close to the above that they were highly commended by the judges. These were shown by Mr. W. H. Divers and Mr. S. Underwood.

In the open class for twelve Japanese Mr. Harman was first with rather small flowers, and for twelve incurved Mr. Dunkley, gardener to S. Lymington, Esq., of Market Harboro, was a good first. The groups contained some very good flowers, Lilian S. Bird being especially noticeable in the first prize exhibit shown by Mr. H. Blakeway, gardener to P. A. Muntz, Esq., M.P., who also staged a fine bank of Palms and Ferns at one end of the hall.

The local classes for Apples, Primulas, vegetables, and Chrysanthemums (both plants and cut flowers) were well filled and contained some very good specimens. A stall of fruit and flowers was kindly arranged and attended to by Miss Cumming and other ladies, the contents being sold in aid of the Gardeners' Orphan Fund. The whole of the arrangements were exceedingly well carried out by the Committee, the Secretary, Mr. W. Bryant, deserving especial mention for his care and attention.

TAMWORTH.—NOVEMBER 16TH AND 17TH.

THE third annual Exhibition was held in the Assembly Rooms, and was opened by Major Darwin, M.P. (Lichfield Div. of Staffs), who was accompanied by Mrs. Darwin. The Exhibition was a great success, and showed that the interest taken in the cultivation of the "Autumn Queen" in and around Tamworth is rapidly increasing.

There were 220 entries, but the main feature of the Show was that of the various groups and cut blooms in the open class. Of the Chrysanthemum groups that exhibited by the Rev. W. MacGregor, Bole Hall (Mr. Higginson, gardener), was awarded the first prize, and it was acknowledged by competent judges to be exceedingly good, the majority of the blooms being very large. Thesecond prize was awarded to Sir Robert Peel, Drayton Manor (Mr. J. Mack, gardener), for a beautifully arranged group, in which Japanese and incurved blooms were judiciously intermingled. The third and fourth prizes were carried off by W. F. Inge, Esq., Thorpe Hall (Mr. Hurst, gardener), and Mr. T. B. Allkins, Tamworth (Mr. Paxton, gardener), respectively, for very creditable collections. Mr. R. Allum, Bonehill Nurseries (Mr. Tauser, gardener) carried off the palm with an exceptionally pretty and well arranged group of miscellaneous plants, Sydney Fisher, Esq., Camberford Hall (Mr. Salt, gardener), being awarded second honours.

The cut blooms shown by the Earl of Harrington (Mr. Goodacre, gardener), who carried off the first prize last year, were very fine, an Empress of India being especially good; but the premier position this year fell to Sir Robert Peel, who put on the board exceptionally fine blooms. His incurved were very massive, and particularly well finished were those of the "Queen" family. The Japanese were also very good, being large, full, and of good colour. The Earl of Harrington took second prize. The winning board was made up of—Japanese: Etoile de Lyon, Val d'Andorre, Avalanche, Sarah Owen (2), Ralph Brocklebank,

E. Molyneux, Vivian Morel, D. B. Crane, Condor, M. A. H. Neve, Madame Baco, Criterion, W. Trieker, W. H. Lincoln, Eynsford White, Florence Davis, and Lizzie Cartledge. Incurved: J. Lambert (2), Empress of India (2), Mrs. S. Coleman, Lord Alcester (2), Prince Alfred, Lord Wolsley, Queen of England (2), J. Doughty, Golden Empress, Madame Darrier, Madame Gayval, Pink Venus, Mons. R. Bahuant, and Camille Flammarion.

In the class open to gentlemen's gardeners residing within six miles of Tamworth Mr. Mack again showed very good blooms, carrying off first prize for nine Japanese, nine incurved, and twelve various. Mr. Dix, gardener to General Dyott, was second; and Mr. Winchester, gardener to Rev. Hayter Hints, third. Amateurs and cottagers also showed well, and vegetables were admirably staged by gentlemen's gardeners, market gardeners, and cottagers. Messrs. Dwyer and Palmer (Birmingham), and Mr. Cock (horticultural lecturer to the Staffs County Council) kindly superintended the staging of the numerous exhibits.

YORK.—NOVEMBER 16TH, 17TH, AND 18TH.

THE thirteenth Show, under the management of the Ancient Society of Florists, was held on the above dates in the Fine Art Building. Groups of miscellaneous plants and of Chrysanthemums have always been a striking feature at this Show, and on this occasion they were equally good. In the group (80 square feet), arranged for effect, Mrs. Gutch, Holgate, secured the first prize with an extra fine collection of plants carrying magnificent blooms. Many of both the incurved and Japanese would have done good service on the exhibition board. Mr. S. Hardcastle was second and Miss Stewart third. There were five entries in this class. In another class there were again five magnificent groups of Chrysanthemums interspersed with foliage plants (120 square feet), the competition being exceedingly keen. The Lord Mayor's silver cup was the coveted prize in this class, and the premier position was awarded to his Lordship's own gardener. Mr. MacIntosh was second; Dr. Bedford Pierce third; and Mr. J. Sinclair fourth; the City Sheriff (H. Leatham, Esq.), being extra. Dr. Pierce's group was noticeable for its rich colouring, and would have secured a higher position had the centre plant been better proportioned and a trifle fresher in appearance. Mrs. Gutch again secured first prize for four incurveds, and also the same award for four Japanese, Miss Stewart, Dr. Pearce, Mr. T. Smith dividing the prizes in the smaller classes of Chrysanthemum plants. Primulas made an excellent display. Messrs. G. Whitehead, T. Lambert, and G. T. Theakstone winning in the above order. For six dinner table plants Messrs. J. Gould, W. B. Richardson, the City Sheriff, and Sir T. R. Walker secured the prizes as named. A silver medal was also awarded to Mrs. Gutch for cultural excellence in the class for four Japanese Chrysanthemum plants.

Cut flowers, with the exceptions of those in the first prize stands, were scarcely up to average form. Sir R. Walker (gardener, Mr. Folkart) won easily with good examples in the class for thirty-six (eighteen incurved, eighteen Japanese), not less than twenty-four varieties. The following varieties were staged—Incurved: Empress of India (2), Alfred Salter (2), Queen of England (2), Mons. R. Bahuant (2), Golden Empress (2) J. Doughty, Emily Dale, Princess of Wales, Violet Tomlin (2), Miss M. A. Haggas, Princess Beatrice, Jeanne d'Arc. Japanese: Mrs. E. W. Clark (2), Boule d'Or (2), Mdle. Marie Hoste (2), Gloire de Rocher (2), Puritan, Florence Davis (2), Stanstead Surprise, Etoile de Lyon, Ed. Molyneux, Vivian Morel, Sunflower, Avalanche, and W. W. Coles. Mr. H. C. Southwell was second, Mr. T. Smith third, and Mr. Alderman Harding fourth. Mr. Folkart again took premier position for twelve incurveds and for twelve Japanese. In the smaller classes Messrs. Harding, C. H. Simpson, G. Whitehead, and others secured prizes.

Fruit was good. For eight distinct varieties, the Hon. Mrs. Meynell Ingram (gardener, Mr. T. Daws) was placed first. Sir Joseph W. Pease, Bart. (gardener, Mr. McIndoe, was second, and Basil T. Wood, Esq., third. For six bunches of Grapes, three varieties, Lord Hotham was first, Marquis of Zetland second, Hon. Mrs. Meynell Ingram, third, and Sir J. W. Pease fourth. For two bunches of black Grapes Sir J. W. Pease was first, Mr. W. B. Richardson second, and the City Sheriff third. In the white Grapes class Lord Hotham was first, Sir J. W. Pease second, and Mr. W. B. Richardson third.

Mr. McIndoe staged a seedling black Grape which promises to be a valuable acquisition, and was certificated by the judges. The parentage is supposed to be Gros Guillaume crossed with Duke of Buccleuch, bunch of good form; berries very large, and well coloured; skin medium; flavour excellent, dispelling the first impression produced by the size of the berry of its relationship to Gros Colman.

Vegetables were exhibited in large quantities and of the highest quality, well deserving an extended report, which pressure on our space forbids.

NORWICH.—NOVEMBER 17TH.

THE annual Exhibition of this Society was held in St. Andrew's Hall on the date named, and was in every way a success, being a great improvement on preceding Shows. To Norwich belongs the honour of holding the first Chrysanthemum Show in England in 1829, at the "Swan Inn." The Honorary Secretary, Mr. Pollard, deserves every praise for his management.

Cut blooms were staged in large numbers, and generally of good quality. The principal class was for forty-eight, distinct, half to be incurved and the remainder Japanese. Mr. W. G. Gilbert, gardener to B. Le Neve Foster, Esq., Sennowe Hall, Norwich, was an easy first,

having well-developed blooms in both sections of the following. Japanese: Etoile de Lyon, Stanstead White, E. W. Clarke, G. Daniels, Vice-President Audiguier, Pelican, G. C. Schwabe, Vivian Morel, Puritan, Val d'Andorre, Avalanche (good), W. W. Coles, Lilian Bird, E. Molyneux, F. Davis, Boule d'Or, Mrs. F. Jameson, Madame Laing, W. Woodcock, La Vesieux, M. Bernard, D. Bryham, John Dyer, and J. Delaux. Incurved: Golden Empress, Empress of India, Golden Queen of England, Lord Alcester, Alfred Salter, Queen of England, Mrs. R. King, Jeanne d'Arc, Princess of Wales, Violet Tomlin, Mrs. W. Shipman, Ami Hoste, Miss Haggas, R. Cannell, Mrs. S. Coleman, Lady Hardinge, Cherub, Richard Parker, Empress Eugénie, Lord Eversley, Princess Teck, Flora Macdonald, Mrs. N. Davis, and Barbara. Mr. Sheddick, gardener to the Hon. A. F. Fellowes, Honningham Hall, was second with well developed Japanese, incurved lighter. Mr. W. Chettleburgh, gardener to Colonel Rows, Worsted Hall, was third.

Japanese in twenty-four distinct varieties made a good display. Mr. Gilbert was first with heavy fresh blooms. Mr. Atkinson, gardener to E. S. Trafford, Esq., Wrosham Hall, was second; and Mr. Sheddick third. Mr. Gilbert just won the first prize for twelve Japanese, distinct, with medium-sized fresh blooms. Mr. Musk, gardener to Lord de Ramsey, Haverling Hall, Norwich, was a close second. Vivian Morel won for Mr. Atkinson premier position for six Japanese, any one variety; and Mr. W. Bishop, gardener to D. Burrell, Esq., Westley Hall, Norwich, second with Avalanche.

For twenty-four incurved, distinct, Mr. Gilbert was an easy first with medium-sized, well finished blooms, the following being the best:—Jeanne d'Arc, Golden Queen of England, Empress of India, Lord Alcester, and Queen of England (very fine). Mr. Atkinson was second. Mr. Gilbert again won for twelve incurved, and also for six, any one variety; the latter were Queen of England in perfect order. Mr. Sheddick was second in both classes. Reflexed varieties were well shown by Mr. Bishop; Mr. Gilbert second. The latter was successful in the classes for six Anemones, six Japanese Anemones, and for twelve bunches Pompons, distinct. The latter were so good as to be awarded the N.C.S. certificate for cultural merit. Mr. Gilbert also staged the best Anemone Pompons. Single flowered varieties in six bunches were well shown by Mr. Turner, gardener to Dr. T. Browne, Royal Naval Hospital, Yarmouth.

To Mr. Gilbert was also awarded the N.C.S. certificate for merit in the forty-eight bloom class, the silver medal of the Society for premier incurved bloom, Queen of England, and for the premier Japanese, Stanstead White. Mr. G. Woodhouse, gardener to H. Trevor, Esq., Plantation, Norwich, had the best arranged hall vase.

Plants made a fairly good display. For six incurved Mr. W. Bolton, gardener to J. G. Snelling, Esq., Eaton Hall, Norwich, was first, the plants being well clothed with foliage, and carrying good blooms. Mr. Woodhouse was second. Japanese, in six varieties, were very creditable, Mr. Bolton again securing the leading award. Mr. Woodhouse staged the best six Pompons and six reflexed.

Orchids and Primulas were also effective. Messrs. Daniels Brothers made a charming display with Poinsettias, Primulas, Arums, and Chrysanthemums "not for competition." Grapes, Pears, Apples, and vegetables were well represented.

EDINBURGH.—NOVEMBER 17TH, 18TH, AND 19TH.

THE Exhibition of the Scottish Horticultural Society, Edinburgh, was held on the above dates. The vast Waverley Market was again requisitioned as an exhibition building, and, as usual, admirably answered. The chief feature of the Show was, no doubt, the cut blooms, and of these the Japanese were distinctly ahead of the other sections. For forty-eight blooms Japanese, in thirty-six varieties, open to all, the Corporation of Edinburgh, offered a cup value £20, with other money prizes. The struggle for the cup lay betwixt Mr. Parker, Impney Hall, Droitwich, and Mr. Fleming, Hillwood, Corstorphine. The latter exhibitor was plainly handicapped by the late season, several blooms which would have told heavily being still undeveloped. Mr. Parker's, on the other hand, were in excellent condition, and to these the eup was awarded. In this stand there were some really fine blooms of Vivian Morel, Boule d'Or, Stanstead White, W. H. Lincoln, W. F. Jameson, Mr. G. Herring, Etoile de Lyon, Mrs. E. Beckett, Thunberg, Avalanche, Geo. Atkinson, Mohawk, Mrs. M. Wightman, A. Lunden, Sunflower, Sarah Owen, and W. Tricker. The second prize was secured by Mr. Fleming with good blooms. Mr. Beisant, Castle Huntly, Longforgan, was third; Mr. John Malhar Corona, Broughty Ferry, fourth; and Mr. P. Blair, Trentham, fifth. For twenty-four Japanese Mr. W. Rushton, Cochna, Duntrochar, was first with very fine blooms. The following were extra good:—Mr. E. W. Clarke, Bouquet des Dames, Sunflower, Mons. Bernard, W. H. Lincoln, Sunflower, Etoile de Lyon, W. W. Coles, and Vivian Morel. Mr. Ramsay, Gogar Park, Corstorphine, was second with blooms of large size and of fine quality, and Mr. Fleming third.

For thirty-six blooms, eighteen Japanese and eighteen incurved, Mr. Watt, Blackhouse, Skelmorlie, was first, having fine Japs, but very poor unexpanded incurved. Mr. Bell Rossie, Forgandenny, was second. The prize in this instance was a challenge cup and £5, competitors confined to Scotland. No doubt the undeveloped state of the incurved prevented other exhibitors staging. For twelve Japanese and twelve incurved Mr. Parker was first, Japanese rather small but incurved very good. Mr. Blair was second with good incurved. For twelve Japanese Mr. Pirie, Sunderland Hall, Selkirk, was first; Mr. W. Rushton second, and Mr. Watt third.

For twenty-four incurved Mr. Parker took the first place with large

well-modelled blooms, characterised by much freshness. Lord Alcester, John Lambert, Queen of England, Mrs. Heale, Princess of Wales, Mrs. R. King, Violet Tomlin, Miss M. A. Haggas, Jeanne d'Arc, Mrs. Norman Davis were each very fine. The second prize was awarded to Mr. Shoemsmith, Shirley Lodge, Croydon, Surrey, who had blooms not quite so large. For six Japanese and six incurved Mr. Blair was first, and Mr. Watt second; Messrs. Rushton, Watt, and Piric taking the prizes in the order of their names for six Japanese. There were a number of classes for varieties, six blooms of each. The most noteworthy classes were those of Stanstead White, Mr. Beisant being first; Sunflower, Mr. Fleming being first; and Bouquet des Dames, shown by Mr. W. Rushton. Other classes call for no special mention. Some tastefully arranged bouquets, vases, and epergnes were staged.

Pot Chrysanthemums at Edinburgh are never so good as cut blooms. The present year there was no change in this respect. The best shown were doubtless those to which the first and second prize for eight plants were awarded. The premier prize was awarded to Mr. Holmes, Winton Castle, Pencaitland, and the second to Mr. D. Cavanagh, St. Edwards, Murrayfield. The others shown in this class were of inferior quality all through. Mr. Holmes was also first for four plants with dwarfier though smaller specimens than in the last mentioned. Mr. W. Scott, Canaan Lodge, was second. For four plants of incurved varieties Mr. Holmes was once more successful. Pompons were of poor quality.

Three circular groups of Chrysanthemums were staged on the floor of the market. Unfortunately no name or ticket had been attached to these, and owing to the peculiar method of numbering all exhibits instead of employing names it was not possible to find out to whom they belonged.

Miscellaneous exhibits were numerous. Messrs. Pitcher & Manda, Hextable, Kent, sent a large collection of cut Chrysanthemum blooms, chiefly of American origin, including a good incurved named John Eyreman, a deep lilac flower with a distinct silvery gloss, and distinct. Mr. H. J. Jones, Ryecroft Nursery, Lewisham, staged an extra fine exhibit of well grown Chrysanthemum blooms. Among these were good examples of Charles Blick, a most beautiful yellow, rich and glossy in appearance; J. S. Dibbin, softest yellow; Lord Brooke, Mr. W. H. Atkinson, Mr. J. Whittle, a lovely soft rosy blush form; Miss D. Shea, and many others. This collection, numbering many dozens of fine blooms, attracted much attention. Messrs. Pitcher and Manda and H. J. Jones were awarded silver medals for their respective exhibits. Messrs. Methven & Sons staged a splendid group of Chrysanthemums and other plants, and Messrs. Dobbie & Sons, Rothesay, had miscellaneous exhibits.

Fruit and vegetables were very fine, some splendid collections being shown by various well known northern exhibitors. In addition to those mentioned the following awards were made: gold medal to the Stott Fertiliser and Insecticide Distributor Co., Limited, Barton House, Manchester, for the best exhibit of horticultural appliances in the Show. The exhibit consisted of the Stott syringe, distributor, sprayers, &c., combined with the Company's insecticide Kill-m-Right and fertiliser Feed-m-Right; also to Messrs. John Ford & Co., 39, Prince's Street, Edinburgh. Silver medal, Messrs. R. Sankey & Co., Bulwell Potteries, Nottingham, for pottery; and the Government of Nova Scotia, per Mr. George Lawson, for Apples; Mr. A. Jenkinson, 10, Prince's Street, Edinburgh; and Mr. G. M. Crichton, 18, Prince's Street, Edinburgh.

TADCASTER.—NOVEMBER 19TH.

THE Tadcaster Paxton Society held its first Exhibition of Chrysanthemums, flowers, fruit, and vegetables in the Town Hall. The Exhibition was opened by W. Callum, Esq., B.A. Considering the short time the exhibitors had to prepare for the Show, it proved to be a great success. It was largely attended, and did great credit to those who staged in the various classes.

In the class for groups, not to exceed 60 feet, H. Bromet, Esq. (gardener, Mr. Jewitt), carried off first honours with some very fine blooms. The prize (a cup) was given by the Sunlight Soap Co. C. Shann, Esq. (gardener, Mr. Mortimer), was second; and J. H. Ingleby, Esq. (gardener, Mr. Garnett), third. An excellent group was kindly sent by Mrs. Fielden, Grimston Park (Mr. Clayton, gardener), who also sent a fine plant of Margot, "not for competition."

In the cut bloom class H. Bromet, Esq., was again to the front. In the amateur classes several good exhibits were made, comprising Chrysanthemums in pots, sprays, and buttonholes.

A fine display of vegetables was brought together by the cottagers. Mr. Green of Garforth Nurseries sent a splendid collection of Apples, "not for competition." Mr. Padman, The Nurseries, Boston Spa, lent several fine plants to decorate the room.

A special prize was awarded for two good bellglasses full of honey; also to Mr. Hollings for decoration done with Ivy leaves and Chrysanthemums.

BRADFORD-ON-AVON.

AFTER lapsing for five years, this Society was recuscitated, and promises to soon recover its old prestige. The Secretaries are the Rev. W. N. C. Wheeler, M.A., and Dr. Adye, these gentlemen working very hard to make the Show a success. The principal class was that for twenty-four blooms Japanese, in not less than eighteen distinct varieties. Mr. J. Rogers, gardener to Mrs. Hardwick, was well first, having good fresh blooms of Etoile de Lyon, Pelican, Sunflower, Madame C. Audiguier. Eynsford White, W. H. Lincoln, Stanstead Surprise, Avalanche, Sarah Owen, Mrs. Cannell, Stanstead White, J. Delaux, Mons. Bernard, Madame Baco, Gloriosum, and Mrs. Jameson. Mr. G. Tucker, gardener to Major W. C. Clarke, Trowbridge, was a close second. The first prize

for twelve Japanese varieties, distinct, was also won by Mr. Rogers. Mr. G. Frapwell, gardener to W. Gee, Esq., was second. The third prize went to Mr. S. Bishop, gardener to F. Applegate, Esq. The best twelve incurved were shown by Mr. G. Tucker, who had John Lambert, Empress of India, Matthew Russell, Princess of Wales, Mr. Bunn, Queen of England, Mrs. R. King, Lord Alcester, Empress Eugénie, Lord Wolseley, and Jardin des Plantes, all good. The same exhibitor took the first prize for Anemone-flowered varieties.

The best six plants of Japanese varieties were shown by Mr. A. Gibbs, gardener to C. J. Jones, Esq.; Mr. W. Gibbs, gardener to W. E. Taylor, Esq., being second. Similar positions were occupied by these exhibitors in the class for six incurved varieties. The first prize for a bank of Chrysanthemums was won by Mr. S. Bishop, the second prize going to Mr. H. Kiff, gardener to Major F. Clarke, Trowbridge; and the third to Mr. A. Gibbs. Mr. Bishop was also first for a group of miscellaneous plants, the second prize going to Mr. W. J. Stokes, Hilpertown, Trowbridge. Primulas, as shown by Mr. J. Rogers, were very good, Mr. J. Bishop being second. Fruit was well shown.

PUDSEY AND DISTRICT.

SITUATED between Leeds and Bradford, many of the wealthy merchants of these places have chosen their abode in this district, and the townships of Pudsey, Calverley, and Horsforth have established a Chrysanthemum Society, the Show being held at each place in rotation. This year's Exhibition was held in the Mechanics' Institute at Calverley, and proved to be the best of the series. Cut flowers and groups were the prominent features, and the arrangements made reflect great credit on the energetic Secretary, Mr. C. R. Whitam.

For twenty-four cut blooms in eighteen varieties, twelve incurved and twelve Japanese, Mr. J. Leadbetter, gardener to A. Wilson, Esq., Tranby Croft, Hull, won with good flowers. The following varieties were shown:—Incurved: Empress of India (2), John Lambert (2), Lord Alcester (2), Prince Alfred, Golden Empress, John Doughty, Violet Tomlin, Mrs. S. Coleman, and Empress Eugénie. Japanese: Condor (2), W. W. Coles, Viviani Morel (2), Florence Davis, Madame Baco, Mr. J. Laing, Alba Fimbriata, Sarah Owen, M. J. Pigny, W. H. Lincoln. Messrs. H. Clarke & Sons, Rodley, were second; and Mr. A. Barber, gardener to C. J. Omerod, Esq., Brighouse, third.

For twelve dissimilar, six incurved and six Japanese, Mr. T. Newbould, gardener to A. Jacobs, Esq., was first, Mr. Leadbetter second, and Mr. Barber third. Messrs. Newbould, Clark & Sons, H. Wood, and W. Driver, Pudsey, secured the chief prizes in the smaller classes.

Groups of flowering and foliage plants, arranged for effect, were best shown by Mr. W. Butters, gardener to B. Priestley, Esq., M.P. Mr. Newbould was second with a freer arrangement, but wanting colour.

[Mr. S. Bremmell, one of the prizetakers at Birmingham, desires us to say that his initial letter is not "G.," nor his employer's "W.," as inserted in the report on page 442 last week. In the report of the Grimsby Show, on page 423, the names of gardeners and employers appear to have been transposed. The chief winner in the forty-eight bloom class was Mr. W. Welton, gardener to G. A. Carr, Esq., and for twenty-four blooms Mr. J. Walker, gardener to H. G. Southwell, Esq. Mr. F. Isle, gardener to Mrs. Grange, The Cedars, Laceby, was the premier exhibitor in the group class.]

FRUIT FORCING.

Peaches and Nectarines.—Alexander is undoubtedly the best very early Peach for forcing to afford ripe fruit in April. The fruit is large, sometimes 10 inches in circumference, somewhat flat, with a rather deep suture; colour greenish, streaked with red, and deeper red on the sun side, and when well exposed highly coloured; flesh firm, yet melting, juicy, and well flavoured, and clinging more or less to the stone. It bears carriage well, and owing to its brilliant colour takes well in the markets. This variety is very much confused with Waterloo, which, though an excellent very early variety in cool houses and outdoors, is not desirable for very early forcing. Early Louise, too, always sets the fruit well, and for quality surpasses Alexander, and ripens only a few days later. Notwithstanding the difference in time and cost of producing ripe fruit of Alexander as compared with Hale's Early, Stirling Castle, and Royal George, many growers prefer the latter varieties. Hale's Early is unequalled for handsomeness and quality, but it is not nearly so certain a cropper as Stirling Castle when forced very early. The latter variety is not equal in quality to Royal George, but surpasses Alexander in that respect, whilst the tree moreover is hardier than Royal George, and possesses its inherent properties of sure setting, and may be forced to ripen its fruit in April. Nectarines for very early forcing are confined to Advance, and it is a poor thing compared with Elruge. Early Rivers may soon be available, but its flowers are large, and no Peach or Nectarine with large flowers has yet proven satisfactory for very early forcing.

Earliest House.—Although houses planted with Alexander Peach will afford ripe fruit in April when started at the new year, Advance Nectarine coming in a few days later, it is not desirable to drive trees. Such "express" practice is best exercised with potted trees, and this mode of culture is, perhaps, the best for securing a good supply of very early Peaches and Nectarines. Therefore it is preferable to start permanent trees a month or six weeks earlier, say trees not before forced, early in December, the house being closed at the middle of November. Trees that have been forced before will start with astonishing certainty at the customary period, which need not be before the beginning of December. Houses containing Hale's Early, Stirling Castle, and Royal George Peaches, with Elruge Nectarine, should be started at the same time to supply ripe fruit in May. Replace the roof lights and keep the house close, but admit air freely at and above 50°, employing fire heat only to exclude frost during the first fortnight. The more slowly the trees are excited the stronger will be the blossoms. Supply water to inside borders so as to moisten the soil through to the drainage, and if the trees are weakly soak well with liquid manure, but it must not be too strong. Sprinkle the trees in the morning and afternoon of bright days, not, however, keeping them constantly dripping with water.

Succession Houses.—The house and trees should be thoroughly cleaned when the leaves have all fallen. After clearing away the leaves, the house and trees may be well syringed with water at a temperature of 120° to 140°, the former being fatal to most parasites and their eggs or germs. Care, however, must be exercised not to exceed that temperature. The trees should be unfastened from the trellis and pruned. Then paint the woodwork and trellis if necessary, and limewash the walls. Wash the trees with a softsoap solution, 3 ozs. to a gallon of water, using a brush, and taking care not to dislocate the buds. Tie the trees to the trellis, leaving room for the branches to swell. Remove the remains of any mulching and scrape off the loose surface soil, after loosening it with a fork, and supply fresh loam, chopped moderately small, and mixed with about one-fourth of decayed manure. A good handful of the following mixture may be sprinkled on each square yard, steamed bone meal two parts, and sulphate of potash one part. Inside borders must be kept moist and the house as cool as possible.

Late Houses.—Air should be admitted freely, and, where there are hot water pipes, the heat may be turned on in the daytime, with moderate ventilation, turning it off in the afternoon and throwing the house open at night. Laterals and all gross shoots, also surplus growths, should be removed, keeping the trees rather dry at the roots, but not so as to cause the leaves still remaining to become limp. Trees having a tendency to over-luxuriance should have the roots pruned by taking out a trench at a safe distance from the stem and cutting off all the roots, or the latter may be laid bare, and some of the strongest be detached and removed. If the roots are deep it is better to lift the trees, and after shortening the long and strong and bare roots, lay those left in fresh soil nearer the surface.

Lifting and Planting Trees.—Any trees that fail to set or stone their crops satisfactorily may be lifted and root-pruned; but it is best done when the leaves are mature and before they are entirely fallen. It may, however, be carried out with trees that will not be started within a month or six weeks, but if the root-pruning is severe they will be more or less prejudiced in bearing the following year. Fresh trees should be introduced as soon as the leaves are nearly off and can be safely transplanted. Due border preparation should be made for them. Good calcareous loam is most serviceable for planting, and if it extends a little beyond than the spread of the roots it will serve the trees two or three years, and can be added to as the roots extend. Trees for planting in houses are best three or more years trained to walls or trellises in cool structures, as with care in lifting and planting they will afford some fruit the succeeding season. Failing these, two or three years trained trees from nurseries answer well, and being furnished with bearing wood, lifted with an abundance of fibres, carefully planted, and not forced too rapidly, they will afford a moderate crop of fruit the first season. Younger trees take one or two years to become furnished before they are in a fit state for bearing.

Figs.—**Early Forced Trees in Borders.**—These do not force as readily as potted trees, and should not be started before the new year. The trees must now be untied from the trellis and pruned. The extremity growths must be cut back, so as to give place for promising successive shoots, cutting away those fruited to the limit to where the succeeding branches with their young shoots start. Also thin the shoots where too crowded, and remove any elongated spurs, retaining such only as are short-jointed and fruitful. Thoroughly cleanse the house, red spider lurking through the rest season being ready to emerge and to carry on the devastating work. Wash, therefore, the woodwork with scalding water, but keep it from the trees; also scald the walls and wash them with quicklime and a handful of sulphur to a pailful of lime. Wash the trees with softsoapy water, 3 ozs. to a gallon using a brush so as to dislodge scale, and to reach into every angle and crevice, taking care not to injure the young wood. Secure the trees to the trellis after repeating the wash or a dressing of an insecticide, and in tying allow room for the growth of the branches. Fork the surface of the border lightly, remove the loose material, and apply a top-dressing of turfy loam moderately rough, to which a 9-inch potful of crushed half-inch bones and twice as much wood ashes and lime rubbish has been added to every good barrowload of loam—say 3 bushels. Ventilate freely at all times, keeping the house dry and cool, merely excluding frost.

Lifting Unfruitful Trees.—Those casting their fruit untimely or growing too rampantly to produce any, should be lifted and severely

root-pruned and the roots restricted to narrow borders of sound calcareous loam, with sufficient lime rubbish or grit to render them permeable to water. The trees should also have a firm soil to cause the roots to produce numberless fibres, thus giving them a large feeding surface in a small compass, where they can be fed to any extent by surface dressings and liquid applications. The curtailment of the roots must be preceded or directly followed by a judicious pruning of the head, cutting away the gross and useless wood, leaving the best and most promising in the most favourable places for extension. The sooner these matters are attended to after the foliage becomes mature the better.

PLANT HOUSES.

Gladiolus Colvillei The Bride.—This is an excellent plant when six or eight corms are placed in 5-inch pots and grown for flowering in the greenhouse. The corms should be covered with half an inch of soil, and then stood in a cold frame, covering the pots with about 1 inch of ashes or cocoa-nut fibre refuse, allowing them to remain until the plants grow through, when they should be gradually exposed to light and placed in a cool house close to the glass.

Carnation Miss Jolliffe.—Strong layers potted early and given cold frame treatment are producing a central flower stem. The strongest may be placed at once into 5-inch pots and put in a greenhouse where they will flower freely during early spring. If the plants are not needed for this purpose the points may be pinched out, which will cause them to branch freely. It is time that all layered outside for growing under glass were potted, so that they can become established before the winter.

Pelargoniums.—Keep these on shelves close to the glass, where the temperature will not fall below 40°, or rise beyond 45° at night. Abundance of air must be given during the day. Young stock well established in 3-inch pots should be placed into 5-inch. The point of each plant ought to be removed, if this has not already been done. Late cuttings, poorly rooted, may be placed on a shelf where a temperature of 50° to 55° can be maintained until they commence to root and grow, when they must be hardened to cool airy treatment. Old plants cut back late may have the soil shaken from them, and be repotted into smaller pots. Great care is necessary in watering these plants, or else their foliage will damp and become spotted. They should be potted firm and kept on the dry side, but care must be taken to give them sufficient water to prevent their fresh-growing roots perishing.

Petunias.—Young plants in 3-inch pots should be placed on a shelf close to the glass. When they have well filled these with roots they ought to be transferred to 5-inch pots.

Imantophyllums.—These should be kept perfectly cool and on the dry side at their roots, or else the tips of their foliage are very liable to die back. Where seed on any specially good kinds is ripe it should be dried and then sown in a pan or pot, and placed in a temperature of 60°. Seedlings ought to be grown in heat, where they will make much greater progress.

Amaryllis.—Even the latest of these should have completed their growth. If the foliage has practically died away store them under the stage where they can enjoy a lengthened period of rest. Some of the earliest that have been well rested may have the old soil shaken from them, repotted, and placed in the forcing house. The old Johnsoni varieties are useful for this purpose. Care is needed after flowering to prevent the foliage drawing up weakly. They do fairly well on a shelf where heat is maintained to assist them to make their growth.

Araucaria excelsa.—This is a capital room plant; in fact, one of the best that can be grown. Young plants in 5-inch pots should not be confined at their roots if rapid progress is needed. The plants may be placed into 7-inch pots. It is a mistake to overpot them. This plant grows much more rapidly where a little higher temperature than that of an ordinary greenhouse is maintained, but it must not be rushed up quickly in heat.

Chrysanthemums.—As these go out of flower remove any weakly growths, and place the plants in a cool house, where they will soon produce strong sturdy cuttings that are certain to root and do well afterwards. Cuttings of the earliest flowering section may be taken off and rooted whenever they are ready. It is best to strike them under hand-lights in a cool house. Careful feeding should be practised with those that are developing their blooms. Late kinds must not be neglected. Give them abundance of air, and syringe them gently twice on fine days. Ventilate the structure early in the morning where large flowers are expanding, or the work of the season may be destroyed by the flowers damping or becoming spotted.

Lilium Harrisii.—Bulbs should be removed from the ashes under which they were placed to start. Place the plants on a shelf in the greenhouse where slow but sturdy growth will be made. Give water as soon as they are removed from the plunging material, and be careful not to allow them to become dry.

APIARIAN NOTES.

QUEENS.

THE progeny of two queens from a divided hive having access to one common super can return to either hive or compartment, so that when the bees come into contact with the queen,

they, being strangers, are sure to encase her, and if not killed she may be mutilated. Egg-laying will to a great extent be suppressed, and young queens brought forward at the very time eggs are most required for keeping up the strength of the colony.

Queen cells, to be raised for the queen to deposit the egg for a future reigning one, are still believed in by many people. This is a fallacy. Eggs are sometimes laid in an old cell or in a pseudo one, but these eggs are deposited by "fertile workers." A hive in a normal state raises all its queens in virgin cells—i.e., cells formed round the egg intended for a queen, and in no other.

STRONG HIVES.

When honey is to be had the strong hive is the one that will gather most, but if there is no honey to gather, weak hives best preserve what they have. A state of matters like this is not envied by bee-keepers. When a strong hive swarms better results will be obtained if two swarms are united. The way to do this is to thoroughly spray both with a very thin syrup of sugar or honey until the bees are gorged, when they may be put together without the slightest risk of fighting. There is nothing better for putting one swarm to another than the swarm catcher. This process refers to a swarm being joined to another that has been hived some days. Two swarms of the same day may sometimes be successfully joined without any precaution, but this cannot be depended on to be a success. It is, therefore, much better to spray all the swarms before uniting, and where possible to remove one of the queens, and restore her to one of the swarmed hives after destroying all queen cells.

BROOD COMBS.

With the exception of the precaution given at page 450, there is only one other of importance to be attended to. When a strong hive has been strengthened with brood, to prevent it being destroyed the bees ought to be fed liberally for several days, and if the weather is unfavourable artificial pollen ought to be supplied so as to prevent eggs being eaten or young bees drawn. That is a far more common occurrence than many suppose, and bringing forward all the brood or eating out part of it is what constitutes a profitable or non-profitable hive. I have so often described the most suitable hive in these columns that it is superfluous to enlarge upon the subject. The Stewarton hive was admirably adapted for working the progeny of two queens together—that old system which gave such grand results in a country ill-adapted for bee-keeping.

HIVERS.

These are a cumbrance in the apiary, and add considerably to the expense of it. The latest American idea is simply a modification of the old Scottish plan, working two straw hives side by side; and, of a later date, Dr. Dunbar's plan with bar hives, which Messrs. Neighbour nearly forty years ago made a practical success. Of course it had not the queen excluder zinc attached, which is a great hindrance to the free working of the bees.—A LANARKSHIRE BEE-KEEPER.

* All correspondence should be directed either to "THE EDITOR" or to "THE PUBLISHER." Letters addressed to Dr. Hogg or members of the staff often remain unopened unavoidably. We request that no one will write privately to any of our correspondents, as doing so subjects them to unjustifiable trouble and expense.

Correspondents should not mix up on the same sheet questions relating to Gardening and those on Bee subjects, and should never send more than two or three questions at once. All articles intended for insertion should be written on one side of the paper only. We cannot reply to questions through the post, and we do not undertake to return rejected communications.

Wholesale Prices (Queenstown).—What you send is clearly and ostensibly an advertisement, and we respectfully submit that you have no more right to expect us to insert it than anyone has to utilise any portion of your property without paying rent.

Chrysanthemum Mrs. E. W. Clarke (W. T. Smith).—The bloom sent must have been a very good one when fresh; and though it has, as you say, been cut a week, and been two days at a show as the premier Japanese, it is yet $7\frac{1}{2}$ inches in diameter and very full in the centre.

Chrysanthemum Sport (W. A. K.).—If you succeed in establishing the sport from Empress of India you will probably not find the variety very dissimilar to the Queen of England. The bloom sent is young and undeveloped, but suggests a reversion to the original type—the head of the royal family of Queens.

Repotting Climbers (Valley).—The safest time for transferring the plants to larger pots, as you propose, will be in the spring, just when growth is starting. If the plants had been ours we should probably have repotted them a month ago, in order that the roots might have taken possession of the fresh soil before winter.

Soil for Magnolias (Inquirer).—Magnolias succeed in soil of a rather sandy nature, and you will not err if you procure turfy loam and incorporate therewith about a tenth part of wood ashes and the same quantity of crushed mortar rubbish, a little more or less, as the loam may be of a heavy or light texture. Plant firmly, loose and too rich soil promoting succulent growth. Peat may be added to strong soil.

Interpretation of Schedule (Exhibitor).—We do not see anything in the conditions that would exclude either Dracenas or Pandanus from the class. If objection is raised on the ground that they are not "Evergreens" it would be a very technical one and not sustainable. The object was evidently to afford relief to Chrysanthemums and produce a pleasing effect.

Fruit Trees Infested with Lichen and Canker (Anglo-Scot).—When the trees are damp with dew, or after rain, they may be dusted with quicklime, coating them well in every part. This will kill the lichen and moss, and that falling on the ground will have a beneficial effect. Afterwards apply a top-dressing of 5 lbs. of bone meal, 2 lbs. of sulphate of potash, mixed, sprinkled on the surface as far outwards from the stems as the branches extend, at the rate of 4 ozs. per square yard.

Water from Colliery (Aqua).—If the water contains an alkali it will turn red litmus paper dipped in it blue, or if you procure a red litmus solution and pour the supposed alkali water into it it will turn the red litmus solution blue. An excess of alkali is highly injurious to plants, either for watering or syringing, more quickly by the latter than the former process. The best means of neutralising alkalies is by gypsum, but it is hardly available for large quantities of water employed for garden purposes, though it has an excellent effect on soils.

Stimulant for Bulbs in the Open Border (F. J.).—The best stimulant to apply as a top-dressing at this time of year is guano, using 2 ozs. per square yard, sprinkling it on the surface between the plants, and point in very lightly. If you cannot do that, supply the guano in liquid form, 1 oz. to a gallon of water, using 2 or 3 gallons per square yard. The drainings of stables, cow houses, or sewage (not too strong) may be employed with advantage. It is safe to take up and replant bulbs that are just breaking through the surface of the soil, provided they can be lifted with much earth, so as to preserve the roots. If they are much disturbed at the roots the bloom and growth for another year will be much interfered with. The proper time to transplant outdoor bulbs is directly after the foliage has died down. The shorter the time they are kept out of the ground the better.

Forcing Asparagus for Market (Asparagus).—The best way to force Asparagus is to lift the roots carefully, pack them closely in light rich soil, and cover the crowns with 4 inches of light compost. The roots are better placed on a hotbed, but they will produce good heads without, only maintain a suitable temperature. That you name will bring them on slowly, and produce fine heads if the plants are strong. Light is necessary to secure the "grass" being coloured to the extent of an inch at the tip, and the heads should be about 6 inches in length. The heads are put up in bundles of twenty-five, fifty, or 100, according to their size. Sprue or small forced Asparagus is put up in bundles of as many heads as can well be grasped in the hand, and about 6 inches in length. The bundles can be packed in punnets with a piece of coloured paper around them, leaving the tips exposed as evidence of the quality. The bundles being secured, the punnets can be packed in light boxes so as to prevent their moving.

Gypsum as Manure for Vines (F. A. B.).—Gypsum (sulphate of lime) is valuable as a manure for Vines because it contains lime, 32.56 per cent., sulphuric acid 46.51 per cent., and water 20.93 per cent. in its hydrated state. It is especially valuable for soils that are poor in lime and sulphates, and those which have become alkaline or saline, Vines requiring only a modicum of soda. It is a direct and indirect source of Vine food, but is most pronounced in effect in soils that contain fixed potash, which it liberates from certain insoluble compounds of the soil, whilst upon those poor in potash it is more as a fixer than a liberator of plant food that it does good service. It should be ground very fine, and may be used at the rate of a peck per rod for the purpose named—namely, supplying lime and sulphur. But it is chiefly used in special manures. One for Vines is made as follows:—Steamed bonemeal 3 lbs., nitrate of potash 1 lb., sulphate of lime 1 lb.; mix, and apply at the rate of half a pound per square yard, giving the first dressing when the buds of the Vines push, and repeat at intervals of a month or six weeks till the Grapes change colour for ripening.

Peach Trees Infested with Brown Scale (Shropshire).—To effect the destruction of the scale the water used in syringing the trees ought not to be less than 140°, nor exceeding 160°. At that temperature it will destroy all the scale it reaches without injury to the buds or wood, provided the former are dormant and the latter well ripened. Throwing the house open at night to a sharp frost, and syringing the trees with water, has a decidedly beneficial effect in freeing them of scale; but it requires to be repeated to effect a complete riddance. The better plan is to remove the roof-lights, and let them remain off until the buds swell or the time arrives for starting the trees. Under fixed roofs we syringe the trees with water at 140°, and then dress them with a solution of softsoap, 4 ozs. to a gallon of water, adding a small wineglassful of petroleum; and after churning with a force pump until thoroughly emulsified, apply to the trees with a brush, taking care not to dislocate the buds.

Metal Stakes (C. W.).—The effect of small wrought iron stakes in pots upon the soil is not material if they do not remain so long as to become much corroded. The oxide of iron is then more injurious than beneficial, unless it is ammoniated through the plants being fed with ammoniacal manure, such as guano and sulphate of ammonia, in which case the iron aids in the formation of the green colouring matter (chlorophyll) of the leaves and enlarges the growth generally. The galvanised iron stakes are not likely to be materially affected by the acids of the soil. We have not found any appreciable detriment to accrue to plants by the use of either kind of stake mentioned.

Improving Sandy Soil (Anglo-Scot.).—A dressing of lime would improve the sandy peat soil by rendering its vegetable matter more available as plant food, but an excessive quantity would be injurious. About one bushel per rod would be a sufficient quantity to apply, using it fresh. Place the lime in convenient small heaps, covering with a little soil, and when "fallen" spread evenly and fork in lightly, choosing dry weather. If the soil is not very peaty it would be desirable to employ Thomas's phosphate powder instead of the lime at the rate of 10 cwt. per acre or 7 lbs. per rod, as a top-dressing, and leave it for the rains to wash in. The lime should not be mixed with the decayed manure, but apply the former now, and the latter early in spring. As an artificial manure use 3 cwt. superphosphate and 2 cwt. nitrate of soda, mixed, per acre, or 3½ lbs. per rod, and apply it at the time of sowing or planting, or when the crops are appearing above ground.

Extirpating Mealy Bug on Vines (Buggy).—It is not possible to extirpate mealy bug on Vines by one winter dressing, as they take care to find safe quarters before the Vines are pruned, and some are certain to appear soon after the Vines start into growth. We have not found anything better as a winter dressing than syringing the house well in every part with a petroleum mixture, a wineglassful to 4 gallons of water, kept well mixed by one person syringing into the vessel whilst another applies it thoroughly to every part of the structure and Vines. Then, after pruning the Vines, stripping off the rough and loose bark, wash them with a softsoap solution 3 ozs. to a gallon of water. Afterwards apply with a brush a petroleum emulsion 4 ozs. softsoap dissolved in a gallon of boiling water and a wineglassful of petroleum churned violently for several minutes with a force pump or garden engine into the same vessel until thoroughly emulsified. Keep a sharp look out for bug in spring, and if any appear touch each with a very small brush dipped in methylated spirits. Have nothing to do with coal tar, though it is efficacious and not injurious when very carefully used.

Names of Fruits.—Notice.—Special attention is directed to the following decision, the object of which is to discourage the growth of inferior and promote the culture of superior varieties. In consequence of the large number of worthless Apples and Pears sent to this office to be named, it has been decided to name only specimens and varieties of approved merit, and to reject the inferior, which are not worth sending or growing. The names and addresses of senders of fruit to be named must in all cases be enclosed with the specimens, whether letters referring to the fruit are sent by post or not. The names are not necessarily required for publication, initials sufficing for that. Only six specimens can be named at once, and any beyond that number cannot be preserved. (J. D.).—1, Cockle's Pippin; 2, Kerry Pippin; 3, worthless; 4, Fearn's Pippin; 5, worthless; 6, Autumn Bergamot. (J. Milne).—1, Nanney; 2, probably local, and worth grafting on a young stock; 3, Dumelow's Seedling; 4, is not Wellington, and not known; 5, probably local; 6, Waltham Abbey Seedling. (Jarman & Co.).—Waltham Abbey Seedling. N.B.—Fruits that do not arrive before Wednesday can seldom be named in the current issue.

Names of Plants.—We only undertake to name species of plants, not varieties that have originated from seed and termed florists' flowers. Flowering specimens are necessary of flowering plants, and Fern fronds should bear spores. Specimens should arrive in a fresh state in firm boxes. Slightly damp moss, soft green grass or leaves form the best packing, dry wool the worst. Not more than six specimens can be named at once, and the numbers should be visible without untying the ligatures, it being often difficult to separate them when the paper is damp. (Briton).—Vanda cœrulea. (W. A. J.).—1, Polypodium aureum; 2, Adiantum cuneatum cristatum; 3, frond too immature to identify; 4, Pteris longifolius; 5, Adiantum pubescens; 6, Gymnogramma chrysophylla.

PROFITABLE FARMING.

IN continuation of the teaching of our last article on Wheat-sowing, we desire to call attention to each detail of farm management which may reasonably be calculated to afford something towards a profitable result—a fair return upon capital invested in land cultivation. We said in that article that with land rich in fertility, and fine heavy seed, 80 or 90 bushels an acre of Oats may be had. This statement was well within bounds, that quantity being frequently exceeded; but alas! it is much more frequently not approached by 30 or 40 bushels. Surely it must be worth while setting ourselves to meet hard times by improved cultivation of any crop out of which profit is possible. As well cry for the moon as expect a return to the excessively high rates of a day that is past and gone never to return. No, our markets are open to the world, and they will continue open; let us therefore resolve to bow to the inevitable, and make the best of things by leaving off the culture of certain crops, or reducing them to safe limits, and adding others which under good management are known to answer. More than this, let us rise superior to the promptings of petty vanity, and have the good sense to admit that our practice is capable of change for the better. Depend upon it the farmers' advisers—leaders of thought, who tell them that persistence in Wheat-growing anywhere and everywhere is right, that their remedy lies in excessive rent reduction and a duty on imports—are the farmers' enemies, and not their friends.

Never, probably, has there been such a demand for rent reduction as there was this Michaelmas. But how has this been done? Have tenant farmers come forward in a manly way, saying to landlord or agent, "We have earnestly set ourselves to meet our difficulties by changes in the management of our farms, where such changes appeared possible and were calculated to prove profitable?" Have they invited inspection and fair criticism? Notice of intention to leave the farm has been the first step, followed by an intimation of a desire to remain

if the rent is reduced—something like a threat, followed by a plea for reduction. This is not right, and it is no wonder that some landlords lose patience, and say that a tenant who acts in such a manner must go. In two instances during the last twelve months we have done everything possible for the convenience and comfort of the tenants, spending a considerable amount upon repairs, relieving them of responsibility for anything but rent, doing drainage wherever it appeared necessary, erecting new hovels out on pasture for shelter, arranging also to improve poor pasture as it is drained by dressings of mineral manures, yet they have been so ill advised as to act as we say. The notice to leave his farm by one of them was so quickly followed by several applications for it that he asked to re-hire, but he was too late.

We have shown that Wheat-growing should be confined to the land most suitable for it, and that Oats under high cultivation answer where Wheat fails to afford a profit. Let us see what else is possible. Milk, despite all that is said to the contrary, is profitable. Since we published the article containing the statement that this year has been the worst Derbyshire dairy farmers, *i.e.* milk producers for sale, have ever known, we have visited a gentleman in that county who has a large estate and who does all he can for his tenants. He said he had been to Denmark and made close inquiry into dairy farming there, especially into the butter-making, which has proved so profitable that the producers have found it worth while to open shops for the sale of it here. He came back resolved to establish a factory for his tenants, but upon going closely into the matter he found they were doing better with the sale of milk than was possible if the butter factory was set going. Though his decision may not have been quite reliable, it tends at any rate to show that milk-selling is not so bad a business as it is said to be.

So much depends upon the individual. We have a tenant on an estate where Stilton cheese making is the staple—and a highly profitable industry—who makes no cheese, simply because his wife makes such good butter that the whole of it is sold to private customers at a high price. Another tenant sends his milk to London or Leicester after the cheese season ends, that is from the end of October till the end of March, because he finds it answer best to do so rather than turn to making inferior butter, as most of his co-tenants do during winter. But he takes care to have several heifers calving during winter, both to keep up the supply of milk and to sustain its quality. In other words he is an able man who is not content to follow mere custom, but thinks and acts for himself, and adapts his practice to local circumstances and market requirements. He and his family all work hard, they are prosperous and will continue so, simply because in them industry and thrift are united to intelligence and business capacity.

WORK ON THE HOME FARM.

Winter corn sown early is looking remarkably well, both Wheat and winter Oats being very strong, and Rye is so forward and vigorous that even now it would be useful for grazing if required. But herbage is poor in quality now, and those who make cheese and butter from cows out on pasture in November know to their cost how very much more milk is required to make a given quantity of either in comparison to results in spring and summer. It was with much regret that we saw many fine beasts out on pasture during the past week. They had been summered so well that they were almost ready for the butcher, but there they were out on the pasture without any protection from cold or wet, and were bound to fall off in condition. The farmer said he was holding them over till the glut of beasts on market was at an end. So far he was wise, but the beasts should have been in a yard a month ago, where they could be quiet, warm, and dry, as then the food consumed would have sent them to market in such high condition and is impossible now. Though on good pasture, with cake pans, they were running about in a restless, unsatisfactory manner, and must lose flesh for every good reason.

How heavy the annual loss is from the exposure of cattle in winter! We were driving in the High Peak district of Derbyshire just at day-break on November the 18th. The roads were hard with frost, and hoar frost covered the pastures. Among the walled enclosures groups of cattle were lying out in the open, not a hovel of any sort being visible.

There many of them remain all the winter, and the loss is caused by their low condition in the spring. It is simple nonsense to say the hardy animals can bear it; that is not the point. It is a question of profit and loss, easily solved, and stupidly ignored or misunderstood. To landlords we say, Help your tenants by providing means of shelter; the cattle will go readily enough into any open hovel where they can obtain protection from wind and rain.

Take every possible precaution with cows or heifers due to calve during the winter months, keeping them quiet and well cared for in every way. As the calving time approaches for each one withdraw it from the herd, placing it in a lodge opening into a small yard. The lodge should be sufficiently commodious for the calving, and ought to be closed then, also on very cold nights before the calving, and entirely afterwards.

WEBB & SONS' ROOT CROP COMPETITION, 1892.

THE Judges (Mr. Joseph Beach, The Hattons, Wolverhampton, and Mr. W. H. Hill, Claverley, Bridgnorth) appointed to award the valuable prizes offered by Messrs. Webb & Sons, of the Royal Seed Establishment, Wordsley, Stourbridge, for the best root crops grown from their seeds and with the aid of their special manures, have made the following awards:—

District 1.—Five Acres of Webbs' Swede, open to the counties of Salop, Stafford, Montgomery, Warwick, and Leicester, first prize, £15 15s., Mr. G. H. Simcock, New Farm, Woodhouses, Whitchurch, 38 tons per acre; second prize, £10 10s., A. Wynne Corrie, Esq., Park Hall Farm, Oswestry, 37 tons 8 cwt. per acre; third prize, £5 5s., Mr. W. Nunnerley, Kenwick, Ellesmere, 33 tons 17 cwt. per acre.

Three acres of Webbs' Mangold:—Prize £5 5s., A. Wynne Corrie, Esq., Park Hall Farm, Oswestry, 41 tons 15 cwt. per acre.

District 2.—5 acres of Webbs' Swede, open to the counties of Hereford, Monmouth, Brecon, Glamorgan, Radnor, and Pembroke. First prize, £15 15s., the Marquis of Bute, Blackweir Farm, Cardiff, 40 tons 10 cwt. per acre; second prize, £5 5s., Mr. J. Thomas, Tile House, Beverton, Cowbridge, 37 tons 16 cwt. per acre.

3 acres of Webbs' Mangold.—Prize £5 5s., Mr. J. H. Harding, Monachty Farm, Maindy, Cardiff, 54 tons 15 cwt. per acre.

District 3.—5 acres of Webbs' Swede, open to the counties of Oxon, Bucks, Berks, Wilts, Hants, Surrey, Worcester, and Gloucester. First prize, £15 15s., Mr. E. F. Bellamy, The Moat, Newent, 33 tons 14 cwt. per acre; second prize, £5 5s., Mr. F. Cole, Dodford Farm, Christian Malford, Chippenham, 30 tons 6 cwt. per acre.

3 acres of Webbs' Mangold.—Prize £5 5s., Mr. E. F. Bellamy, The Moat, Newent, 37 tons 18 cwt. per acre.

District 4.—5 acres of Webbs' Swede, open to the counties of Bedford, Cambridge, Cornwall, Cumberland, Cheshire, Derby, Devon, Dorset, Durham, Essex, Hertford, Huntingdon, Kent, Lancaster, Lincoln, Middlesex, Norfolk, Nottingham, Northampton, Northumberland, Rutland, Somerset, Suffolk, Sussex, Westmoreland, York, Carmarthen, Carnarvon, Cardigan, Denbigh, Flint, and Merioneth. First prize, £15 15s., Mr. H. Hocknell, Heywood Farm, Audlem, 47 tons 12 cwt. per acre; second prize, £5 5s., Mr. Alfred Hocknell, Newtown, Audlem, 45 tons 4 cwt. per acre.

District 5.—3 acres of Webbs' Mangold, open to the county of Lincoln. Prize, £5 5s., Mr. R. Smith, High Bank, Spalding, 37 tons 12 cwt. per acre.

REMARKS.

13th.—Fair throughout, and generally sunny from 11 A.M. to 1 P.M., and at times in afternoon; showery after 9 P.M.

14th.—Bright sunshine from 9.30 A.M.; fine evening, slight shower at 10.30 P.M.

15th.—Almost incessant drizzle till 2 P.M., then fair till 6.30 P.M., and heavy rain in evening and night.

16th.—Almost incessant rain from midnight to midnight.

17th.—Fine and dry, with gleams of sunshine at midday.

18th.—Fair early; sun visible through smoke cloud at midday; foggy about sunset.

19th.—Generally cloudy, and at times foggy; but occasional sunshine.

The week was noticeable for the warmth and sun heat on the 14th, and for the heavy rain of the 15th and 16th; night minima generally high.—G. J. SYMONS.

NO fruits grown in gardens are more difficult to keep from birds, wasps, and bluebottle flies than are sweet ripe Cherries. Pyramid Cherry trees in gardens often cost as much in keeping birds at bay as the fruit is worth. Fruit cages—that is, a plantation of Cherries enclosed in wire netting—exclude birds; but ripe Cherries exposed to the weather crack in proportion to the amount of the sugar they contain, spoiling just the same as Grapes do in a moist stagnant atmosphere, or as Mulberries soon rot on the ground from their undergoing the vinous, so called, but really sugary fermentation. Trees growing against walls can be managed better, but even there an unfavourable beating of rain on those not protected by leaves causes the fruit to burst. Therefore, we have had the conclusion forced upon us that to fully enjoy the best dessert Cherries for any length of time they must be grown under glass. No expensive house is needed to have a supply of Cherries from the end of May until the autumn, but the structure must be light, well ventilated both at the top and bottom, and occupy a dry and sunny position. They can be grown without any artificial heat, and so as to afford a long supply of delicious fruit, for no fruit hangs better than Cherries if they are kept dry.

The trees may be grown in pots or planted out, bushes, pyramids, or standards answering well in appropriate positions. When the trees are in pots they can be placed outdoors after the fruit has been gathered, the wood is sufficiently firm and the buds well formed, but not over-developed. If the trees are planted in the borders, the roof lights ought to be moveable, as the rain and dew refresh and invigorate the trees, whilst the soil is moistened through to the drainage. Cherries under glass demand as sweet an atmosphere as they enjoy outdoors. To stew the trees like Vines in the early stages of their growth is certain to bring off all the blossoms or young fruit, hence the importance of providing plenty of air.

A dozen good Cherries for growing under glass are Early Rivers, Early Red Guigne, Bigarreau Jaboulay, Empress Eugénie, Bigarreau de Schrecken, May Duke, Black Tartarian, Governor Wood, Elton, Bigarreau Noir de Gueben, Tradescant's Heart (large black Bigarreau), and Emperor Francis. A select six varieties are Early Rivers, Empress Eugénie, Black Tartarian, Governor Wood, Bigarreau Noir de Gueben, and Emperor Francis. Three of the very best—Early Rivers, Governor Wood, and Tradescant's Heart (large black Bigarreau). The chief desiderata in cultivating Cherries in a cheap cold house are to admit air freely, keep the trees free of aphides and red spider, syringe freely after the fruit is set until it commences to ripen, supply water and nourishment to the roots, and exclude birds by some netting placed over the ventilators.

When the trees are to be planted in borders and trained to a trellis fixed about 12 inches from the glass, a lean-to house facing south, and about 12 feet wide, is best, or a three-quarter span-roof similarly situated. A span-roof is not good for early work, though it answers quite well where the fruit is required to be kept; but for the latter purpose nothing equals trees in pots, removed when the fruit is ripe to a north house. In the lean-to the front trellis, if the trees are grown on the back wall, must only extend two-thirds up the roof, the trellis curving so as to admit light to those on the

back wall. The border should be wholly inside, and not made all at once. A border about 9 to 12 inches wider than the roots extend when spread out, or 4 to 6 feet wide according to the size of the trees, is sufficient to commence with. It should be drained 1 foot deep with broken bricks or rubble, roughest at the bottom and finest on the top; 3 inches thickness of old mortar rubbish, with the finer particles sifted out, and pieces of lath removed, answers perfectly in preventing the soil mixing with the drainage. There must be a drain below all to carry off superfluous water.

Cherry trees thrive naturally in deep calcareous or silicious soil. It is difficult to tell whether the calcic or the silicic elements are most important as factors to the health and fruitfulness of the Cherry tree. The deep loam of Kent, where Cherries thrive, is simply an admixture of calcareous sandstone (Kentish rag) with rain-wash or brick-earth, now a deep loam. In West Hertfordshire and Buckingham the loams that give the Cherry trees their power to produce enormous crops are filled with calcareous and silicious gravels over chalk or silicious strata, and they never suffer from drought because the chalk gives out its moisture in dry periods. The soft sandy soils of Surrey and Middlesex, the dry and high Epping plain, and the Woburn sands of Beds, all let down the Cherry tree roots so that they draw moisture and lime, and iron from beneath the arid surface. Chalk soils, as a rule, eat up the May Duke race, and in too rich alluvial soils Cherry trees gum to death. Every county almost from Land's End to John O'Groat's contains the argillaceous soil which enables Cherries and other fruits to be grown successfully by competent men.

From 24 to 27 inches depth of soil is ample for a Cherry border. Good turfy yellow loam from an upland pasture, cut 3 inches thick and chopped up roughly, yet so as to lie compactly, answers very well without any admixture whatever, provided it contain stones or fragments of rock, which, when exposed to the weather, crumble into chalk and flints. If purely argillaceous, but not very clayey, as the top soil seldom is, take four parts of the loam and add to it one part (a fifth) of mortar rubbish from an old building, avoiding that from papered walls, and one part (a sixth) of sharp road scrapings, thoroughly incorporating. The border being firm and a few inches higher than the intended level to allow for settling, plant as soon as the leaves show indications of falling, spreading the roots carefully, firming the soil well about them, and give a good watering. The lights being moveable, as they ought to be where forcing is practised, take them off and mulch the surface with a little short spent stable litter. Trees that have been trained to walls three or four years and moved annually, so as to move safely, are the most suitable, as they will be in a fruitful state and calculated to afford some fruit the first season. Three of the best varieties for forcing are Early Rivers, Black Tartarian, and Governor Wood. If a "light" Cherry is wanted to form a companion dish to Early Rivers, Early Red Guigne or Belle d'Orleans may be selected; and if there is a desire for the May Duke flavour Empress Eugénie supplies it soon after Early Rivers. For following on, but preferably in another house, Bigarreau Noir de Gueben and Elton will satisfy every requirement; and for a late supply Tradescant's Heart or Large Black Bigarreau, and Emperor Francis are approved by three large growers of Cherries under glass.

Cherries are readily forced in pots, but a simple and excellent way to grow them is as single cordons, trained to a trellis 9 inches from the glass in a lean-to wall case, 6 feet wide and facing south, planting the Duke race 18 inches and the Heart and Bigarreau 2 feet apart. Top lights, 2 feet wide, should open half their width, also the front roof lights; but these must be moveable. The trees may be planted in the front, and the back wall clothed with Tea Roses. Two rows of 3-inch hot-water pipes, fixed 2 feet from the front, will furnish sufficient heat for ripening Cherries in April and May.

Trees should now be procured. If in pots, give them a larger size if they require it, disentangling the roots at the sides with a tine of an old fork, clear away the drainage and loose surface soil, and cut back any straggling or thick roots. Provide good drainage, use some rough compost over it, and ram the new soil as firmly as the old. Trees in pots as large as desired need only have the drainage rectified and be surface dressed, or the old drainage may be removed—cut clean off a few inches from the base, placing in fresh drainage and soil so that the base rests hard upon it, removing the loose surface soil and supplying rich material. For potting add a fourth of decayed manure to the loam, that is, 3 bushels of loam, 1 bushel of decayed manure, a 10-inch potful of half-inch bones crushed, and a similar quantity of charcoal about as large as a Filbert, a quart of Thomas's phosphate powder, and 2 quarts of wood ashes, mixing all well together. If the trees are not in pots the best shaped and cleanest growing pyramids or bushes should be lifted. Large trees can be treated in that way if they have been prepared by annual lifting, and they will fruit at once; but, as a rule, sturdy young trees with clear bark and well furnished with branches are the best, such as may after trimming in the roots a little, be placed in 10-inch pots. Allow them to grow a year and become well established before forcing them. Stand the pots on a base impervious to worms, yet such as will allow the water to pass away freely, the situation being sunny, surrounding the pots with ashes to the rim, and place some protective material over them in severe weather. Afford a good watering after potting or interfering with the roots of trees. None of the trees need be placed under glass before the time arrives for starting them, as they never suffer from frost unless the wood is sappy and unripe, and such trees are best burned, for gum is sure to claim them, and gummed trees are worse than none.—G. A.

HARDY FLOWER NOTES.

CROCUSES IN NOVEMBER.

THERE is something pathetic in the fate of some of the hardy flowers which in November seek to light up our borders and rockeries. This dull month is truly, as the poet says, "that sad season,"

"When woolly mists the chillier landscape wrap,
And beggared Autumn, with a silent tear,
Empties her gold leaves into Winter's lap."

And in this November of 1892 some flowers which should have bloomed earlier have lingered long, and now seem to mourn the cold and cheerless season. Here (in Kirkcudbrightshire) at least everything is later than has been the case for many years, with some curious exceptions.

Claiming our attention first of all are the Crocuses. Few people can realise that our gardens might in the dull seasons of the year be made brighter by the possession of some of these autumn species, now becoming more numerous as a demand has arisen for them. We cannot expect to have them as plentiful as the spring flowering species, nor can we expect them to glow with the brightness of these. Our autumns are all too dull and sunless for this. These flowers open delightfully to the sun, and they close quickly when the cheering rays are withdrawn or clouded over. They are too short a time with us now, and the glory of the flower is hardly revealed to us ere it closes again, and in lieu of the expanded cup presents a cone or cylinder of colour. And yet there is a compensation for the short period of fullest beauty in each day, for if protected from the furious winds and the falling rain, the Crocus will last longer in cloudy weather than when the sun has fuller and longer power.

First in the procession of autumn Crocuses (for the plural Croci, although grammatically correct, will not hold its own in popular phraseology) comes the bright and beautiful *C. speciosus*, which has never pleased me so well as this season, as it has been in flower for such a length of time. A good many of my corms are seedlings from a packet of purchased seed, and whether these have varied in time of flowering, as seedlings may do, or whether it has been the season, I cannot tell, but I have had a constant succession of flowers for a much longer time than usual. Few there are to equal, and, I think, none to surpass, this "blue" Crocus, with its

exquisitely veined and feathered blue-purple flowers and fine rich orange-coloured stigmas. I do not think Bieberstein, to whom the specific name is due, has been happy in his choice. *Speciosus* or "showy" seems rather inappropriate to such a delicately beautiful flower, although as a term of comparison with the other autumn flowering species it is quite applicable. Dean Herbert described three varieties and the "Cottage Gardeners' Dictionary" named four—viz., the type *C. s. caucasicus*, *C. s. laxior*, and *C. s. transylvanicus*. I have some bulbs under the latter name, and it seems of a dwarfer and more free-flowering habit and to produce flowers of rather better form. I bought this as having a darker flower than the typical species, but can see little difference. I have never managed to seed any of the autumnal Crocuses, so have been unable to see what variation there might be; but there is some slight difference of habit among the seedlings from purchased seed. *C. speciosus* is a native of the Caucasus and Transylvania and of the east of Europe. The date of its introduction does not appear in the ordinary books of reference. Figures and descriptions of three varieties are given in the "Botanical Magazine," vol. lxvii., and a good illustration of the type is given in Wooster's "Alpine Plants," first series, plate 25.

Less beautiful, but withal very pretty too, is *C. nudiflorus*, with its reddish purple flowers and deeply cut orange coloured stigmas. The leaves are not produced until spring, and are slender, appearing very early in the season. The Naked-flowered Crocus, as this species is commonly called, is a native of south-west Europe, but has been naturalised in various localities of central England. It is said to be particularly plentiful around Nottingham. Very pretty at present is *C. Clusi*, Clusius' Crocus, which does not seem to be common. It is very beautiful, with its good sized bright purple flowers becoming almost black towards the base. Like several others it flowers without the leaves, which are just beginning to appear. This species is a native of Portugal, and was introduced in 1835. It is also found under the name of *Clusianus*, which is probably more correct than the name under which I have it. Another species at present in flower is *C. longiflorus*, known also as *odorus*, which has pretty soft rose-lilac flowers, and was introduced from Naples in 1830. There is another *C. longiflorus*, flowering in spring. A pretty species with purple-lilac flowers, which is just coming into flower, is *C. asturicus*. This is a native of Asturia, and was introduced in 1842. One of my especial favourites is *C. zonatus*, which I always consider one of the most beautiful of all, with its pretty rose-lilac flowers, each having a charming orange coloured zone at the base. This is one which should be secured and increased as much as possible. No record of this Crocus appears in Paxton's "Botanical Dictionary," the "Cottage Gardeners' Dictionary," nor Nicholson's "Dictionary of Gardening," and I regret that I am not so fortunate as to possess Mr. Maw's Monograph.

I have several other lilac or purple autumn flowering species; but these by no means exhaust the list of those in my garden, and the length of my notes remind me that I have left but little space for some of the most charming and least plentiful of all. There are some beautiful white or whitish coloured species now in flower or coming into bloom which would require the pen of a Ruskin or a Jefferies to do justice to their chaste and delicate beauty. These tiny cups, in most cases surrounded by a fringe of narrow leaves, well reward a little care to prevent them being despoiled by the season's inclemency. Among the most charming of all of these is *C. Boryi* or *Boryanus* of Gay, and which has a popular name too long for such a pretty plant—*M. Bory de St. Vincent's Crocus*. This is a little gem, growing from 3 to 4 inches in height, with creamy white flowers with a yellow throat, and the base of the segments marked on the outside with purple lines, the leaves being produced shortly before the flowers. The anthers are white and the stigmas orange scarlet. It is figured in the "Botanical Register" for 1847, and also in Wooster's "Alpine Plants." The illustration in the latter shows much brighter purple on the outer segments than in any I have seen, and this purple marking is also carried further up the flower. The illustration also fails to show the milk-white anthers. *C. Boryanus* is a native of the Morea and the Greek Islands, and was introduced about 1844. Very beautiful is the almost pure white *C. hadriaticus*, which is, with me, rather later than *C. Boryanus*, and has not yet fully opened. It seems a little more tender than some of the other autumn species. Its native habitat is indicated by the specific name. The leaves of *C. hadriaticus* appear shortly before the flowers.

A very pretty species which I have lost, but must replace at the first opportunity, is *C. ochroleucus*, with creamy-white flowers with an orange coloured base. It is a native of the Anti-libanus and was introduced in 1862. *C. cancellatus* is just coming into flower here also, and is a very desirable little Crocus with fine white flowers with a purple base. One of the finest of the white or whitish species is, however, *C. hyemalis*, which is now in flower

here from established bulbs. It is larger than the other white species here and has longer flowers of good substance and colour. The outer segments are prettily streaked with deep purple, and the beauty of the flower when open is greatly enhanced by its black anthers, and the fine wire-like, deep coloured stigmas. The leaves appear before the flowers. I regret that I have no record of this species, and it is unfortunate that we seem to have no full synopsis of the genus with the exception of Mr. Maw's Monograph, which is so expensive as to place it beyond the reach of the majority.

Several other species and varieties of various colours would claim notice, but I must conclude with an allusion to the yellow autumn-flowering species. A good hardy yellow autumn Crocus is much to be desired, as it would be a welcome contrast to the other varieties and to the Colchicums, which have the drawback of being deficient in range of colouring. We have, it is true, the yellow *C. Scharojani*, introduced from the Caucasus in 1869. I have this Crocus, which is only in bud at present. Besides its first cost, which is still rather considerable, it is to be feared that it is an unsatisfactory grower and flowerer. This is the general report, and I cannot controvert it, as I have had mine too short a time to venture an opinion of my own. I observe, however, that Herr Max Leichtlin of Baden-Baden has a new yellow autumn Crocus, which he says is a much better one than *C. Scharojani*. If so, it will be worth its weight in gold, not only metaphorically but literally, for these new Croci, such as *C. Aitchisoni*, are introduced at high prices as the supply is at first limited.

I have before now called attention to these autumn Crocuses, and do so again, feeling assured that they are of the utmost value in the hardy flower garden. They have a greater range of colour, are more refined in their appearance, and are more attractive than the Colchicums or Meadow Saffrons, and should find a place in every rockery or border of hardy flowers. Given a place and sheltered from storms of wind and rain by handlights or cloches they will give much real pleasure to the growers.—S. ARNOTT.

NOTES FROM WORCESTERSHIRE.

FRUIT DRYING.

I AM always pleased to read anything in reference to fruit preservation in the *Journal of Horticulture*, and hope it will be kept to the front, as it is sure to be a great feature before many years have passed. I suggested it as a subject for the technical education grant, but it has not been carried out. Great loss is sustained by not having a proper market in country places to dispose of surplus fruit. It is hard to see fine fruit, even Green Gage Plums from wall trees, rotting for want of a near market. It is over thirty years since I saw the dried Apples being sold in Canada at most grocers' shops, so that we are altogether behind America in taking up this evaporating process, which must come to the front ere long.

THE WINTER MOTH.

These made their first appearance with me on October 30th, the males a few nights before the females. They may now be seen in pairs on the trunks of trees by the aid of a lantern. There is a point in their life history that I have hitherto been unable to prove to my satisfaction—viz., their flying in pairs, and thus escaping the grease bands. For three or four seasons I have watched for this generally accepted idea, and although I have tried my utmost I cannot prove it by noticing thousands of pairs at rest. On being disturbed at this stage they invariably fall to the ground; but in no case does a male fall if alone, provided the wings are properly developed, which is not always the case.

I have also examined, as far as sight is capable, thousands of males on the wing in the dusk, and after dark, without being able to find a female being carried in flight. I am not prejudiced against the idea, but cannot prove it. There appears to be a slight increase of moths compared with last winter.

BULLFINCHES.

It would be interesting, if it could be ascertained on reliable authority, to know whether we get a quantity of these birds some seasons by migration from the Continent. Last year was an exceptionally scarce year, and no damage worth mention was done to my fruit buds in spring. This autumn there appears to be an unusual number come from somewhere. Last week about a dozen were taken in trap cages in my garden. A gentleman well known throughout Worcestershire writes me:—"We have suffered much from bullfinches here, and are likely to suffer more if we do not take action, for they are very plentiful this year."

For the next six weeks these birds are as easily caught as robins.

I have so often, in the *Journal*, advocated catching, instead of shooting the birds and damaging fruit trees, that it is scarcely worth repeating and giving instructions; but there are always some fresh readers, which must be my excuse for referring to this matter this season.—J. HAM.

A NEW SILVER-LEAVED ELDER.

VARIEGATED foliaged shrubs form a striking feature in pleasure grounds when judiciously planted, but to insure the best results discretion must be brought to bear upon their use. Still, they afford relief to the sombre appearance of evergreens during the summer months, and none more so than the golden and silver-leaved Elders. Among the latter that shown in the accompanying illustration (fig. 63) will perhaps take a leading place. This was exhibited at a meeting of

FIG. 63.—A NEW SILVER-LEAVED ELDER.

the Royal Horticultural Society on September 20th of this year by Mr. E. Gibbs, gardener to Miss Alice de Rothschild, Eythrope, Aylesbury, and was accorded an award of merit. The leaves are comparatively small, those matured spotted with green, the young foliage being almost white. It is said to be a sport, and judging from the shoots shown at the meeting alluded to a well grown bush would form a pleasing contrast to dark-leaved or evergreen shrubs.

TOMATOES AND MUSHROOMS.

WE have close on 40,000 square feet of glass devoted to Tomatoes, and by adopting the advice frequently given in the *Journal*—viz., giving fresh air with a dry warm atmosphere, we have no disease worth mentioning, and not a single white fly is to be seen. We have had particularly good crops from soil that has previously grown two and three crops of Tomatoes. Our soil, though rather poor and shallow, is of good quality. Too many still attempt to grow Tomatoes in rich and loose soil, digging in quantities of farmyard manure. This we never do, and we use it only as a mulch on the border. We fork in, and give several times throughout

the season, good dressings of Thomson's manure. By this treatment we get strong leathery leaves that withstand disease, and if the spot does attack the foliage it does no injury to the fruit. Last year we had one house, 150 feet long, planted with Ham Green Favourite. Owing to faulty ventilation, and a few excessively hot days in June, the spot started on the leaves, and rapidly spread until every leaf was affected. We used no dressing of any kind, but paid strict attention to airing and watering. Though the leaves were spotted very badly to the last, it was the best house we had, gave nearly 1½ ton, cropped for six months, and fruit all sound. The varieties we like best are Eclipse, a new kind sent by Austin & McAslan, Glasgow, a few years ago; Sutton's Perfection, Ham Green, and Conference. It is difficult to say which is best, as when well grown all are heavy croppers and smooth skinned. We have one plant which has borne an enormous crop of fine fruit. It was planted for Conference, but is so distinct that we think it must be a sport or self-crossed kind. A piece of stem cut off the top of the plant 18 inches in length carried fifteen finely shaped fruits weighing 3 lbs. The plant was 6 feet high, and was bearing for four months. As for quality, we have only to mention that they bring 11d. per lb. in market, and have never throughout the past season realised less than 6d.

MUSHROOMS.

I intended writing you before now to tell you of the wonderful Mushrooms we have been gathering since August from a small border planted with Tomatoes, and strange though it may seem, we attribute the size and quality of the Mushrooms to the liberal use of the manure above mentioned. We were led to use this fertiliser as an agent in Mushroom growing by a letter we received some years ago from Mr. Murray, the able gardener at Culzean Castle, Ayrshire. He had an exhausted bed upon which he spread a good coating of this manure, watering it in. In a short time he was surprised to see the finest crop of Mushrooms he ever had; so thick were they growing, he said, that he could fill a big basket without moving a foot. We took out two trenches about 1 foot deep and 1 foot broad in spring, spread in it a small quantity of old Mushroom bed, planted the Tomatoes in rows in the usual way, giving round each plant a good dressing of the fertiliser. The result has been good crops of Tomatoes and as fine Mushrooms as ever were grown. They came up in great colonies round the stakes supporting the Tomato plants: and acting upon the advice given in Wright's "Mushrooms for the Million," of pulling them out by the roots, not cutting them off, we have had a succession of crops since August, and not exhausted yet. We watered in several dressings of the manure, which benefited the Tomatoes as well as the Mushrooms, and have given us a very profitable little border, indeed; we are getting 2s. per lb. for the latter, and some time ago had higher prices. We have gathered many Mushrooms 12 and 13 ozs., very fleshy, and a beautiful snow white colour, so much so that many visitors could scarcely believe them to be Mushrooms at all.—D. BUCHANAN.

ADIANTUM FARLEYENSE.

THINKING a few notes respecting the above beautiful Adiantum might be of interest to your correspondent Mr. C. Russell and others, I have taken the opportunity to give my method of cultivation, which is attended with every success. I grow eighteen plants ranging from about 4 feet in diameter down to 18 inches. The larger plants were only placed in the pots they now occupy about two years ago. These pots are from 13 to 15 inches in diameter. The smaller plants are mostly in 6 and 7-inch pots, and these sizes suit my requirements best. I have never until recently tried to what size they can be grown. That is the object for which I have repotted several of them, and at the present time they are thriving admirably.

I am of the opinion that this Adiantum succeeds best in yellow loam and leaf mould with plenty of opening material in the compost such as burnt marl pounded fairly small, or charcoal and silver sand. The drainage must be perfect or failure will be sure to follow. The plants alluded to are grown on a side slate stage covered with white spar at the end of the plant stove, with plenty of atmospheric moisture, but they are never syringed. This practice I disapprove of, as the dense habit of the plant causes the pinnæ of the fronds to damp when so treated, which badly disfigures them. They are never overwatered, and in the winter months the moisture is reduced both in the soil and in the atmosphere. The fronds with us assume the most beautiful tints. This I think must be due to the compost, or perhaps with growing them in a very light span-roofed house. Probably both play a part in it, for I do not think they care about much shade, providing they do not get the direct rays of the sun. I have never seen this Fern do well in

peat, and in poor soils it is always seen devoid of that beautiful tinge of colour in the fronds which is so much admired.

Having a number of plants in 8 and 9-inch pots which were getting impoverished, I split them up into sizes convenient to go into 6-inch pots a year ago last spring. They were placed in the above compost. For weeks they hardly grew at all, but at last they began to move more vigorously, and at the present time they are 18 inches in diameter and in a healthy condition. I may add we use liquid manure moderately in the summer months, but chiefly to plants that are root-bound.

What size this Fern can be grown to I cannot say, but Mr. Cromwell, now of Cleveley, Allerton, near Liverpool, once told me that he grew a specimen 7 feet in diameter in a compost of the above description, and exhibited the same at one of the Liverpool summer shows, but he said he had never reached that standard since. The general opinion is, I believe, that *A. farleyense* will grow to a certain size and then begin to decline.—J. J. C.

YOUR correspondent, Mr. C. Russell, on page 456 of last week's *Journal*, wishes to hear from those who are successful in growing this beautiful Fern. May I relate my experience with it? I had a few plants in 6-inch pots, which were used for table decoration from time to time, until they became root-bound. I placed them in 9-inch pots, and after a time transferred one to a 12-inch pot. Last year this plant measured 5 feet in diameter, when I gave it a shift to a 15-inch pot, and now it measures 5 feet 6 inches, and is growing fast. The plants are grown in a stove with other things which are syringed. I formerly used peat and sand for potting, but I find this Fern does much better potted in three parts fibrous loam to one of leaf soil with a sprinkling of coarse sand. I give them plenty of water in summer and a little weak liquid manure occasionally. I never allow them to become dry in winter, as they are always growing. Last spring I cut out all the old fronds from the largest plant.—CHARLES PAYNE, *Gardener, Trashurst, Dorking.*

PRICES OF APPLES—SALESMEN.

I NOTICE on page 302 (October 6th) a statement about the price of Domino Apples and value per tree. As an example of the uncertainties of fruit growing and the impossibility of counting one's chickens beforehand, I may say that, on looking over my returns, I find that the average price of this sort was about 2s. 9d. per bushel to the grower, instead of 6s., as reckoned by your correspondent, and that some which were sent to Covent Garden made there only 2s. per bushel, which is less than 1s. per bushel home after deducting rail, commission, return of empties, and cartage. At the time Domino made about 1s. home larger sorts made 2s. per bushel home for selected fruit. It is true that some of the others made sometimes during the season 6s. per bushel in Covent Garden, or about 4s. 9d. home, but this was very exceptional, and not the rule. The prices I obtained were better than that of my neighbour, and it will be seen from the above that the present is not a very favourable time for Apple growing for market, nor can the best acre be taken as an average. A grower here would have made about £800 nett profit if all his ground had done as well as the best acre of Plums and Apples, but instead of this he has a loss of several hundred pounds on the whole of his fruit ground.

I have got somewhat behind in my reading of the *Journal* owing to pressure of work. Since writing the foregoing I have read your notes in reference to the middleman on "The Fruit Supply and Prospects" on page 343. I think with you that it is impossible to do without salesmen, and if they act justly and uprightly they are a great benefit to the grower. It is manifestly impossible for the grower to send his fruit direct to the fruiterers of a large town and collect the money. It may be done in a few instances, but not as a general rule. If a grower is to have the salesman's profits, he must also have the salesman's expenses and losses. He would of necessity require a stand and an agent to receive the money, and to know current prices, also to know to whom he can safely sell. As it is common now to send to many different markets, one would be required at each, while often it would not answer to send fruit to several markets. It would be found far more convenient to have a reliable salesman who is already in business there, and who knows his customers and their wants.

I consider it is the salesman's business to advise his senders not only when to send, but also when not to send, and to guide him as to quantity, &c. This is also for his own interest, for a few heavy losses which might have been avoided by the salesman's acquainting the grower with the state of the market, make him fight shy of that market. Then, too, as regards the retailer. These are also a necessity unless the consumer requires a large quantity of

fruit, the extra carriage which is consequent upon the delivery of small parcels, would make the price as high as if he bought of the retailer, and he naturally likes to see what he is buying.

There are many other reasons which might be urged, such as the difficulty of attending to small orders, when tons of fruit are being dispatched daily, the bulk, or at any rate the residue of which would have to be sent to market. It is much more satisfactory to send large quantities regularly to as few salesmen as possible. At the same time it seems very unjust to the grower when he is getting 1d. a pound for fruit, to grow which he has been toiling for a whole year, and from which all his expenses for the year have to be deducted, to see it being retailed at 4d. and 6d. per pound. These profits have been supposed to be necessary to the retailer to enable him to get a living, but as you pointed out competition compels the retailer now to reduce profits, and it will doubtless be found that the increased sale, because prices are lower, enables him by turning over a larger quantity of fruit to get as good a living as before, while the consumers are benefited.

In consequence of the low prices of fruit, growers are compelled to enlarge their holdings in order to get the same living that they used to do from a smaller extent of ground. In this as in grocery, clothing, and other trades, the tendency seems to be for the business to drift into the hands of large growers who have sufficient capital to plant large areas and wait till the trees come into bearing.

It is not likely that prices of fruit will be anything but low while the present agricultural depression exists, and as long as fruit shows a margin of profit, farmers in fruit-growing counties will plant largely every year, and it is natural that if they find a good variety they should plant many trees of it. It appears very evident to me that if fruit growing is to pay, it must be by planting the best sorts, and cultivating and marketing the fruit in the best possible manner.—WALTER KRUSE.

WINTER FLOWERING PLANTS.

WHERE winter-flowering plants are extensively and properly cultivated there should be no lack of flowers all through the dull period of the year, and so many and varied are the plants adapted for this purpose that something may be found to suit even the most fastidious persons. I will place those which need a stove temperature first, and follow on with others that require cooler treatment. I have known instances of complete failures by placing some plants in too high and others in too cold a temperature, therefore great care should be exercised in this respect.

The Poinsettia is a good representative of this class of plants; for although it will succeed in a cool temperature during the summer, the plants require placing in a higher temperature about the beginning of September, or the leaves will quickly commence falling, and the proper development of the bracts will be prevented. *Plumbago rosea* is one of the brightest decorative plants that can be found, and is admirably adapted for arranging amongst other stove plants or treated as a climber for the roof. I use it for both purposes, but I think by far the best effect is produced when grown as a climber, for its lovely scarlet flowers when allowed to hang gracefully down have a very pleasing effect. It is not a suitable plant for cutting purposes, as the flowers will not keep longer than a day or two. *Impatiens* are also most useful for winter decoration. I think *I. flaccida alba* is decidedly the best, as it produces its pure white flowers in great profusion. By giving it a warm temperature the footstalks are much longer, thereby adding considerably to its usefulness. I must not close this short list of stove plants without briefly referring to *Calanthe Veitchii* and *C. vestita*, for two more useful plants for winter flowering would, I think, be difficult to find.

Passing to the intermediate house we find the most beautiful of all—viz., *Euphorbia jacquiniæflora*. The general practice is to give this plant stove heat, but I think it succeeds much better when grown in an intermediate temperature. I grow my plants in the latter structure all through the season, and they are now showing for flower splendidly, and are well feathered with foliage right down to the pots. *Eranthemum pulchellum* is decidedly one of the best of the winter-flowering *Eranthemums*. It succeeds admirably when placed in cold frames during the summer months, being stronger when so treated than when grown in heat; but it should be removed to the intermediate house about the end of August. *Goldfussia anisophylla* will succeed under similar treatment to the *Eranthemums*, as also will the beautiful yellow flowering *Reinwardtia tetragyne* (more commonly known under the name of *Linum trigynum*). These are free flowering plants, and worthy of more extensive cultivation than they at present receive. Some *Begonias* are also most useful plants for winter furnishing, and the following will be found suitable where house

room is limited:—*Begonia nitida*, very handsome deep rose flowers; *B. nitida alba*, similar to *nitida*, only smaller, and of the purest white; *B. fuchsioides*, rich deep scarlet; *B. Knowsleyana*, silvery blush; *B. manicata* and *hydrocotyfolia*, the two last named being especially valuable, owing to their dwarf habit and freedom of flowering. They are also very useful for drawing-room decoration, continuing to flower profusely for a long time. I must not conclude this selection without mentioning the splendid rich magenta variety John Heal, for when well grown this is, I think, second to none. I have a few plants flowering here at the present time, producing a most bright and effective display.

Coming now to the greenhouse, one might safely class the *Salvias* as being the most important. These may be had in flower all through the winter and spring months. The following will be found the most useful for a general collection: *S. Pitcheri*, lovely azure blue colour; *S. splendens*, a very beautiful variety, producing its bright scarlet flowers in great profusion all through the winter; *S. rutilans*, with flowers of a rich magenta shade, very free. *S. Grahami* is particularly valuable on account of its very dwarf habit and freedom of flowering, and its bright purple flowers look very pretty intermixed with other plants. *S. leucantha* and *S. Betheli* are most valuable for supplying a little variety of colour, the former being a mauve, and the latter a bright pink; nor must *S. gesneræflora* be forgotten, for it is truly one of the best and latest of the whole family. Its flowers are of a bright scarlet colour, being very conspicuous and produced in abundance. Then we have the *Bouvardia*, which is one of the most popular of all the winter flowers. These, however, should have a place in the intermediate house or warm conservatory. Zonal *Pelargoniums* are useful, and the same may be said of *Mignonette*, of which I think Miles' *Spiral* and *Machet* by far the best for winter work. *Eupatoriums*, *Schizanthus*, and *Marguerites* are also serviceable plants. *Cinerarias*, *Primulas*, and *Chrysanthemums* are of course the general favourites at this season, and when well grown make a grand display for some time. Before I close I must say a few words respecting *Carnations*, for no collection of winter flowering plants can be complete without them. The varieties grown here are *Miss Jolliffe*, *Winter Cheer*, *Madame Carle*, *Jean Sisley*, *Oriflamme*, *Alegatière*, and *La Favorite*, all of which are excellent. The *Marguerite Carnations* are also useful, and should be given a trial in all gardens.—G. PARRANT.

NOTES FROM IRELAND.

THE winter Show of the Royal Horticultural Society, held on November 17th and 18th, probably exceeded in the number and quality of its exhibits any previous exhibition. A new departure was inaugurated by holding the Show in the vast hall of the Royal Dublin Society's premises at Ball's Bridge. This is where our world-famous horse shows are held annually. The size of the building somewhat dwarfed the Exhibition, but half a dozen of our leading nurserymen materially assisted with fine groups of Palms and foliage plants, both hardy and exotic. The premier prize for a group of *Chrysanthemums* grown in pots, staged on a space of 50 square feet, was taken by Mrs. Bewley of Willow Park for an effective group. Plants generally were of a high quality, as also were cut blooms. The premier prize in this section for thirty-six blooms, half Japanese and half incurved, went to Mrs. Vaughan of Roscrea for a stand in which the incurveds were of marked excellence. A feature of the Show was a stand of six blooms of *Vivian* Morel of great size, depth, and substance, shown by the same lady, and deservedly taking first in its class.

Mr. Cummins, steward to Viscount Gough, had a stand, not for competition, of agricultural roots, thirteen or fourteen varieties, and thirty-three distinct varieties of Potatoes, fine clean samples. This stand, though lacking the bright colours of the floral exhibits, commended itself to the public by its utility and excellence. The first day was genial and fine, and brought an exceedingly good attendance, including His Excellency the Lord Lieutenant. The second day was wet, and only enthusiasts braved the weather.

Within a stone's throw of the Royal Dublin Society's premises are the Botanic Gardens of Trinity College. A peep in at Mr. Burbidge is a treat. It is a long stretch from here, under the cool skies of Erin, to Borneo, "the Gardens of the Sun," the scene of his former labours in the interest of science. The extensive borders are full of treasures and their labels, so full one wonders how they can be weeded or cleaned, but the fact is weeds have no room, and as for digging, that is a mystery.

Trinity College has been holding high festival in the celebration of its tercentenary this year. Some of the glass houses look as if they were verging on a tercentenary too. One ancient building in

particular seems to be supported by the friendly fronds of magnificent Palms, excelsior-like, pressing the antique roof. More modern structures are filled with Orchids, and one long low house we peep into, to go in would be sacrilege, for fronds are meeting across the walk. How are they watered and attended to? Well, like the borders, that is another mystery. *Nepenthes* lead one to inquire for The Rajah, that carnivorous wonder which Mr. Burbidge loaded his Indians with on Kina Balu. But, alas! it is not, though Glasnevin possesses one.

Some gems of *Crocus* species are in flower outside, looking too fragile for a November day, whilst the earliest *Narcissus* braves the wintry winds. Memory recalls the privilege of seeing the great collection of *Narcissi* in flower five years since, and that was a red-letter day in the life of—E. K.

A SUB-TROPICAL BORDER.

A FINE-FOLIAGE or sub-tropical border forms a conspicuous feature in pleasure grounds, and always commands admiration providing suitable material and position are available. The position should if possible be sheltered from rough winds, which would break and disfigure the large and tender foliage of the plants used. A good situation for such a border is at the end of a sweep of lawn, or as a background of a design of flower beds, which serves as a foil to the brighter colours of the ordinary occupants of the beds. The soil should be rich and open; that will ensure the plants making vigorous growth and bring out their characteristics. Leaf mould, thoroughly decayed manure, burnt earth, sand, and old compost from the potting bench may be added if deficient in this respect.

The plants most suitable for the purpose are Palms (*Chamærops* and *Phoenix*), *Aralia*, *Ficus elastica*, *Acacias*, *Melanthus*, *Succulents*, *Grevilleas*, and *Musa Cavendishi*, if in a very sheltered position. Other plants, such as *Wigandias*, *Cannabis gigantea*, *Variegated Maize*, *Giant Tobaccos*, the fine-foliage *Solanums*, *Lavatera arborea*, *Ricinus Gibsoni*, and *Erythrolæna conspicua* are among the best to use. These may be raised from seed sown early in the spring and grown quickly and strongly in order to have them well hardened off when planting time arrives. *Acanthus latifolius*, *Chamæpeuce diacantha* and *Cassabonæ*, and a crown or two of the *Globe Artichoke* may be used with good effect. In planting, consideration should be given to the ultimate height and size of the various plants so as to obtain a graduated outline from back to front, but while avoiding undue crowding let each plant fill its allotted space.

A border arranged in the following order was much admired here during the past summer. Back row: *Cannabis* and *Sun-flowers*. These grew to 11 feet in height. Second row: *Tobaccos*, *Wigandia*, large *Acacias*, *Ricinus Gibsoni*, and *Ferdinandias*. Third row: *Cannabis*, *Variegated Maize*, *Melanthus major*, *Ficus elastica*, and a centre plant of *Musa*. Fourth: *Erythrolæna*, *Globe Artichoke*, and *Solanums*. Fifth: *Grevillea*, and smaller plants of *Acacia lophantha*, large plants of *Echeveria metallica*, *Perilla* in clumps, *Chamæpeuce diacantha* and *Cassabonæ*, with an edging off of *Centaurea candidissima* and *Iresine alternately*.—W. H. STEPHENS, *The Gardens, Prescott House*.

PEACHES ON OPEN WALLS.

I THINK maiden trees are the best if planted early in the autumn, and all the shoots required for a foundation simply nailed to the walls. I have seen the trees at some nurseries with all shoots cut clean out, not one left at the base to shelter the main stem. If the shoots were pinched to four leaves there would be some chance for the grower to cover the stem to the ground line, which I consider of great importance in the south. Sun-burnt trees must follow if there are no leaves on the main stem. If nurserymen clear all the growth, say, 2 feet from the base, there is nothing for us to do but to train back shoots to cover the leafless base. I have had maiden trees of *Alexander* carry two dozen fruit the second year after being planted, and the required space covered in four to five years. In most cases it takes that number of years before these cut-back trees are able to leave the nursery.

I have tried *Alexander*, *Waterloo*, and *Amsden June*; all ripen about the same time, and I see no difference in them. If anything, *Amsden June* affords the best fruit, and does not lose any buds; moreover, it stands the frost better than the others. *Hale's Early* is a grand Peach. *Crimson Galande* is a fine midseason variety, whereas *Sea Eagle* is woolly looking and coarse. *Princess of Wales* always does well, as also does *Thames Bank*, both ripening about the same time. Mr. Gladstone ripened in September, the fruit being very large, fair flavour, but has a woolly surface that I do not admire. *Golden Eagle* should be grown in preference to *Salwey*, for it is always good flavoured, and it has a future as a late Peach. With the exception of *Pitmaston Orange*, *Nectarines* are not satisfactory here.—H. GALTON, *Shawford, near Winchester*.

DATES OF SHOWS FOR 1893.

IN the past many smart things have been done by the Birmingham and Kingston Chrysanthemum Societies, but none which redounds to their credit more than the fixing of the dates of their exhibitions for the coming year. The latter have chosen Tuesday and Wednesday, November 7th and 8th, while Wednesday and Thursday, November 15th and 16th, are the dates selected by the Midland Society. Such an early date to announce their fixtures is a commendable action, as opportunities are given for other societies to make their arrangements with a view to avoiding a clashing of dates. Not only is this early date fixing good for the Society itself, but it is equally so for intending competitors who know exactly now how to shape their course. Where societies, like the two in question, have not to depend upon circumstances with regard to knowing how their balance at the bank is likely to guide the arrangement of their schedules for the coming year, there seems to be no reason why the schedules of prizes should not very shortly be issued. This would relieve competitors very much of the anxiety of knowing whether they are likely to have too few or too many varieties in any section. When the issue of an important schedule is deferred until say April, it is then too late to make any great alterations in the stock of plants. I have known exhibitors blamed for not filling particular classes better than they did, but the reason lay with the executive rather than the growers. I hope very shortly to hear that the dates of the N.C.S. are fixed, and that the schedule of prizes is being prepared.—E. MOLYNEUX.

THE NATIONAL CHRYSANTHEMUM SOCIETY.

I HAVE never yet known a horticultural society, and more especially a special society, whose head quarters are in London, that did not, or does not, at some time or other, have directed against it such a sarcasm as being a "London clique." The reason is not far to seek. It is in the nature of things that any society of the kind established in London will be governed mainly by London men. London is the great centre of floricultural enterprise, and the most earnest enthusiasts are found there. But I know of no special society (and I am connected in some way or the other with many of them) against which the charge of "London cliquism" can be more unjustly brought than the National Chrysanthemum Society. If Mr. Chas. E. Pearson will take the trouble to inquire a little more closely into the methods of this Society he will find it offers the greatest facilities for the principal provincial centres being in touch with it. We have in affiliation with the National Chrysanthemum Society some eighty-five provincial societies, representing many of the leading Chrysanthemum growing districts. Every one of these affiliated societies has the privilege of nominating a representative on the General Committee, who is invited to all its meetings, and who has as much influence in determining the policy of the Society as an elected member; a considerable number of these representatives attend the meetings, and act cordially with the elected members.

There are thirty-six elected members in addition to the officers making in all forty-two, and if it be true there be safety in numbers it is amply secured. I have now been a member of the Committee for some eight years, and I witness plenty of independence of speech and act, but nothing which can be designated "cliquism." I can truly say that the elected Committee represent all interests, large and small, in relation to Chrysanthemum culture. How much the services of a provincial grower of repute are welcomed was seen in the position on the poll occupied by Mr. W. Herbert Fowler of Taunton, at the last election. As the Nottingham and Notts Chrysanthemum Association is in affiliation with the National Chrysanthemum Society, let Mr. Pearson get himself appointed as its representative on our Committee, and come among us and become acquainted more fully with our procedure, and I am quite certain that with wider knowledge there will inevitably follow a more enlightened and juster conception of the methods of the National Chrysanthemum Society.—RICHARD DEAN, *Secretary*.

THE WAKEFIELD PAXTON SOCIETY'S CHRYSANTHEMUM SHOW.

THERE was a very large gathering at the Paxton Society's meeting on November 20th, and the proceedings were of a most interesting character. Mr. J. G. Brown presided, and Mr. B. Whiteley was in the vice-chair. The subject for the evening's discussion was "The Chrysanthemum," and there was a large and magnificent display of exceptionally well grown blooms. The flowers had been sent by various professional and amateur gardeners, and they were well staged by Mr. W. Blackburn, who was recently appointed Curator to the Society in the place of the late Mr. Arthur Lupton. It was generally admitted that the largest and best collection on view was a stand of thirty-six exceedingly fine, large, and well-formed flowers of various tints, and of the Japanese, incurved, and reflexed varieties from Miss Edith G. Mackie's grounds at St. John's, where there is at present an extensive and most attractive collection of the best varieties. Considering the very unfavourable season the flowers were marvellous productions, and Mr. Garnett was warmly complimented on the success which had attended his efforts. A discussion on the subject of Chrysanthemum growing took place, which

was continued until a late hour, and great interest was evinced in the proceedings. Miss Mackie's Chrysanthemums have been open to the inspection of the public, and the privilege so kindly accorded has been highly appreciated.

AYRSHIRE CHRYSANTHEMUM SHOW.

WE understand that a proposal has been made to provide a silver cup for competition at the Chrysanthemum Show of the Ayrshire Horticultural Society next year. This is to encourage the cultivation of Chrysanthemums in that district.

SPORT FROM MRS. H. CANNELL.

I AM sending you by this post a bloom of Chrysanthemum, a yellow sport from Mrs. H. Cannell. Kindly inform me if it is new. It has all the properties of Mrs. H. Cannell, and is a late bloomer, which is a great advantage.—W. E. TIDY.

[Your primrose sport from Mrs. H. Cannell is certainly worth growing well. The colour is very pleasing, and the florets broad and smooth. We have seen very similar blooms of Miss Kate Mursell, a sport from Lady Lawrence.]

CHRYSANTHEMUM RICHARD PARKER.

I HAVE not seen this variety exhibited anywhere this autumn, nor have I noticed any account of it being shown, not even before the Floral Committee of the N.C.S. Richard Parker was sent out last spring at the high price of 10s. 6d. each plant, with a glowing description; but with me I cannot see any difference between that variety and Miss M. A. Haggas. Have any of your readers seen good blooms of it?—G. F.

[We have reason to believe that many Chrysanthemum growers do not consider Richard Parker and Miss M. A. Haggas sufficiently distinct.]

QUEEN SPORT.

I HAVE sent for your inspection three flowers of Chrysanthemums cut from one plant. Will you kindly say if No. 2 is worth keeping, as it seems to me to be distinct from Queen of England and Empress of India? No. 3 can only be a curious freak, and the peculiarity would presumably not be perpetuated. No. 1 is from the original.—WM. GRIX.

[No. 1 is the true Queen. No. 2 is a larger, a very delicate flesh-tinted bloom with narrow florets, distinct, but of doubtful value; still, it might be fixed with the view to testing its character. No. 3 is half Empress of India, pure and good; the other half not Queen of England, but Alfred Salter in its best colour. Four varieties were, therefore, presented by this sportive plant and all distinct. 1, The Queen (original); 2, the tinted sport; 3, Empress of India; 4, Alfred Salter; both varieties clearly defined from the same receptacle. It may be added that Alfred Salter was a sport from the Queen of England.]

EDINBURGH CHRYSANTHEMUM SHOW.

THE magnificent silver cup, presented by the magistrates and Council of the city to the Scottish Horticultural Association for competition at the Chrysanthemum Show recently held in the Waverley Market, and won by Mr. R. Parker, gardener to Mr. J. Corbett, M.P., Impney Hall, Droitwich, Worcester, is circular in form, with two massive handles. The body is fluted, and in the front and back there are shields bearing respectively the arms of the Association and the following inscription:—"Presented by the Magistrates and Council of the City of Edinburgh to the Scottish Horticultural Association. The Right Honourable James Alexander Russell, Lord Provost.—November 1892." The cup was specially designed and manufactured by Messrs. Brook & Son, goldsmiths to the Queen, 87, George Street, Edinburgh.

PREMIER BLOOMS.

THESE are always objects of special interest at Chrysanthemum shows, and wherever selected are considered as highly honoured by the possessors. In some shows these classes have fallen into disuse, notably as I learn for the reason that it is found the awards invariably go to exhibitors of the prize collections. That is, of course, natural. At one large suburban show an effort has been made to revive the premier bloom class, and, to give every exhibitor a chance, it is proposed that, beyond the flowers in the respective cut bloom classes, it be open for anyone to stage a single bloom for the premier competition. It is proposed to have flowers on plants, as it is difficult for judges to compare these with other blooms. It may be that some growers who have not enough good flowers to compete in an ordinary class yet can show one bloom of exceptional merits.—D.

ENGLISH-GROWN BLOOMS FOR NEW ZEALAND.

To reciprocate the services of Mr. J. Earland, Wellington, who sent Chrysanthemum blooms frozen in ice for exhibition in this country early in the autumn, the National Chrysanthemum Society have, through Mr. R. Ballantine, made arrangements for sending some English-grown flowers to New Zealand. Twelve of the best Japanese blooms were selected from the forty-eight, which secured Mr. W. Herbert Fowler, Taunton, the first prize at the recent Royal Aquarium Exhibition, and a similar number of incurved flowers from Mr. W. Mease, gardener to A. Tate, Esq., Downside, Leatherhead, and shown at Kingston. These were, under the guidance of Mr. Kaye, the manager of the Blackfriars Cold Storage Works, placed with the cups and tubes in zinc vessels (one bloom in each), 15 inches in depth and wide enough to admit of 3 inches of water being around the blooms. They were then frozen, which process occupied four days, and the vessels were packed in sawdust in strong wooden cases, which are being despatched

to the Antipodes. It is expected that the blooms will reach New Zealand in time to be exhibited at the Wellington Chrysanthemum Society's Show in April.

FROZEN BLOOMS TO NEW ZEALAND.

WHAT the Committee of the National Chrysanthemum Society are just now doing in sending out frozen Chrysanthemum blooms to New Zealand, shows what it is possible for private traders to do if they wish in Dahlias, Roses, Gladioli, Begonias, and many similar flowers. Who can tell what possibilities of future trade may not be found in this method of sending sample flowers immense distances? The N.C.S. Committee have been very fortunate in sending a batch of first-class blooms. The Mayor of Taunton, Mr. Fowler, had had the best, though not the biggest, Japanese this year, and Mr. Mease of Downside had had some of the best incurved flowers grown. It would be specially interesting to be with our antipodal friends when they see these examples.—D.

CHRYSANTHEMUM HOUSE IN FINSBURY PARK.

WE are informed that the Parks Committee of the London County Council have considered it desirable to erect a structure as a show house for Chrysanthemums in Finsbury Park. It is stated that £1000 will be spent on the building. Similar houses should be erected in many of the other parks where Chrysanthemums are grown.

VISITORS AT BATTERSEA PARK.

DURING the annual Show of Chrysanthemums at this park, which closed on November 26th, the number of visitors reached the enormous total of slightly over 39,900, the greatest number in one day being 5890. These figures show an increase over last year's total of 11,500, which is most creditable to Mr. Coppin, who provided a magnificent display. Unfortunately the structure is totally inadequate, and it would be a highly appreciated boon to thousands if the London County Council could provide better accommodation.

CHRYSANTHEMUMS IN THE LONDON PARKS.

THERE is a rumour afloat that the London County Council intend to organise a competition for the most effective exhibition of Chrysanthemums amongst the superintendents of the parks. It will be pertinent to ask how a fair competition can be carried out, since the conveniences at the command of the different men vary so greatly. If allowances are to be made on this account who is to make them? It would need very able judges to award the palm, and their task would be an invidious one. Then, again, what good purpose would be served by such a contest? It may be replied that the plants would be better grown and the collections more attractive to the general public, but no great improvement would be made in the existing displays unless (1) more assistance were provided, or (2) other work neglected. The various superintendents do not require any such stimulus in catering for the public.—VISITOR.

[Surely it would not be inappropriate to confer on these capable men some mark of recognition for their services.]

CHRYSANTHEMUMS AT MOOR PARK.

MR. HAGGART, who has been head gardener at Moor Park, Ludlow, for nearly twelve years, commenced growing Chrysanthemums soon after he took charge of the gardens. He has now one of the choicest collections possible to see in the neighbourhood. Not only are large blooms for show purposes produced, but bush plants are also grown in quantity. Mr. Haggart is well known for his successes with Chrysanthemums at past Birmingham Shows, but this year he has not exhibited, having been obliged to make his best display by November 1st.

About 600 plants are grown. Amongst new varieties in a Peach case I recently noticed well-coloured flowers of Alberic Lunden, R. J. Kingston, Violet Rose, May Tomlin, W. Tricker, Richard Parker, Mrs. Robinson King, Madame Darrier, Camille Flamarion, Mr. E. Beckett, Vice-President Audiguier, Mdlle. M. Hoste, and Mrs. Irving Clarke. The incurved varieties were also good, the Queen, Princess, and Teck families being especially fine. Mr. Haggart keeps each class separate, which makes a visit interesting, instructive, and useful. The best display was in the conservatory in the form of a triangular bank. The plants were 2½ to 8 feet in height, and the whole of the blooms were of good colour, size, and substance. Amongst Japanese, Etoile de Lyon, Stanstead White, Marsa, Kioto, Thunberg, Sunflower, Madame Baco, Avalanche, Golden Dragon, Meg Merrilies, and others were all well represented. Louis Boehmer and Mrs. Alpheus Hardy had excellent flowers.—JOHN CHINNERY.

CHRYSANTHEMUMS AT THE OLDFIELD NURSERIES.

A VISIT to the Oldfield nurseries of Messrs. Clibran & Son, Altrincham, is always interesting, and at no time of the year more so than in the Chrysanthemum season. A recent visit fully convinced me that they do all they possibly can to keep pace with the times, and succeed in doing so. The main show house is a large span-roofed structure 210 feet long by 30 feet wide, in three divisions; some 3000 plants were arranged in sloping banks, the path being in the centre. All the best varieties obtainable were represented. I took down the names of some varieties which ought to prove decided acquisitions.

In the ostrich plume varieties *Enfant des Deux Mondes* and *William Falconer* were very fine, the former of vigorous habit, flowers large and freely produced, opening clear yellow passing to pearly white, with base of florets shaded cream, exterior ones straight, interior florets incurved, whilst the hairy character is more apparent than in Mrs. Alpheus Hardy. The latter is a sport from Louis Boehmer, but of more robust constitu-

tion. Amongst the Japanese there were some fine blooms of Alberic Lunden, the flowers being carmine crimson and the habit everything to be desired. Cleopatra is a fine white variety with very long florets. Col. W. B. Smith is one of the grandest varieties ever sent out. It has been mentioned so much in these pages that it is useless to reiterate. The beautiful Eynsford White has been in very fine condition. G. C. Schwabe, a lovely variety after the build of E. Molyneux, carmine rose, is a first-class show variety. George W. Childs, a reflexed Jap of immense size, with broad stiff petals, colour deep velvety crimson, is very distinct; the flowers are borne on very strong stiff stems. J. P. Kendall, silvery amaranth reflexed rose cerise, very broad incurving florets, a large full flower. J. Stanborough Dibben, golden yellow shaded bronze, magnificent flowers 6 or 7 inches deep. Lord Brooke figured in last week's issue, likely to prove a grand variety. Marquis de Paris, large flower, deep pink mottled white. Mattie C. Stuart, a very high-built bloom of a bright golden yellow colour, extra large. Mr. Chas. E. Shea, the yellow sport from Mdle. Lacroix, a grand variety for decorative work, a beautiful shade. Mr. G. Herring, crimson carmine with twisted and pointed florets, a very fine show variety, and of excellent habit. Mrs. E. D. Adams, white, shaded rose, large long petals and very dwarf habit. Mrs. Libbie Allen, well formed large yellow flowers. Ph. Rivoire, a grand back row flower of immense size, florets large and long, colour pale yellow passing to creamy white, one of the finest novelties of the season. R. C. Kingston, fine dark purple of largest size, good habit and a grand show variety. W. Tricker, now well known; and F. W. Flight, crimson carmine, golden reverse, florets long and broad, very fine.

The newer incurved were Ami Hoste, dark buff, yellow striped, exhibited this season with considerable success; Madame Darrier, Madame Frederic Mistral, light violet rose with violet tips; Miss Bella Wilson, a large globular flower of a delicate satiny grey, changing to lilac, fine habit and robust constitution. Anemone-flowered were Delaware, Mrs. Judge Benedict, and Souvenir de Madame Blandinieres; the two former white and the latter rosy crimson tipped gold. In the early flowering section the following varieties, which have been in flower from July onwards, will not be likely to disappoint cultivators:—Ami Mezard, Charles de Cazanove, Jean Nicholas, Madame Greard, Madame Jacob, Madame Marie Constans, Marquis de Martmort, M. Frederic, L'Usmayer, President Leon Say, President Rene de St. Foix, and Vice-President Hardy. They are correctly described in the catalogue. Propagation was being rapidly conducted. Every precaution is used to keep the varieties true to name, and altogether the work is carried out in a thorough businesslike manner, as is everything throughout the establishment.—A VISITOR.

GARDENERS' ROYAL BENEVOLENT INSTITUTION AND YOUNG MEN.

It was very gratifying to read the announcement of the result of the evening's subscription at the anniversary dinner of this excellent Institution, but the gardeners of the United Kingdom should not rest content, as the amount, however, good and gratifying, is totally inadequate even with the funds in hand, to meet half of the applicants for help, the majority of whom must be in a very distressed condition. I am afraid that gardeners do not support the institution as they ought. They should also remember that many can help one or a few, where a few cannot help many.

Anyone who has attended the meetings connected with the Institution cannot fail to have noticed the hearty goodwill in which the various members of the committee work for gardeners or their widows in distress. We should as gardeners remember, that although we may now be in good health and in the prime of life, old age soon creeps upon us, and we never know what may happen, through perhaps no fault of our own to prevent us securing a competence for old age. We should not, however, think of ourselves alone except to hope we may never need assistance, but of those needy applicants now waiting for an opportunity of being placed on the funds of the Institution, yet who for the want of capital have to wait year after year, living on hope which never comes, until the workhouse or death claims them.

I think the majority of gardeners who join the Institution (leaving out those who never think about it except when the hour of need comes) do not do so so early in life as they ought. In thinking of some scheme by which young men could be persuaded to join, I suggest that journeyman gardeners should be admitted at 2s. 6d. per annum, foremen 5s., and when they become head gardeners let them increase their subscription to 1 guinea.

To make them—i.e., young men—feel they have some responsibility let those who subscribe 2s. 6d. have one vote, 5s. two votes, and after subscribing the maximum amount the full complement of votes. All subscriptions to be acknowledged by postcard or letter circular. To insure the payments being made regularly I am sure the gardening press would be only too pleased to make any announcement, say at the end of each year as a reminder.

No doubt the above scheme if carried out would entail more work on the officials of the Institution, but I am of opinion that the response would amply compensate for any extra outlay. Let the proposition be discussed in the Press and amendments submitted. The commencement of the financial year will soon be here, and according to the support afforded so would the Institution be in a condition to make arrangements as to whether the scheme is workable.—A WELL-WISHER.

[Our correspondent is a gardener and a member of the Institution. His motive is admirable, and our columns are open for the discussion for his well-intentioned proposition.]

EVENTS OF THE WEEK.—But few horticultural events of especial interest will take place in the metropolis during the ensuing week. The Gardeners' Orphan Fund will, however, take a benefit at "Venice in London," at the Olympia, commencing on Monday, December 5th, continuing for a fortnight. There will also be the customary exhibits of roots and seeds at the Smithfield Show, which opens on December 5th. A meeting of the Floral Committee of the National Chrysanthemum Society is reported to be held at the Royal Aquarium on December 7th.

— THE WEATHER IN LONDON.—The weather in the metropolis during the past week has been mild for the time of year. Sunday opened bright and spring like; Monday, however, proved dull. On Tuesday rain fell rather heavily during the day, but it cleared in the evening and became colder. At the time of going to press it is bright, but with rather a keen wind.

— THE WEATHER IN THE NORTH.—A gale of wind with heavy rain during the night of the 28th cleared the air, which for the past two weeks has been dull, cold and wet, with an occasional watery gleam of sunshine. The night of the 25th was also very wet. Not much frost has occurred, the most severe being 5° on the morning of the 23rd. There is need of drier weather to admit of ploughing being got forward. B. D., S. Perthshire.

— THE GARDENERS' ORPHAN FUND.—We understand that the Committee of this charitable organisation has arranged with Mr. Imre Kiralfy to take a ticket benefit at Olympia during the fortnight commencing on December 5th, in aid of the Orphan Fund. We need hardly remind readers that Olympia is situated close to Addison Road Station, West Kensington, and the entertainment admirably represents life in Venice.

— MEETINGS AT THE DRILL HALL.—I should like to suggest that for many reasons it would be better both for those attending the Royal Horticultural Society's meetings at the Drill Hall, and the readers of papers, if the general meetings now held at three o'clock could be started during the four winter months at 2 P.M. or 2.30. Almost always the hour from two o'clock to three o'clock seems to be wasted, and many who would otherwise stop to hear the papers, leave early, because they cannot remain so late, and especially in such a cold hall. It is very discouraging to the readers of the papers in the winter to find that their audience comprises hardly a score of persons, and it is far from being complimentary. I wish the Council would consider this suggestion, as I am sure it would be a step in the right direction.—A FELLOW.

— ORANGES AND LEMONS FROM CALABRIA.—According to a recently issued Foreign Office report referring to the trade of Naples the produce of Oranges and Lemons last year was very satisfactory both to producers and merchants, having reached the total amount of 57,000 tons, of the value of £285,000. The fruits have risen in price of late, owing principally to the facilities granted by the railway companies, by which means a great quantity is exported to the north of Italy, where the fruit is largely consumed. It seems that no direct exportation of Oranges and Lemons was effected from Calabria during 1891, except a small quantity of salted Citrons for Russia.

— MARKET FARMING.—Talking with one of those hard-working pushing persons, a Middlesex market gardener, the other day, he told me of a fine farm of 600 acres in Hampshire just evacuated, though there were on it some fine buildings, and the rent was but 5s. per acre. He said "I am paying in Middlesex from £3 10s. to £5 10s. per acre, and get a good living even at that. Were I a younger man I would jump at the chance to take this farm, put down 100 acres in Potatoes, 100 acres in Peas, some in Brussels Sprouts, and some in corn and roots for stock, and I would make it pay." It is a striking fact that market gardening does pay better than farming, also that it gives per acre from four to five times the labour, and that much better paid. Railways have largely solved the problem of distance both for marketing crops and manures. Whatever may be the lot of agriculture market gardening conducted by able energetic men is prospering.—A. D.

— THE WEATHER IN KIRKCUDBRIGHTSHIRE.—Heavy rain fell on Sunday morning, and again at night, continuing until about 9 A.M. on Monday, 28th ult. At the time of writing the weather is dry, but stormy looking. No frost was registered during the week.—S. ARNOTT.

— NATIONAL AMATEUR GARDENERS' ASSOCIATION.—The annual dinner of this Association will take place at the Holborn Restaurant, on Tuesday evening, December 13th, at seven o'clock. The medals, certificates, and other awards won during the year, will be presented to the respective winners on this occasion.

— DAFFODILS DESTROYED BY FIRE.—According to the local papers Mr. W. B. Hartland of Cork, lost, through fire, a large number of White Trumpet Daffodils on the 17th ult. It is stated that a number of Colleen Bawn, comprising 600 bulbs, were totally destroyed. We sympathise with Mr. Hartland in his loss.

— CEPHALOTUS FOLLICULARIS.—We have rarely seen this beautiful plant in such fine condition as it is in Messrs. Low & Son's nursery. It is full of pitchers, and presents a most effective appearance. Lovers of Pitcher plants should procure this little gem. There is no doubt that it is often kept too warm.

— DAVALLIA ASSAMICA.—This rare Fern may be seen in the fine collection of Messrs. Low & Son at Clapton. The plant is claimed to be the only one in commerce, and on this account possesses exceptional interest. It is a graceful species, with both barren and fertile fronds, of which the latter are the most pleasing in appearance.

— CARNATION WINTER CHEER.—At Messrs. J. Veitch & Sons' Chelsea Nursery last week, I saw a bed of this dwarf-growing Carnation with a few of its bright crimson flowers still showing. There were also numbers of buds, which, if the present mild weather continues, will doubtless open. It is possible that, given a fairly mild winter and a protection of matting or similar material during sharp frosts, this variety may be had in flower most of the winter. For late and continuous flowering this variety is unexcelled.—J. W. J.

— ACADEMICAL APPOINTMENT.—Mr. Francis Darwin, at present Reader in Botany at Cambridge, has, on the nomination of Professor Babington, been appointed Deputy Professor for the current academical year. Mr. Darwin, who is a son of the great naturalist, is the joint author of "The Power of Movement in Plants." He has written various papers on physiological botany, and was editor of "The Life and Letters of Charles Darwin," which appeared some five years ago. He has also prepared the "short autobiography" of his father just published by Mr. Murray.

— HEAVY DOYENNE DU COMICE PEARS.—Some remarkably fine fruit of this grand Pear were grown on a young tree in Marston Gardens, Frome. The crop was rather light, all the flowers that first opened, and many of the buds as well, being destroyed by frosts. When gathered several of the fruits weighed about 20 ozs., and none lighter than 14 ozs. They were well formed, and clear in skin; but did not carry much colour. Some of these Pears were shown at the Bristol Chrysanthemum and Fruit Show, and were generally supposed to be equal to the best samples sent to the mainland from Jersey and elsewhere. It should be added that the tree is on the Quince stock, fan shaped; and, thanks to the strong clayey loam in which it is planted, is full of vigour. It occupies a rather warm corner near to a junction of south-east with a south-west wall.—R. H.

— A LUCKY SHOWMAN.—Surely the north of England is becoming famous for express Grape growing. Not long ago a gardener at Sunderland detailed his practice, as reported in the *Journal*, by which he produced ripe Grapes in ninety days; but this is now excelled by the gardener who secured the first prize at the South Shields and Northern Counties Show, November 9th and 10th, for the best dish of black Grapes, to which was also awarded a silver medal in recognition of superior cultural skill. Seeing that the gardener in question did not enter on his duties until August 15th of the present year, his success is highly creditable, and I have no doubt some notes on how to produce "finely finished black Alicante bunches" in eighty-six days would be greatly appreciated by many readers. Seriously, I would ask if it is fair and right for one man to thus reap the reward of another man's labour and cultural skill. I saw those same Alicantes only a fortnight before the present gardener took charge, and they were almost finished then. I think honour should be given to whom it is due. What say others?—CHAS. PORTSMOUTH.

— POTATOES IN IRELAND.—Under the auspices of the Royal Dublin Society a series of experiments in Potato culture were carried out during the past season. Among the varieties grown The Farmer proved the most productive, following which came The Bruce, Antrim, Scotch Champion, and The Colonel. The best quality varieties, however, were Antrim, Scotch Champion, and The Bruce.

— CHICAGO EXHIBITION.—We understand that Mr. J. McIndoe, gardener to Sir J. W. Pease, Bart., M.P., Hutton Hall, has accepted a special invitation from the Executive of the above Exhibition (department of horticulture) to exhibit at their great Show next autumn a collection of fruit similar to the one that he staged at the International Horticultural Exhibition held at Earl's Court, London, last August.

— CALLA LITTLE GEM.—During a brief visit to Messrs. Cutbush and Sons, Highgate, a few days ago, I noticed a span-roof house full of this dwarf Calla. The plants were chiefly young stock, but judging by the appearance of those in flower, I have no doubt that the variety, owing to its compact habit, will prove useful for small structures. There will doubtless be a good demand for it when better known.—J. W. J.

— THE DARWIN MEDAL.—Among other awards made by the Royal Society the Darwin medal has been awarded to Sir Joseph Dalton Hooker, F.R.S., on account of his important contributions to the progress of systematic botany, as evidenced by the "Genera Plantarum," and the "Flora Indica," but more especially on account of his intimate association with Mr. Darwin in the studies preliminary to the "Origin of Species."

— ALLOTMENTS IN LINCOLNSHIRE.—The Spalding Rural Sanitary Authority have taken a farm of 43 acres to let out in allotments to the labourers of Pinchbeck West. The land is being allotted in acre plots, and the rent charged is to be 45s. an acre, including all outgoings. The farm is well situated, and this is regarded as one of the most promising efforts for the extension of the allotments system in South Lincolnshire.

— THE TRADE IN OLIVES AND OLIVE OIL.—The last crop of Olives was a medium one, according to the consular report from Malaga. The production of Olive oil in Spain is stated to be nearly two million litres of oil, or about half of that of the European countries producing Olives. Italy takes the second place, and France the third; but the latter is small in extent of its output to the two former. The cultivation of the Olive seems to yield very unequal results, so that it is possible that it may be to that fact that the limited cultivation is due.

— LONDON PANSY SOCIETY.—The formation meeting of this Society was held at the Guildhall Tavern on November 24th. A number of gentlemen interested in the subject attended, and the Society being formed, rules, &c., were drawn up, which will be submitted to a general meeting to be held early in January, 1893. The Hon. Treasurer is Mr. Ranger Johnson, 14, Faunce Street, Kennington Park, S.E.; Hon. Secretary, Mr. Geo. McLeod, Chingford, from whom information can be obtained regarding the objects of the Society and rules of membership.

— WELL GROWN EUCHARIS PLANTS.—As a regular reader of the *Journal of Horticulture* I have from time to time noticed references to the culture of the Eucharis, but it is seldom that the size of the pots in which the plants are grown is mentioned. The Eucharis plants here are grown in 10 and 12-inch pots, and a dozen of them are now in full bloom. On the average there are about twelve or thirteen spikes on each plant each spike carrying four and five and six blooms, thus making an average of sixty flowers to a plant. On the largest plant, in a 12-inch pot, there are sixty-nine blooms, and of that number between fifty and sixty are fully expanded. I might mention that the same plants flowered about nine weeks ago.—J. ASHTON, Foreman, Kilworth House Gardens, Rugby.

— THE MARGARET CARNATIONS AND PINKS.—I am sure we are greatly indebted to Mr. Dean for having given and elicited so much information and opinion regarding the Margaret Carnations and Pinks. On reading the notes on page 391, I examined my few plants, and am disposed to agree with Dr. Hogg as to their probable parentage. The notes alluded to also reminded me of one notable characteristic of these "Carnations," which I noticed on first seeing them some three years ago—viz., the narrowness of the foliage. This had escaped my memory until then. It is highly desirable that at this stage we should have, if possible, precise knowledge of the parentage of these flowers. I hope to obtain this, and shall be glad to acquaint Mr. Dean of anything further I may hear on the subject.—S. ARNOTT.

— **POTATO CULTURE IN AMERICA.**—The greatest Potato-producing State in America is New York, which devotes to the crop (round numbers being used in all cases) 370,000 acres and raises 30,000,000 bushels, or fully one-seventh of the entire crop of the country. Iowa is second in the amount raised—17,000,000 bushels—though its area of 187,000 acres is eclipsed by the 203,000 acres which Pennsylvania gives to the raising of 16,000,000 bushels. Illinois comes next, both in area and quantity of product, while Wisconsin and Kansas cross each other for fifth place.

— **MEDICINAL PLANTS.**—A paper on "The Study of Botany" was read by Mr. Mair, dispenser to the Royal Infirmary, before a recent meeting of the Chemists' Assistants' Association, Dundee. A course of study suitable for pharmaceutical students, which had met with the approval of the leading botanical authorities, was fully explained, and illustrated with numerous specimens. Mr. Mair, in the course of his lecture, suggested that some attention should be paid to the requirements of medical and pharmaceutical students by local authorities, and that the plants in public parks should be classified and named.

— **ACACIA PLATYPTERA.**—At the present time there is nothing more showy in the greenhouse at Kew than *Acacia platyptera*. This plant is well adapted for pot culture, and, like most of the *Acacias*, is of easy culture. After flowering the plants should be cut back and kept syringed so as to make them break freely. When the plants are growing the worst enemy is thrip; a good syringing with tobacco water will rid the plants of this pest. To insure a good crop of flowers stand them outside during the summer months so as to ripen the growth. If this is omitted the result will be a lack of flowers.—J. T.

— **EUONYMUS EUROPEUS.**—This is one of the most useful and beautiful of hardy shrubs during the autumn months, the pendulous branches of which are then completely studded with capsules of a very attractive rose-magenta colour. The habit of growth is light and graceful, so that when cut the branches are well adapted for arranging in glasses, baskets, or vases. They should be arranged somewhat loosely to show to the best advantage. This shrub is of very easy culture, and will succeed admirably in dry stony positions, and on steep banks where few other kinds thrive. We have one growing out of the cleft trunk of an old Cedar tree. Propagation is easily effected by inserting well ripened shoots in the open ground at the present time, or by sowing seeds early in spring.—H. DUNKIN.

— **SCHEDULE SCAMPING.**—With the winter season upon us once more, societies in different parts of the country will be reviewing the work of the past season and preparing for the next. Committees will be at work on show arrangements, and schedules will be prepared. So far as the latter work is concerned it is too often seamed in a most reprehensible manner. Once drawn up and printed the schedule is taken as perfect, and passed season after season without the slightest revision. This is done in many cases, even when complaints and misunderstandings have been rife. A great mistake is thus made. The schedules should be gone over carefully every year and revised, so as to keep them up with the times, and so as to remove all reasonable cause for unpleasantness. If this were done all round the wheels of show machinery would run with far less friction than they now do.

— **HORTICULTURAL CHEMISTRY.**—The first of a series of four lectures on the chemistry of plants was delivered on November 23rd by Professor Ivison Macadam at the Surgeons' Hall, Edinburgh. The lectures form part of a scheme for technical education in horticulture which has been organised by the Scottish Horticultural Society, by the aid of a portion of the residue grant handed over to them by the Edinburgh Town Council for this purpose. There was a good attendance at the lecture alluded to. Mr. W. M. Welsh, President of the Society, in introducing the lecturer, commented with satisfaction on the largeness of the audience as justifying the institution of this course of lectures by the Society. Professor Macadam first showed that plants could be divided into a portion which was combustible and volatile, and into an ash or saline portion. The combustible and volatile portion partly consisted of water and partly of various and often of very complex substances, built up from the elementary or simple bodies—carbon, hydrogen, oxygen, and nitrogen. The ash or saline matter was obtained mostly from the soil, whilst the organic or combustible portion was in origin partly derived from the soil, but also to a considerable extent from the atmosphere. The various proportions of these proximate constituents were then given, and it was shown that not only did the ingredients vary in different classes of plants, but that they varied also at different stages of growth. It was also shown that the ingredients

varied greatly in the various parts of the plant. The lecturer then showed the properties of the more common ash constituents, and illustrated his remarks by experiments and diagrams.

— **THE OPENING OF KEW GARDENS.**—A deputation from the Town Council of Richmond waited upon Mr. Shaw Lefevre, First Commissioner of Works, on Tuesday last to urge that Kew Gardens should be thrown open to the public at an earlier hour than twelve o'clock on week days. Accompanying the first Commissioner were Mr. W. T. T. Dyer, Director of the Royal Gardens, and Mr. H. W. Primrose, Secretary to the Office of Works. The object of the deputation having been expressed Mr. Shaw Lefevre, in reply, said the question of the earlier opening of Kew Gardens was an old story, and not altogether free from difficulty. In 1883, as First Commissioner, he went into the subject, and with some difficulty persuaded the Treasury to sanction the expenditure of some £200 or £300 for opening the Gardens at twelve instead of one o'clock, and the Treasury, in giving their sanction, sent a minute to the Department, giving their reasons for so doing, but warning them that they thought the interests of the public generally must be considered in future rather than those of the neighbourhood. He had recently been further considering the matter, and he had referred the question of expense to a Committee which was now sitting investigating the question of the labourers' wages at Kew and the Royal parks generally, and until he knew accurately what the real cost of the arrangement which the deputation suggested would be he could not come to a final determination. He disputed the statement that not much watching would be required in the Gardens in the early morning in consequence of the paucity of the number of people, for the Director assured him that it was just when there were few people about that most watching was required. When large numbers of people were about they watched one another, and the danger to the valuable collections was when there were a few people. It must also be borne in mind that there was a great interest in the other direction—namely, that of the scientific men who were allowed the privilege of frequenting the Gardens in the morning, and Sir Joseph Hooker, the then Director, reported very strongly a few years ago against that privilege being withdrawn. A large number of persons now availed themselves of that regulation, and he had received letters from gentlemen interested in the Gardens objecting to the withdrawal of the privilege by the general admission of the public, and stating that it was of great importance in the interest of science that scientists should still have special opportunities of studying the plants.

HOYA IMPERIALIS.

ALTHOUGH introduced in 1847 the above plant does not seem to be so generally well known as are some of its congeners. It appears to vary considerably in character, for it is seldom that such a magnificent form of it is seen in gardens as that exhibited by Mr. F. W. Moore, Glasnevin Botanic Gardens, Dublin, at the Drill Hall, on November 1st. The specimen shown, from which our illustration (fig. 64) was prepared, had an umbel of fifteen flowers, of a bold distinct character, which doubtless secured the first-class certificate awarded. The flowers are of a reddish purple and cream colour, and have a wax-like varnished appearance. It is a beautiful stove plant, and should be more frequently seen.

MANURING OLD ORCHARDS.

THE graphic account given on page 414 of the *Journal of Horticulture* of the latest novelty in the Lord Mayor's procession, has doubtless been read with great interest and satisfaction by fruit growers throughout Britain, because it is an unmistakeable sign that the importance of fruit-growing as a home industry is now fully recognised. With so many splendid young fruit plantations springing up in various quarters, and such a sterling and comprehensive work as the "Fruit Growers' Guide" to show in a clear and thoroughly practical manner what to do and what not to do, there is every prospect that England will in the future grow, not only an enormously increased quantity of hardy fruits, but that the produce will also be immensely improved in quality.

Readers may naturally be led to think, But what has the foregoing to do with the work of manuring old orchards? This much: The remarks already commented upon brought back to my mind visions of some of the oldest and most extensive orchards in this country, among which I spent the years of early life. Many of these were sent to ruin and decay before their time by starvation. There seemed to have been no distinction drawn between the requirements of young trees which had nothing to weaken

them in the shape of heavy crops of fruit, and older ones which had for years been bearing enormous crops till the soil had become so thoroughly impoverished as to be totally unable to afford such trees the food necessary for the production of fruit of

ripened wood is obtained, good crops of fruit will assuredly follow if the weather is favourable at blossoming time; and whenever good crops are obtained liberal dressings of manure should follow in order to return to the soil, to some extent, the constituents

FIG. 61.—HOYA IMPERIALIS.

good quality, or even to prevent the trees passing to premature decay. Manure and over-rich soil have, in innumerable instances, been the cause of delaying the productiveness of many kinds of fruit trees; but when short-jointed, thinly disposed, and well

which have been drawn from it. This will keep the roots near the surface, make them active and healthy, and being within reach of the influence of air and sunshine they are more beneficially acted upon by the warmth of spring and summer, the fruits swell

quickly without a check, and become tender, juicy, and full flavoured.

When we consider the large amount of nutriment drawn from the soil in a single season by fruit trees carrying good crops, it is a matter for some surprise that inferiority in produce and early decay of the trees do not begin even sooner. This, doubtless, would be the case were it not for the fact that Nature sometimes recuperates herself by the trees failing to bear for a season or two. Some of the most productive among old orchards in Kent that have come under my notice are those which are continually grazed with stock. It is, I maintain, within the reach of all to increase the fertility of their orchards by applying natural or artificial manures. Stable or farmyard manure is without doubt valuable to use as a dressing for orchards as well as garden crops, possessing as it does a well blended combination of nitrates and phosphates. Being, however, not very rich in potash, a dressing of wood ashes or burnt refuse given in conjunction with it is of material assistance in supplying the necessary food.

In one respect we are placed in circumstances far more favourable than many gardeners, having abundance of stable manure at our command, as well as a plentiful supply of liquid manure obtained from the drainings of the stables, and collected in a large tank, while a heterogeneous mass of garden rubbish is being continually converted into burnt refuse. These materials we are now engaged in carting to an old orchard. The surface of the grass is first sprinkled with the burnt refuse, then a good dressing of stable manure is given at the rate of 25 tons per acre. By attending to this kind of work during the autumn months the heavy rains wash the enriching properties of the manure down to the roots of the trees and impregnate the soil with them, which practically means that so much stored up food is available for the trees by the time the roots are in the right condition to take it up, and the leaves to assimilate it. Other fruit trees will receive plentiful supplies of liquid manure from the tank previously spoken of; in fact, whenever similar tanks require emptying, whether it be during winter or summer, the rich fertilising liquid so easily obtained will be poured around fruit trees of all descriptions. If such treatment had a few years ago been given to many old orchards, in conjunction with a thinning of the branches, the trees would not now present the sorry plight they do. Let not readers suppose that I am advocating the renovation of old orchards where it would be wiser policy to plant young ones; I have treated rather of trees which bear only crops of small uninviting looking fruit, although the varieties are good and the trees themselves are neither too old nor too unhealthy to be profitable. In such instances a vast improvement may be wrought by working on the lines indicated. Trees so treated will then afford useful fruit while newly planted ones are becoming established, and it seems unlikely that the present generation, or future ones, will again allow the fruit orchards of Britain to lapse into a state of poverty and decay, either through want of knowledge or lack of energy.—LABOR OMNIA VINCIT.

PAST AND PRESENT IN THE NURSERIES.

A CALL AT LOW'S.

PROBABLY there are at least some members of the younger school of horticulturists who share my respect for old institutions. Dr. Brown Séquard notwithstanding, we have no other vessel from which to quaff the waters of the fountain of youth than wholesome and healthy lives. Decay is a law as immutable as the counter law of development, and the tendency to decline affects business houses as well as men. They have their growth, apogee, and fall. But there are some which gain strength with age, sending out fresh shoots and fibres because grounded on a strong foundation, managed with skill, and nourished by just methods. There is dignity about them, for the confidence they enjoy has been earned by the good work of more than one lifetime, and it should not be forgotten that in the changes necessary to adapt material and methods to ever-changing fashions there is a task more difficult of adjustment than the starting of a new venture to fit the special moment that sees its birth. If these changes be not conducted in the right way and at the right moment decline commences; if they be effected with comprehensiveness and promptitude the old house keeps abreast and even ahead of its rivals. No better example of this could be pointed to in the world of gardening than the North London firm of Hugh Low & Sons. Here we have a great trade institution founded three generations ago which has gone on growing years after its early rivals have decayed, and which, instead of mouldering in senile decrepitude, is full of the vigour of youth, with conveniences that extend and a business that grows season after season. It will give an idea of with what consummate skill the sails of this great trade ship have been spread to suit the varying breezes to point out that as it was a great house years ago when Cape and New Holland plants were popular, so it is a great house now that Orchids rule the destinies of horticulture. At the old Clapton Nursery nearly a hundred large houses shelter the large and choice collection of plants, including Orchids, there grown, and they are supplemented by vast ranges of pits, while at Bush Hill

Park there must be sixty or seventy more houses, and also about fifty acres of fruit trees and Roses. The latter nursery was founded a few years ago, when more space was imperatively demanded by the spreading of the old tree's branches. To the few remaining veterans who knew Low's in its early days a visit now would do more than revive old memories; it would show the wisdom of adaptability to the needs of the passing hour.

ORCHIDS.

Rarely is so splendidly grown a collection of Orchids met with as that at Clapton. No one could fail to note the enormous number and fine condition of many popular kinds as well as rarer forms. Such favourite Dendrobes as crassinode, Wardianum, nobile, Parishii, thyrsoflorum, Devonianum, and Pierardi are abundantly represented, while the remnants of a large batch of *formosum giganteum* lend welcome brightness at a dull period of the year. A large house nearly full of *Angræcum sesquipedale* in splendid condition constitutes one of the best collections of this beautiful Orchid in cultivation. *Phalænopsis*, so troublesome to many growers, flourish in great numbers, and are in the rudest health. There is a large houseful of *Veitchiana*, *Schilleriana*, and *Luddemanniana* just coming on. They are pinched so as to throw the flowering over until January or February with the object of escaping the worst of the fogs, which otherwise would work terrible havoc. In another house is a healthy piece of the white *Schilleriana*, a most valuable plant. *Cypripediums* have the attention that their importance merits, and many fine species and forms are observable. *Volonteanum*, *Crossianum*, *Harrisianum*, *Elliottianum*, *Sanderianum*, *callosum*, and *Spicerianum* are largely grown. So are *Leeanum* and its varieties, of which *claptonense* is one of the freest and best. *Leeanum superbum* and the lovely form *Lowi* are also beautiful. *C. Chamberlainianum* is in bloom with many others; *C. insigne Mooreana*, with light brown sepals and petals; *C. Heynholdiana*, which differs from *Lowi* in its spotted dorsal sepal; *C. Sedeni candidulum*, *C. cardinale*, and *C. calorum* are all worth noting. But most remarkable of all is a splendid house 80 feet long of *C. bellatulum*, of which, notwithstanding that it is a spring bloomer, there are many flowers open. The plants are growing like Cabbages, and as full of handsome foliage as well-grown Cyclamens. A house of *Cattleya Mossiae* 156 feet long awakens impressions of what it must be like when the plants are in the full glory of summer bloom; 1000 flower spikes open at one time form a display of marvellous beauty. *Epidendrum ciliare*, with green sepals and petals and fringed lip, grows like a weed. *Oncidium ornithorhynchum* and the violet-scented *On. tigrinum* are both noteworthy. One side of a house 160 feet long is solely occupied by a splendid importation of the Pacho type of *Odontoglossum crispum*. There is also a very fine collection of imported *Od. Roezlii*. *Vanda Amesiana*, with its delicious Gardenia-like smell; and *V. cœrulea*, of which there is a grand stock, are in bloom. Very striking, too, is *V. Kimballiana*, although not in bloom. The collection of this lovely Orchid is a very large one, and the plants are in superb condition. *Restrepia Leopoldi* and *striata*, *Cattleya superba splendens* Rio Negro variety, the true *Angræcum Ellisi*, and a piece of Chantini's original plant of *Cypripedium insigne* Chantini are of special interest. In short, there is abundance of material at Low's to satisfy all types of Orchid growers, and even at this the dull season, when flowers are comparatively few, the enormous collection has much to arrest attention. The best culture is observable in every one of the many houses devoted to Orchids.

PALMS.

More wonderful than the Orchids, in one sense, are the Palms. They are grown by hundreds of thousands, and the houses devoted to them would form a large nursery in themselves. There can be few places, one would imagine, in which Palms are grown on so colossal a scale as they are at Low's, and the plants are in perfect condition. *Latania borbonica*, *Kentia Belmoreana*, *K. Forsteriana*, *Geonoma gracilis*, *G. Schottii*, *Cocos Weddelliana*, *Areca lutescens*, and different *Phoenixes* are amongst the most largely represented, and the long houses crammed with them are enough to make any visitor wonder where the plants all go to. They are not marketed, but are disposed of through the usual business channels. The demand must be altogether in excess of the highest estimate that the non-professional or rather non-trading person would estimate, and this is a very gratifying sign.

OTHER FOLIAGE PLANTS.

Crotons and *Dracenas* hardly need mentioning, for it would naturally be expected that they would be largely represented. They are, and they are in splendid condition. Then there are large quantities of *Pandanus utilis*, also of *Asparagus plumosus* and *ranus*. *Araucaria excelsa*, too, is grown in thousands. The stock of *Aralia Sieboldi* appears large enough to supply the whole country, and the same might be said of *Aspidistra lurida variegata*. The latter is chiefly grown at the Bush Hill Park Nursery, where, too, there are several houses full of India-rubber plants and a magnificent stock of *Ficus elastica variegata*. The plants of the latter are models of health and beauty. In every case, and in that of numerous plants that are not mentioned, health and cleanliness are unexceptionable. Taken all in all the stock of foliage plants is one of the wonders of this extraordinary establishment, which has grown with time until it has attained gigantic dimensions.

HARD-WOODED PLANTS.

To the horticulturist of twenty-five years ago and more the collection of hard-wooded plants at Low's would awaken recollections of the

former popularity of this beautiful, but now neglected, class. There is still a splendid display of them, and in noting the number of houses and pits full of plants it would be easy to imagine that a revival had sprung up. A fine house of Epacris at Clapton is noteworthy in itself, but far more so are the long ranges of pits full of Heaths. The plants are propagated from cuttings by thousands without the slightest trouble, and are in all stages, some 3 or 4 inches high and as much through; others of flowering size. All are the picture of health. They grow with the greatest freedom, so thoroughly have all their wants and peculiarities been taught by the experience of years. At Bush Hill Park there are great houses full of plants in bloom. *E. ventricosa*, *E. hycmalis*, and *E. melanthera* are a trio that are grown in thousands. Acacias are another remarkable feature, the beautiful and easily managed Drummondii being one of the most largely grown. Then there are Chorozemas, of which Lowi is very much in evidence; *Genetyllis tulipifera* in large quantities; *Pimeleas*, *Boronias*, such as *heterophylla*, *elatior*, and *megastigma*; *Aphelexis*, and many others. *Correas magnifica*, *picta superba*, *Brilliant* and *cardinalis* also form a beautiful display.

Other plants can only have a passing reference to indicate the scale on which they are grown. There are thirteen long pits full of English grown Azaleas at Clapton, splendid plants all of them. Of *Genistas* there are several more, together with houses at Bush Hill Park. There are *Gardenias* in enormous numbers, all glistening with health. *Cyclamens* form a little nursery of their own, for there are ten large houses full of beautiful plants. Berried *Solanums*, *Bouvardias*, *Camellias*, and *Daphnes* are grown in thousands, while pot Roses are another nursery in themselves.

ROSES AND FRUIT TREES.

The wonders of the glass houses at Bush Hill Park do not exhaust the interest of the nursery, for, as mentioned above, there are 50 acres of fruit trees and Roses. The dwarf Roses for sale are a magnificent collection, being fine healthy plants full of vigour. Besides them there are 120,000 budded this season, and thousands of cuttings for own-root plants have recently been put in. Apples and Pears in all the popular varieties are represented by splendid trees in all stages. One piece of budded Apples, comprising 25,000, is very striking. There are fine quarters of standard trained Peaches and Cherries, also of espaliers and pyramid Pears, while two-year-old Apples have all the vigour and substance of trees at least a year older. Vines are another strong feature. Want of space forbids any further enumeration. Let it suffice to say that everything bears the impress of high culture. That is the great secret of success everywhere, and in the case of Low's it has undoubtedly had a large share in the enormous magnitude of their trade.—W. P. W.

THE BLUE TIT AND FRUIT BUDS.

I READ with much pleasure in your last issue Mr. Hiam's defence of the blue tit. Notes from such an observant naturalist are valuable, and I know of few men who take so much pains to verify their statements as my friend of "The Wren's Nest." The blue tit is one of the gardener's best friends. In the winter he is busy among the fruit and other trees searching for the ova of insects. Now above, now swinging under the branches, here, there, up and down, with quick action he peers into every crack and cranny, not only for the ova, but also for the dormant insects. Many a time have I watched these birds through a glass and seen how dexterously they with their sharp-pointed beak clear out the fruit-tree pests, and thus I have benefited by their work. What millions of insects and ova these little creatures must destroy in the winter months, and what "a blight" there would often be in the spring were it not for them. A few weeks ago I watched a party of these beautiful birds among some large Thistles (commonly called the Scotch), and I was delighted to find they were feeding off the seeds, and for two days then they were swarming about the Thistle heads until "food there was none." This was new to me, though I have been a field naturalist all my life. Goldfinches I have often seen thus employed, but never blue tits, but I have cole tits. True, when the weather is very dry and food scarce these blue tits will sometimes peck holes in Pears, &c., but that oftener is very far outweighed by the vast amount of good they do. Both the cole and the marsh tit are of much service, and I am glad to see all in my garden frequently.

I quite agree with Mr. Hiam, and that without any reservation, that the bullfinch and the sparrow are birds not wanted in or about our orchards, fruit trees, or gardens. I have watched these for more than half a century, and beautiful as I think the bullfinch is, and interesting in many ways, I would not have one about, or a sparrow either, if I could help it. Both have tried my patience even beyond endurance, and if more people would only note the true habits of birds as closely and as carefully as Mr. Hiam we would not be so often troubled with assertions about bird life that are scarcely founded so much upon fact as sympathy; and yet no one can say but what Mr. Hiam, and I will also include myself, has and have a delight and continued pleasure, nay even a love, for birds. Neither of us speaks because we would destroy simply. Truth must stand, however it may be denied. The bullfinch and sparrow are pests.—HARRISON WEIR.

I OBSERVE Mr. J. Hiam, Astwood Bank, is of the opinion that the above birds do not injure fruit buds nor kill bees. *Parus minor* is not so destructive to living bees as *Parus major*, but while plenty of dead ones are about contents itself with them. This, however, does not prevent it catching living ones, both during winter and while

feeding its young. In a very short time one bird will destroy all the buds of a fair-sized Currant or Gooseberry bush, and if several are about they will attack a Plum tree, and not leave it until but few buds remain. Sparrows do the same, and, like the tits, have virtues as well as vices. For the former substitutes can be found, but the latter cannot be overcome without great expense. *Parus major* is very destructive on living bees, but less so on bush buds than *Parus minor*. It is, however, too mischievous in that respect to be tolerated. It also attacks buds of other fruit trees the lesser one does not interfere with.—W. T.

YOUR correspondent, Mr. Hiam (page 459) inquires for the experience of other readers on the above. My experience is that both "A Lanarkshire Bee-keeper" and Mr. Hiam are right so far—namely, that titmice in the winter and early spring are very fond of bees when other food is scarce, particularly the large oxeye tits. I have watched them picking the bees to pieces, and have seen the snow sprinkled with the remains of the bees after they have been feeding. They will even tap the hive, woodpecker fashion, for the bees to come out to their destruction. I have a good many hives of bees and a large number of fruit trees, and I quite agree with Mr. Hiam that titmice do not eat fruit buds. I have many times watched them, and found it was insects they were in search of, but they have a nasty habit of pecking Pears near the footstalk in the autumn, causing them to decay; and they are certainly fond of late Peas in October. To my mind the only bird that destroys fruit buds in rural districts is the bullfinch, and if you want fruit where they are numerous they must be destroyed.—R. MAHER, *Yattendon Court*.

VINE LEAVES AND LATERALS.

I AM pleased to see the name of Mr. D. Buchanan appear in the *Journal* again, especially in connection with this subject, as I am aware of the varied experience he has obtained in the Grape-growing establishments of Scotland. That he is doing good work in the Forth Vineyard is made very clear to my mind by the description given of the brightly coloured leaves in the large vinery there. My opinion is that beautifully tinted leaves are a sure indication that the Vines carrying them are in excellent health, full of activity at the roots, and that the house management is such as to secure a gradual and natural ripening of the foliage. Unhealthy Vines sometimes during the growing season produce pale green or even yellow leaves. This may be in consequence of the soil being deficient in those constituents which supply chlorophyll to the leaves, or because through other causes the roots are not active enough to extract a sufficient quantity from the soil when it is present. Some might argue from this that beautifully tinted leaves were a sign of unhealthy Vines, but they should remember that the gradual change in the colour of foliage in autumn is due to a diminishing flow of sap which takes place *after* the leaves have performed their proper functions, not *before*, as in the case of yellow ones produced during the growing season. My opinion is that the beautiful colour in Vine leaves which Mr. Buchanan speaks of is not accounted for by the particular kind of soil in which the Vines are grown, so long as that soil is capable of producing good foliage and wood, but that they are the natural consequence of proper treatment. This opinion I think I can support with plenty of facts.

In the first place take as an example Vine leaves which have been badly infested with insects during any stage of their growth. Instead of turning yellow, bronze, or red, they assume a rusty brown colour as autumn approaches and shrivel prematurely, while the footstalk is left hanging to the Vine shoot, proving conclusively that the leaf tissue collapsed before its natural time; leafstalk and leaf should fall almost simultaneously. Next call to mind Vines which have been kept perfectly healthy up to the stage when the Grapes begin colouring. Moisture, with some cultivators, is then suddenly withheld, the atmosphere of the house being kept too hot and dry causes the leaves to lose their freshness and to become dry and brittle. Leaves on Vines so treated turn a rusty brown at the edges; they often have well coloured markings, but the colour is not vivid and they lack that glossy appearance which healthy leaves have quite up to the time of falling. Leaves such as those which I have described do not fall gradually, but come down in showers.

Contrast such leaves with those on Vines in perfect health, receiving good treatment and plenty of fresh air night and day while the Grapes are hanging. The colouring of the leaves then takes place gradually, there is a fresh glossiness in their appearance, they have no rusty brown edges which are brittle enough to crumble to pieces when pressed between the fingers, and even when they do fall they seem to do so reluctantly, one falling here and there, instead of coming down in showers. They fall simply because they have arrived at maturity, and having thoroughly performed their functions, the supply of sap, which has been gradually diminishing, at length practically ceases to flow.

In regard to the leaves sent by "J. L." and Mr. G. Nottage I doubt not that they were wonderfully fine samples, but it should not be forgotten that with the exception of Trebbiano, Gros Maroc produces the largest leaves of any Grape in cultivation.—H. DUNKIN.

THE identity of correspondents has little to do with honest discussion, so passing on to Mr. Dunkin's third sentence (page 433) I make bold to say every reader will agree with its truth—"The test of experience is displayed in the results achieved." I think Mr. Dunkin

has yet to explain the nature of his experience in Grape growing at Warwick Castle, and I suspect that Mr. Ward grew good Grapes before he saw Mr. Dunkin, and no doubt will do so now that he has left him. If Mr. Dunkin can invite me, through the Editor, to join Mr. Iggulden in the inspection of his produce, I will, in return, invite both to view mine, and entertain them with the greatest of pleasure. They will see we follow no rule-of-thumb practice, but we have some Grapes left, and Peaches have turned the scale at 10 ozs. Has Mr. Dunkin yet told us all he knows about Grape growing at Warwick Castle? I trow not.—WARWICK.

[We think the time has arrived for Mr. Dunkin to tell the public what he told us at the commencement of the discussion. He seems to have purposely left an opening for critics, and can now carry out his original attention.]

ROCKERIES AND ROCK PLANTS.

IN reference to your note on page 214 anent the presentation of rock plants to the Royal Horticultural Society by the Kew authorities, I am glad to see that public taste is still turning in this direction. I am sure that no class of plants give so much pleasure to people who appreciate hardy flowers as those which are suitable for the rockery. They are even more interesting and useful for making a display in a limited space than those which are confined to the border as herbaceous plants for the reason that they do not require nearly so much attention in the matter of staking and keeping the ground clear of weeds. I fear gardeners in general do not pay so much attention to this class of plants, or, indeed, to hardy plants in general, as they might and ought; but probably the day is not far distant when they will find it imperative to do so. In conversation with specialists who are large and frequent exhibitors at exhibitions held at various times of the year I have been told how little notice the average gardener appears to take of such collections, while those who do are always on the look out for anything new or rare, or improvements on older forms in any way. More than once I have been told by those in charge how amusing it is to hear the names which are sometimes given by gardeners to simple and common plants when inspecting the collections.

It is surprising what a number of varieties can be accommodated on a small rockery by a proper method of planting and attention. I know that in many gardens there is not the slightest semblance of a rockery, nor even perhaps a suitable place for one, but one can generally be found if two persons, employer and gardener, are in the right mood. It is not necessary that a costly arrangement should be undertaken in making an interesting rockery, provided that there be stone on or near the place; but where suitable material is not to be had for some hundreds of miles it is different. It is not necessary either that elaborate details of arrangements should be carried out before the stones are placed ready for the plants. The main object should be to provide all available space for plants rather than what is sometimes termed "artistic grouping" (?), for after all, how much of the artist's handiwork is seen after the plants are firmly established? The bulk of the stones are hidden, or they should be, by suitable creeping plants. Who would think of exposing a considerable part of overhanging stones, and do without such effective and interesting plants as *Arenaria balearica*, *Aubrietia Campbelli*, or some of the Mossy Saxifrages? The arrangement which provides the greatest amount of surface planting room is that which meets with most favour amongst plant lovers, if not amongst professional rockery builders.

Everyone having a particle of experience of rock plants prefers the natural stone, even if it be but flint, to that which is got up as imitations and composed of broken bricks, clinkers, or flint stones broken into small pieces, the whole being faced with cement. For years after being built it is difficult to coax anything to live on the latter, even *Herniaria glabra* has refused to associate itself with the sham-built rock and has preferred death. Some chemical influence connected with the cement is, I presume, the cause of the non-growth of plants which come into touch with it. The rockery which is fully exposed to the sun all day is not in the best site for successfully growing the greatest number of plants. That which is situated on the north side of trees giving some shade, but which are far enough away to prevent dense shading is better. The north side of the rockery should not be wholly exposed to the full blast of biting winds from that quarter and the east, although plants which are subjected to a little of such conditions are more reliable than those which are huddled up in an oven-like situation. Rockeries should be made longer than they are wide, and are better if running east and west. The northern side provides an opportunity for the growth of plants which object to the glaring sun, such as *Ramondia pyrenaica*, for instance, and the Ladies' Slipper Orchids, also *Trillium grandiflorum*. For the purpose of comparison, classification, and effect, all families, such as Anemones, Saxifrages, and dwarf Campanulas ought to be massed together. This is much better than the "higgledy piggledy" system sometimes adopted.

Such plants as the Gentian family can be managed successfully if they are planted on the sunny side of a block, although many persons fail to grow *G. acaulis* to perfection. I have been fortunate enough to obtain as many as twenty-seven fully expanded blooms of this variety on a patch 12 inches square; it was a veritable sheet of blue, and the flowers remained in perfection a long time. A thin soil, composed of loam and old lime rubble, is all that is required, but the great point is to provide water at the roots in quantity while new growth is being made after flowering is past. During very hot weather some shade is essential;

I afford that by laying a few common Laurel twigs on the top of the plants, removing them at night and during dull or wet weather. Where the roots are burnt up by powerful sun and no water is given it is not to be wondered at if this plant refuses to succeed. I mention these facts to show that to be successful with all rockery plants it is something more than a question of simply planting them and expecting them to grow and flourish. Another instance of a "miffy" plant under ordinary treatment is that magnificent blue-flowering perennial *Lithospermum prostratum*, which almost rivals the Gentian in intensity of colour under satisfactory conditions; or take again the brilliantly coloured Californian *Fuchsia*, *Zauchneria californica*, which will grow like a weed where the conditions are favourable.

Rockeries should not be limited to strictly rockery plants, but with a view to make them interesting over a longer season such plants as *Spiraea callosa alba*, *S. brumalda*, various low growing Heaths, and *Hypericum caprifolium*, which is attractive both in flower and when bearing fruit, should be added. Even bulbous plants go a long way to embellish the rockery. What could be more effective early in January than a clump of *Galanthus Elwesii*, with from 100 to 200 blooms expanded at once? It may be followed by various *Narcissi*, *Scillas*, and *Chionodoxa Luciliae*. I could give a list of suitable plants for rockeries to bloom at various periods as a guide to intending planters, with a note on their peculiarities of growth if any, but fear the Editor is thinking I have already said enough.—E. MOLYNEUX.

JOTTINGS ABOUT FLOWER BEDS.

MR. DUNKIN says, in the *Journal of Horticulture* for February 25th of the current year, that he is strongly in favour of using old Zonal Pelargoniums. I am of the same opinion, so much so that I have followed a system of my own since I came here over seven years ago, and which has proved in every way a success. I lift all my Pelargoniums, which are in pots, the first or second week in October, and place them in a vinery that is started about February 1st. They receive no water, unless they are inclined to shrivel, until February 1st. They are then cut down to one eye on each shoot, and syringed daily until they break. When they have started into growth freely all the soil is shaken from the roots, and if there are any very strong roots they are shortened back. The plants are then potted into the same sized pots. The soil I use is what Chrysanthemums have been grown in, and this is rubbed through a coarse sieve; the pieces of sods and bone dust that have been used form a lasting compost for the Pelargoniums. The plants are placed back in the vinery until growth has fairly commenced, and then they are removed to a Peach house, started about March 1st. They remain in this house until severe frosts are passed, and then put into cold frames. They are planted or plunged in the beds the first week in June, so close that no soil can be seen. They are in bloom when planted, and continue so until October. The plants being put in the beds in the pots prevents them making too much growth in a wet season.—T. C., Leeds.

AN ATTRACTIVE FLOWER BED.

BEFORE the useful jottings on this subject, which have appeared lately in the *Journal* are finished, I should like to add a short note on a combination which is admirably suited for filling large beds in prominent situations, such as the centre bed in a large flower garden. This is a mixture of *Lobelia cardinalis* and *Calceolaria amplexicaulis*; the bright red flowers of the *Lobelia* and the lemon yellow *Calceolaria* blend admirably together. The *Lobelia* should be planted in small clumps over the bed at about 18 inches apart, and the *Calceolarias* dotted amongst them. When the latter have made good growth peg them evenly over the surface of the bed, and it is advisable to support their flower stems with neat stakes. When cut down by frost the *Lobelia* roots should be lifted and placed thickly in boxes, wintering them in some light position where frost alone is excluded. The *Calceolaria* mentioned is more tender than the other bedding varieties, and is best preserved during the winter in boxes, treating the plants the same as bedding Zonal Pelargoniums. Plant into rich soil outside when all danger from severe frost is over.—O. C.

ANTIRRHINUMS FOR BEDDING.

IN the near future this class of plants will play a prominent part in the embellishment of our gardens during the summer and autumn months now that distinct colours can be obtained true by propagation from cuttings. In some instances they come very well from seed, but propagation from cuttings is the most satisfactory way of obtaining a true stock. Although the striped kinds may be novel in point of colouring, I prefer the self colours, which can be employed so much more in harmony with other things in the garden than can the striped varieties.

As late as the middle of October we had some hundreds of plants of an exceptionally fine type of a white-flowered kind, which were smothered with blossom, and had been since the end of May, with one exception during a long spell of dry weather, which in addition to the plants growing at the foot of a Holly hedge, gave them a check. The mention of their being in flower at that period is made to show what a length of time *Antirrhinums* can be had in bloom. In addition to the white above named I have a splendid soft yellow and three shades of dark coloured sorts, in all five distinct colours, which if judiciously employed can be made to give a good display next year. *Antirrhinums*

grow so freely, and give so little trouble that the wonder is to me that they have not been more numerous employed in the embellishment of our gardens.—E. MOLYNEUX.

THE CARNATION MAGGOT.

THIS pest seems to be getting very prevalent again this winter, for its work of destruction seems to be chiefly performed at this time of the year. Calling in at a Kingston garden the other day, where Carnations are largely grown, I found the gardener yet busy potting his rooted layers, and as he did so was searching for the maggot. In not a few cases the main stem or heart of the plant was already destroyed, in others the side shoots only had been eaten, and in some instances but a leaf or two. These were gathered, and the tiny depredators exposed to view. As evidence of the tenacity of life these insects possess, the gardener told me that he had put several into a saucer that contained pure paraffin for several hours, and that did not kill them. If that be so, it is evident that very drastic dressings indeed would be needful to kill the maggots. What seems obvious is that dressings in some form early in the autumn are needed to render the plants innocuous to the parent fly which deposits the eggs. That these are laid in the sheaths of the leaves there seems to be no doubt, as in nearly all cases the maggot is found at the base. Still my friend would have that sometimes the leaf was hurrowed or eaten from the point downwards, but howsoever the attackers commence, there can be no doubt whatever but that they are a source of exceeding trouble and annoyance. So far as I gather, plants grown under glass are not so affected, but if layers be so out in the open, and then potted, nothing seems able to save them.—D. K.

SHERBORNE CASTLE, DORSET.

IN the days of the old Potato exhibitions there was no more enthusiastic attendant and judge than Mr. Pragnell, of Sherborne Castle Gardens. How much he would have enjoyed the grand autumn show of Potatoes at Earl's Court I know full well, for I was enabled to visit Sherborne on October 1st, and learnt from him that he was still as enthusiastic over the noble tuber as ever.

Sherborne is situated in a lovely county, and the park attached to the castle is one of a delightful nature, for it is very undulating, is finely wooded, and has in it a lake of water that is of immense area, and adds exceeding beauty to the demesne. The present mansion, though just a little of castellated form, is not a castle, and is of somewhat Elizabethan architecture. The main portion or centre was, it seems, built by Sir Walter Raleigh, who found it a favourite residence, and near to the ruins of what is a very ancient castle. Situated on high ground beyond the lake there is not only a stone seat that was built by Raleigh for his own special enjoyment, but there is also a stone alcove called Pope's Seat, in which the poet of Queen Anne's time used to spend many of his pleasantest hours. The ruins of the castle naturally have great charm for the archaeologist, as also has the grand church or minster in the town, about half a mile distant, the foundations of which were probably laid some 1200 years ago. The present mansion has been enlarged by the addition of wings, and that too is situated on an eminence and is well sheltered by lofty trees, whilst from its chief fronts run away to the lake, broad if somewhat bare lawns or glades of grass.

The kitchen gardens are within easy distance from the mansion, and Mr. Pragnell resides on one side in a roomy house. Just before entering the park a number of varieties of *Crataegus*, planted in a triangular enclosure, attract attention. These were planted some forty years ago by Mr. Pragnell's father, and were supplied by the Messrs. Oshorne of Fulham. The collection is probably one of the best and most representative to be found outside of a nursery, and presented in many respects when I saw the trees, not only exceeding beauty in the berries, but also great variety. Bordering one of the roads that margin this group of Thorns are many very fine, and indeed beautiful, trees of what is probably *Fagus incisa*—at least, it is here termed the Fern-leaved Beech. A more beautiful avenue or bordering tree than this is—so pyramidal, dense, elegant, and leafy—could hardly be found. There is near the mansion one of the finest *Salishuria adiantifolia* to be found in the kingdom, for this noble tree is some 65 feet high, and it is well furnished. Cedars of Lebanon are about the grounds in very fine form; some of remarkably erect growth.

Mr. Pragnell has plenty of fine Grapes to show in his vineries, an entire house being devoted to Mrs. Pince's Black Muscat; it has a very fine crop, and richly coloured. It hangs well if needed till Christmas. Another house is devoted to Black Hamburgh Grapes, a third one to Muscat of Alexandria, a capital crop, and a further one to Lady Downe's, also in excellent condition. These are the chief Grapes grown here. The culture of Pines is still a feature here, fruiting and successional plants being in the best possible condition. Wall fruits have been good and plentiful, and trees generally are in good form. On some hard-pruned Apple trees in the kitchen garden King of the Pippins, Lord Burleigh, Adam's Pearmain, Scarlet Nonpareil, Egremont Russet, and some other good dessert sorts are carrying heavy crops. Lord Burleigh is in great favour for its excellent keeping qualities.

Very considerable quantities of Chinese Primulas are grown in numerous varieties, for Mr. Pragnell is fond of cross-fertilising these flowers, and has a capital selection. Cinerarias, too, are excellent. A very curious illustration of the capacity of what is usually esteemed a tender plant to adapt itself to adverse conditions is evidenced in *Ficus repens*, which, growing luxuriantly in a stove, forced some of its shoots

through loose joints in the door jambs, and spreading over the wall outside on a north aspect, where it grows as freely as inside. If such be the case may not this *Ficus* be absolutely hardy after all?

Tomatoes on a south wall—Laxton's Open Air, Acquisition, and others—were giving a heavy crop of fine fruit. Some spare frame lights stood in front were helping the fruit to ripen materially. The true stock of Pragnell's Exhibition Beet is still growing here. None other is grown or seeded, hence the stock does not become mixed. The day previous I saw at Longford Castle a remarkably true and refined stock of the Pineapple Beet, which seemed to be a long way better than are the samples seen in market gardens.—A. D.

TULBAGHIA VIOLACEA.

A PRETTY little hardy bulbous plant, which is far too seldom seen in gardens, is that represented in the woodcut (fig. 65). The name may be said to be the least recommendation possessed by the plant, for it is

FIG. 65.—TULBAGHIA VIOLACEA.

by no means euphonious, though the plant itself is both graceful and attractive, and should be more generally grown. The flowers are rich purple, and are borne in large umbels, which have a pleasing effect when intermixed with other hardy flowers. It succeeds in any light moderately rich soil, and requires no special attention in its cultivation.

NOTES ON GARDENS AND GARDEN MANAGEMENT.

[Abridged from a paper read at a meeting of the Ancient Society of York Florists by MR. H. J. CLAYTON.]

My subject appears to divide itself into two parts—viz., (1) Gardens and (2) Management. First as to gardens. I need not trespass on your time and attention as to the antiquity of gardens. The oldest and best book the world knows has proved this for all; our Ancient Florists' crest, too, gives us an allegorical picture of the first gardener and his wife. If time permitted I might refer to the gardens of ancient Greece and Rome, though the records we have do not go to prove that they were common, save in their larger cities. China has probably been the possessor of gardens in a general sense longer than any other country.

To come to our own land. We have to admit that gardens are comparatively of a modern character in the sense we understand them, though possibly the cultivation of small plots of land was more general

pro rata to the population at one period of our history than even now. However, I think most of you will agree with me in saying it is this our own period that has witnessed the great development of gardens in their higher scale. Various causes have brought this about. Steam and its concomitant extension of commerce having caused a greater accumulation of wealth as a whole, and also a greater dispersion of it among the whole population has given to more people the means of enjoying the pleasures and advantages to be derived from gardens. I venture to think and hope we are not yet at the end of our tether in this direction. There is yet room for more gardens both public and private. Speaking of public gardens I allude to those open to and supported by them. I think I hear some of my hearers say. Where is the money to come from? My reply is, Suppose a few hundreds of thousands of pounds which we now expend in other luxuries were gradually diverted into this channel, would the public suffer thereby? Without being at all pharasaical, I must say that the benefits to be derived by so doing are manifold. However closely the subject may be examined I can see nothing but good therefrom. As to private gardens I would include all kinds—front gardens, back gardens, window gardens, suburban gardens, and allotment gardens. Time will not allow me to enter largely into the question of exhibitions of all kinds in connection with gardens. Suffice it is to say they are of a nineteenth century creation so far as I know, and on the whole have done much to increase the pleasure, profit, and privilege to be derived from gardens.

GARDEN MANAGEMENT.

Here I am more at home, though the command given to the first gardener—viz., to “till it and dress it”—has to me a marvellous fecundity in it, and seems in a sense to cover the whole ground of management. What duty does a gardener execute in his garden to-day that cannot be brought under this command? Tilling may be said to include draining, digging, and every other operation for preparing the soil for the seed and plants of the expectant crops. To obtain these in a satisfactory manner the best seeds should be sown at the right time and in the right manner and medium. Dressing would include thinning the crops, keeping down what we term weeds, and reaping the produce.

Perhaps here may fitly come in a few remarks as to what is the best school for a youth who hopes some day to manage a garden. I should decidedly say a moderate sized garden from which good results are regularly obtained. It is not wise to be too anxious to get under a glass roof at once. Outdoor culture forms the base of all good gardening. Once learned it is not easily forgot. How many otherwise deserving young men, when describing the garden they are employed in, commence by telling of the outdoor garden? Is it not far more general to hear what glass there is and what more is about to be erected? I do not for one moment wish to speak lightly of what I may term the higher duties of a gardener—viz., under glass cultivation—I only want to prove that more men fail when appointed as garden managers by knowing less of the outdoor portion than the indoor one. I have heard of a gentleman saying, when inquiring for a new gardener, “Send me a man who can grow a regular supply of good vegetables. My garden literally smells of Pines, but I and my friends cannot live on them alone.” A notebook in which to record work done, and seen done, should be kept. It is well to have the right-hand page clear, for notes on the results of those on the left-hand one. Be sure and attend to details, they are the base of all sound knowledge. When changing situations endeavour to get into one where the practice is somewhat different from the one left. Read good books and papers bearing on your profession. They are more numerous, more instructively written, and much more easily obtained now than in former times.

After some ten years and upwards of varied experience will come the time for looking out for a garden to manage. The first charge is an important epoch in a gardener's life. He should take his bearings well, as besides those who employ him the eyes of his *confrères* will be upon his conduct and work. It is well to pay strict attention to the former especially. Never forget it is their means and in the main their time you are using. Do not be afraid ignorant people thinking you a mere servant. To my mind the motto “I serve” is a noble one, and worthy as a crest for the best of men. In every respect always be loyal to your employers. If you are found faithful in small things it will be a sure passport to further trust. In case you cannot conscientiously give this loyal service seek the first opportunity of securing another situation, but do not punish yourself in this way too much until you have used every fair effort. Of course there are some unreasonable employers as well as employed. As a rule the former do not get efficient servants for long, nor the latter succeed in life. Find out the wishes of your employers as to their requirements from the garden you are managing. Try and meet them. Aim at having all things under your care in as good condition as the means given will allow of. Do not get shipwrecked on the rock of wanting to exhibit the produce grown under your management if your employers object. In all probability they will allow you this privilege in due time if they find you faithful in your duties generally. I once heard an owner of a large garden say that the best exhibition table for a gardener was his employer's table, and his gardens and grounds. This may not be the whole truth of the matter, but there is, in my opinion, some wisdom in it; anyhow, there will always be sufficient who will allow their gardeners to exhibit their produce, so as to keep up the splendid horticultural exhibitions we now have all through the country. This is proved, I think, by their increasing numbers as years roll on. I mentioned the eyes of your

confrères would be upon you. Try to raise your work to the level of the very best of them. Above all things avoid the too frequent plan of insisting to your employers and others what a very ignorant man your predecessor was. To my mind this is the worst blot on the fair fame of gardeners as a body, who in many ways are noted for the sympathetic bond that runs through followers of our ancient craft.

Other gardens should be visited as opportunity occurs. Few observant men can walk round even the smallest garden without learning something, if only what to avoid. In your dealings with those under your management always try and secure their respect. This can best be done by steady consistent treatment all round. Never act as if the garden you are managing was especially made for your own autocratic will and pleasure. Of course, you are responsible for the results, and must have orders obeyed. As a rule respect will gain this end more surely than fear. Gardeners' positions are becoming more onerous in many ways; more is expected from them than at one time, and changing circumstances are tending to shorten the means of acquiring them in many places. A garden manager who has about him a loyal contented staff can make matters meet and tie much better than one who has a sullen disorganised one. One way of assisting in gaining the respect of those under you is to take a sympathetic interest in their general welfare. I have no wish to be egotistical when I say that all through my own twenty-seven years' experience as a garden manager this has been one of my most pleasant duties.

Be courteous and civil to all those about the place you reside in who may not have direct dealings with you. While taking every opportunity of giving a helping hand to them in any legitimate way do nothing that would commit you in your employer's eyes. Many otherwise good garden managers fail in their dealings with those about them. Always endeavour to produce from your charge as much profit, pleasure, and privilege as is possible, and I have no fear but that in due time you will receive your reward in the shape of a good conscience, a comfortable home, and the respect of those whose gardens you have to manage.

HEREFORD FRUIT SHOW.

ON Wednesday, November 23rd, a long felt want was supplied in the purely agricultural county of Herefordshire, in the establishment, under favourable circumstances and with pronounced success, of an Apple and Pear Exhibition, to which was seasonably coupled the now fashionable and universally grown Chrysanthemum. Not that this is the first effort in Hereford in this direction, for it will be in the pleasing recollection of many of the readers of the *Journal of Horticulture* how some years ago a series of fruit exhibitions were held under the auspices of the Woolhope Club, with a view (1st) to substitute in the place of the worthless varieties in the Herefordshire orchards really good marketable produce, and (2nd) to supply typical specimens for the magnificent work, the “Herefordshire Pomona.”

The former praiseworthy object, the Exhibition last week so successfully inaugurated, hopes to continue; indeed, it surpassed the expectations of even the most sanguine, no less than 3700 dishes being staged, every portion of the large Shire Hall being filled with plates of even, clean, and well-coloured specimens; in a year, too, when we recollect the proposed International Fruit Show was postponed owing to the bad prospects of a good season in the early spring, there can be but little doubt of the Exhibition becoming a regular institution.

Surely this should be the case in a county like Hereford with its deep and rich soil, capable of supplying all Great Britain with its 27,000 acres of orcharding if only properly planted and tended. Here a remark may be added as apposite, made at the Committee luncheon by the Vice-Chairman of the Hereford County Council, that august mouthpiece of the people, and one would like to think, with its power present and prospective, the friend of the landed interest, and all sorts and conditions of men: That tenant farmers (and I may add here that my remarks, as in the case of the Exhibition I report, lead up mainly to their interests) would do well to plant such good bearers and quality fruits as the Golden Winter Pearmain (the speaker called it Prince's Pippin), despatching the best to market (more Americans, presumably!) and keeping back the “cullings” for the mill.

Apropos of cider fruit, a new departure has been made in the schedule of prizes, the number of plates being wisely restricted to twelve, which were typically represented by ten small, pretty, mostly cherry-coloured specimens of useful varieties, not only pleasant to the eye of the on-looker, but prospectively good for a twin national beverage (as in the good old days of yore), in healthy rivalry with that kingly monopolist—Hops and beer; instead of, as previously, exhibited indefinitely in large numbers of crude many-sized unwholesome nondescripts, an eyesore on the plate to all the other surroundings, as well as, possibly, something more than a doctor's bill when transmogrified in the glass or tankard.

But to come to details. As a complete list of awards and prize-takers would tax the space allotted to this report as well as the patience of the general reader, I will only allude to a few of the chief features of the Exhibition. The first object to meet the eye was the first-prize card of Messrs. Bunyard, with their grand collection (Division A, open) of 100 plates of Apples. Viewed in that splendid light in our Shire Hall (many a rosarian will well remember), which not even these nebulous November days can quite quench, the general effect was charming, and well sustained the reputation of the firm and

the county of Kent in which they were grown. This season no fruit (those grown out of doors, and shown at Hereford, were handicapped, and rightly) were especially fine (the premier single Apple, Warner's King, and Pear Pitmaston Duchess, both being under 1 lb.), but for colour notably, and symmetry and smoothness the quality throughout this collection, and indeed throughout the entire Exhibition, was

wonderful.

The following varieties demand notice:—Bramley's Seedling is a heavy, good keeper, finely shown; Queen, large and fashionable, good for exhibition, but somewhat broad and coarse; Sandringham, princely in shape and of uniform size, but better for the exhibition table than elsewhere; Tyler's Seedling, brilliant colour and useful; Roundway Magnum Bonum, not very attractive, but a great and certain bearer, recommended; Stirling Castle, early culinary, very long season, difficult to beat, useful to tenant farmers for market; Court Pendu Plat, a good market Apple and great bearer; Gascoigne's Seedling, finely shown, good in colour, wants age to bear well; New Hawthornden, perhaps the largest plate staged, over 30 ozs., useful variety and recommended; and last but not least, colonial variety Bismarck, one of the most sought-after Apples of the day, grand in colour, and if allowed to hang long on the tree good for market purposes.

The collections of Pears really deserve no notice, being small in number, size and quality. The first prize was taken by the above firm. The fine collection of Pears from the Earl of Chesterfield's cordon wall, Holme Lacy, near Hereford, was much missed, and it was a leading feature in all previous exhibitions.

The second prize for 100 Apples fell to the Fruit and Rose Company, (Cranstons), with clean, smooth, but not so large fruit as came from Kent, but especially fine coloured specimens of Bismarck were shown. Their varieties of Nonpareil Apples were also numerous and well grown. Among amateurs Mr. Lee Campbell, Glewston Court, carried off most of the honours, but in some of the classes he was run very closely by Mr. Parker, gardener to Mrs. Evans, Moreton Court, Hereford, and Mr. J. Davies, Bodenham, near Leominster, and Mr. Joseph Pulley, Lower Eaton. Mr. John Watkins, Pomona Farm, Withington, near Hereford, though not a competitor, staged 270 plates of Apples second to none. One collection of the leading dessert Apples was also noticeable, the following being especially good:—Cox's Orange Pippin, Worcester Pearmain, Aromatic Russet, Wyken Pippin, Cornish Gilliflower, Duke of Devonshire, Improved Ashmead's Kernel, Gravenstein, and American Mother. Among the best culinary varieties in another group were Warner's King, with a deep red colour, most unusual with this generally extremely pale-skinned variety; New Hawthornden, also highly coloured; Peasgood's Nonesuch, very large; Potts' Seedling, Ecklinville, Cox's Pomona, Bismarck, Mère de Ménage, Beauty of Kent, King of the Pippins, and Blenheim Orange.

Special prizes were given by Messrs. H. P. Bulmer & Co., Mr. John Wathins, Mr. Charles Whiting, and Mr. John Wilson.

In Division F, open to all, prizes were given for the best packed basket, box, or barrel of culinary or dessert Apples for market, which met with the great interest the competition—which was very large—deserved. On the whole, as a first attempt the work was well done; still, the majority made the great and common mistake of placing their best specimens on the surface, while others packed their Apples on their sides. Mr. Rogers, Hereford, carried off the first prize, Mr. Phillips second, and Mr. Joseph Pullen third. The judging in this difficult class many of the public will be glad to hear was ably carried out by Mr. Grant, the great rosarian of old, who has quite recovered from his dangerous accident.

The other Judges were—Fruit, amateur and open classes, Mr. A. Barron, Chiswick, and Mr. Coleman, Eastnor Castle Gardens. Tenant farmers' classes, Mr. Sherlock, King's Acre Nurseries; and Mr. C. Whiting, Hereford. Cider and vintage fruit, Mr. E. F. Bulmer and Mr. Godwin, Hereford; and Mr. Piper, Ledbury. Chrysanthemums, Mr. Young, Abberley Hall; and Mr. Childs, Croome Court.—HEREFORDSHIRE INCUMBENT.

CHRYSANTHEMUM SHOWS.

HANLEY.—NOVEMBER 16TH AND 17TH.

THE tenth annual Show of this flourishing Society was held as usual in the Victoria Hall. This Exhibition is fast coming to the front, and does the Committee credit.

Groups of Chrysanthemums were a great feature. J. F. Maddock, Esq., Alsager, secured the leading prize in this class. Groups of plants arranged for effect were also well shown, Mr. P. Blair, Trentham, taking one of the two first prizes with a tasteful arrangement. The other first prize group exhibited by J. T. Harris, Esq., The Hayes, Stone (gardener, Mr. J. Bates), contained some very fine Calanthes. Specimen plants were well shown considering many of them are grown in a very smoky district. Messrs. Blair, J. T. Maddock and several others took first prizes.

Cut blooms were very strong this year, one of the leading growers, Mr. Bremmell, gardener at Overly, Wellington, Salop, coming out stronger here than at Birmingham, and taking all four first principal prizes in the open classes. His incurved blooms were well dressed and solid, Lord Alcester, John Lambert, and all the Queen family being splendid. In the Japanese section Vivian Morel was very fine. Messrs. Blair, Goodacre, and others took part in these classes.

Amateurs take a great pride here in making up wreaths, crosses, and buttonhole bouquets, ladies' sprays, and ladies' hand bouquets. These made quite a show in themselves. Messrs. Jenkinson, Newcastle, Pointon, and Miller secured the leading prizes in the open classes, and Messrs. W. Mass, P. Simpson, and J. Clark in the amateurs' classes.

Grapes were well shown. Mr. Harris, Stone, was first for black Grapes; Mr. Breeze, Congleton, second; and Mr. Gilman, Ingestre, third. In the class for white Grapes Mr. Breeze was first with some very fine Muscats; Mr. John Wilks, second, and Mr. Gilman, third.

All the amateur classes were well filled with good plants and cut blooms.

NEATH, SOUTH WALES.—NOVEMBER 17TH.

No Show being held in Swansea this year, Neath, about eight miles distant, is the only exhibition in that district, and although but the second attempt, the Committee and Secretary must be congratulated on producing a very fine display. It was held in the Gwyn Hall.

The cut blooms, as usual, were the greatest attraction. In the open class Miss Talbot, Penrice Castle, took the first prize with some very fine flowers. Among the incurved Lord Alcester, John Lambert, Queen of England, and Empress of India were very fine, with Vivian Morel in the Japanese. Second, the Earl of Lisburne. For twelve incurved, distinct, the Earl of Lisburne took the lead, Mr. Milner, gardener to Miss Talbot, taking second prize. For twelve Japanese, distinct, Miss Talbot was first with very fine blooms. Second, J. H. Rogers, Esq., Llanelly. Third, Earl of Lisburne.

For trained specimens, open to all, H. H. Price, Esq., Brynglas, and Mr. W. Farrant took the leading prizes with some very fair specimens, a great improvement on last year.

Amateur classes were strong and numerous. Messrs. G. Whittington, T. C. James, H. H. Price, J. F. Davies, M. Morgan, Ritson, G. Sims, and Mrs. Gwyne, being some of the principal prizetakers in these classes.

Groups of Chrysanthemums arranged for effect.—First, Mrs. Gwyne. Second, Mr. H. Price. Ladies' shoulder sprays were very pretty.—First, Mr. G. Davidson. Second, Mr. W. Farrant. Third, Mrs. Gwyne.

Mr. Milner had the best bloom in the Show, a good specimen of John Lambert. For best three blooms of Vivian Morel, J. H. Rogers, Esq., was first, and the Earl of Lisburne second. The Earl of Lisburne took first prize for three best blooms of Mrs. Clibran, a new incurved variety.

J. H. Rogers, Esq., Llanelly, took first for a collection of fruit, showing some good Grapes; second, Mrs. Palmer, Rehola. The trade exhibits of Messrs. Clibran, Manchester, Mr. Treseder, Cardiff, Mr. Farrant, Swansea, Messrs. Parsons & Co., of Swansea, Mr. John Lleyllyn, Neath, and Messrs. Morris Brothers, were very fine.

Collections of vegetables were very fine. Mr. Milner, Penrice Castle, staged two fine collections, taking first in the special and first in the Societies' classes. Mrs. Gwyne was second, and Mrs. Palmer, Rehola, third.

HEREFORD.

HELD in connection with the great Fruit Show (see page 490), the show of Chrysanthemums was of an average character, the date being somewhat too late to obtain fine blooms. "The best group of plants in pots arranged for effect," for which a five-guinea cup was offered, only brought forward two exhibitors, viz., With's Patent Plant Food Co. and J. Pulley, Esq. (gardener, Mr. William) the cup going to the former whose flowers were of good size and well grown. The following varieties were noteworthy: Louis Boehmer, E. Molyneux, Coronet, Avalanche, and Etoile de Lyon. The flowers in the second prize collection were much smaller but of better form, especially the incurved varieties.

The class for thirty-six blooms (eighteen incurved and eighteen Japanese) was well contested. Mr. R. W. D. Harley Brampton, Brian Castle, was placed first with particularly good blooms of Japanese: Avalanche, Boule d'Or, W. W. Coles, Madame Bernard, Stanstead White, Mdle. M. Hoste, Ralph Brocklebank, Etoile de Lyon, and Louis Boehmer; and of incurved, Queen of England, Lady Dorothy, Lord Alcester, John Doughty, Violet Tomlin, Golden Empress, Jardin des Plantes, Jeanne d'Arc, and others were good. C. Lee Campbell, Esq., obtained the second place, and With's Patent Plant Food Company third, with flowers much smaller but of good form.

In the class for twelve blooms of Japanese, open to Herefordshire only, the first prize was taken by W. J. Harley, Esq. The following were very fine: Vivian Morel, Madame Bernard, Ralph Brocklebank, Louis Boehmer, Stanstead White, Lilian Bird, and Boule d'Or. The second prize was adjudged to Joseph Pulley, Esq., who had some fine flowers of Etoile de Lyon, and Delaux. In the corresponding class for twelve incurved Mr. R. W. D. Harley was again successful, the blooms of Queen of England, Violet Tomlin, and John Lambert being very fine. Mr. J. Pulley was second, and the Right Hon. Lord Rodney third.

In the class for reflexed the first prize was awarded to With's Patent Plant Food Company with good flowers; and for Anemone flowered Mr. C. Lee Campbell was first. Plants in pots were scarcely so good as they might have been.

BARFORD.

UNDER the patronage of C. A. Smith-Ryland, Esq., a Chrysanthemum Show was held at Barford, near Warwick, on Wednesday, the 23rd inst. Owing to the lateness of the fixture the entries in some classes were not very numerous, but the quality throughout was very good, and the beginning made this year will doubtless develop into a fine annual Show. Mr. Dancer, gardener to Lady Guendlen Little,

secured the first prize for a group of Chrysanthemums, and also for a single specimen plant.

Mr. H. Dunkin, gardener to the Earl of Warwick, won the premier award in the cut bloom classes for twelve incurved, and also for a similar number of Japanese. The former were well moulded blooms, and the latter, though not particularly large, were fresh and finely coloured. Louis Boehmer, Etoile de Lyon, and W. W. Coles were the best among them. Mr. J. Garner, gardener to E. Cassell Esq., Compton Verney, was second in the same classes, as well as for six Japanese blooms. Mr. Finch, gardener to W. R. Mann, Esq., secured first honours for six Japanese, and also for the same number of incurved blooms.

Mr. J. Kitley, Castle Nursery, Warwick, scored an easy victory for two bunches of black Grapes, staging Gros Colman, good in bunch, very fine in berry, and superb in colour—a truly meritorious exhibit, worthy of being staged at any show.

In the Apple and Pear classes Mr. Liney, gardener to W. W. Low, Esq., Wellesbourne House, Warwick, was the principal prizetaker. The same exhibitor, as well as Mr. A. D. Christie, gardener to the Marquis of Hertford, Ragley Hall, Alcester, staged fine collections of Apples and Pears in the non-competing classes; and Mr. R. Jones, gardener at Barford House, had several good stands of Chrysanthemums.

A very meritorious group of miscellaneous plants was contributed by Mr. F. Perkins of Leamington, who also exhibited a shower bouquet, a table ornament worked out in yellow Chrysanthemums and Privet berries, and a harp made of grey Lichen embossed with white Chrysanthemums.

HARDY FRUIT GARDEN.

Fruit Room.—Look frequently and carefully over all the stored fruit, seeing that none becomes over-ripe, or when exhibiting the least symptoms of decay remains too long in company with sound specimens. Those exhibiting a tendency to decay, also showing a specked appearance that is likely to spread, lay aside for immediate use. The general conditions to be maintained in the fruit room are a cool and dry atmosphere, but safety from frost, perfect cleanliness throughout, ventilating occasionally, and total darkness. Pears which do not readily ripen under these conditions may be hastened, a few at a time, by placing them in a higher temperature. This method also improves the flavour. They may be returned to cooler quarters when ripened if not wanted at once.

Pruning Apples and Pears.—Where perfectly balanced growth exists pruning is not required, but it is seldom that such a state of things exists. Trained trees of every form need regular attention at various periods of the year to maintain them in fruitful conditions. The system of summer pruning, resorted to with restricted trees to curb strong growths and concentrate the energies of the sap in the formation and feeding of fruit buds, must now have its last stage completed by cutting back to one or two buds the main wood growth, which originally started in the early summer from the midst of the fruiting spurs. These growths under a proper system of management would be duly stopped in June or July at the fourth or fifth leaf, and probably stopped again when the same number of leaves had been produced on a fresh break. These shoots must now be cut away to within one or two buds of their base. If well situated and have been fed by large leaves they may already be fruit buds, but if not they will have a chance of becoming such another season. Another result of summer stopping will now be seen in the plump character of buds produced in former years. Short shoots of the current year's production with a prominent terminal bud may be retained. Spur-pruning is necessary when such become crowded, ill-placed, and obstruct light and air from each other.

Plums and Cherries.—On walls, Plums and dessert Cherries are grown partly on the spur system and partly on the plan of laying in well-placed young wood, which will in the course of the second year form fruit buds. A constant renewal of growth can thus be kept up and old worn-out portions of the trees removed. The foreright shoots produced from the spurs are shortened in the summer to 3 inches, further reducing them now to one bud; or if the portions left at the summer pruning plump up all their buds they may be left full length. If large spaces are left bare on the walls by the removal of old and exhausted branches it may be necessary to unfasten the trees and re-arrange the shoots. All the old bearing wood must be cut out of Morello Cherries, nailing in sufficient of the current year's growth to take its place, fruit being freely produced on this the following season. Orchard trees, after they have been formed into permanent shape, need little or no pruning, Cherries especially, but Plums may be occasionally gone over to remove crowded branches, also misplaced wood and weak spray. Cut out dead wood and remove suckers from the roots of Plum trees.

Gooseberries and Currants.—The pruning of Gooseberries may be carried out now or later. The majority of cultivators, however, defer it until spring, when there is less chance of the buds being destroyed by bullfinches, sparrows, and other birds. There are ways and means of

checking the birds, one of the best being thoroughly dusting the trees with lime, or soot and lime, when damp. In pruning Gooseberry bushes a combination of spur-pruning and retaining young wood is adopted with good results. Overcrowding must be avoided, or the fruit will be small and poor. Allow no suckers to grow from the underground stems. Very gross shoots remove entirely. Grown on walls and trellises the Gooseberry is then subjected to more restriction. *main stems*

trained at about 8 inches apart, and the annual shoots from these summer pruned and shortened in winter to one bud or so, forming spurs. Red and White Currants on walls are trained and treated in the same way, also in the open as bushes, no other system of pruning answering so well for these as spur-pruning. Black Currants are treated differently, the best bunches of fruit invariably being formed on strong young growths of the previous year. Pruning these, then, resolves itself into cutting out old bearing wood now, and leaving young growth disposed at moderate distances apart.

Peaches, Nectarines, and Apricots.—The old bearing shoots may now be pruned out, leaving the final pruning and thinning out until February, when the trees are re-arranged and nailed on the walls. The trees are best partly unfastened now, leaving the young wood free, so that the current year's shoots, which will be the fruit-bearing wood next season, can be exposed to ensure thorough ripening.

Figs.—Before severe frosts occur Fig trees must have some protection, either by fastening mats in front of trees on walls, or by laying dry bracken over the branches. Another plan is to unfasten the trees, tie the branches together, and protect the whole bundle.

Vines.—Outdoor Vines may be pruned. The simplest way of training them on walls is to carry horizontal growths right and left of the main stem as far as space allows, and from these train upright growths 2 feet apart. Spur the lateral growth on these back yearly to a few prominent buds, from which a selection can be made for bearing. When the spurs attain some age the lateral growths thus becoming weak, renew the upright growths by encouraging strong young canes from their base.

Raspberries.—Cut out all the old bearing wood closely to the ground. If grown in clumps each batch of canes being tied to a strong stake, the number of canes may be divided, shortening them at different lengths. This method produces a more even distribution of fruit during the summer, and adds to the better appearance of the bushes. When trained in lines to wires some canes ought to be shortened to the lower length of wire, the rest to the topmost wire, the whole of them being evenly distributed.

FRUIT FORCING.

Vines.—*Earliest House.*—The Vines started early in November to supply ripe Grapes in March and April require the temperature increased to 60° at night after the buds break, gradually increasing so as to have it 60° to 65° at night when they are in leaf, 65° by day in severe weather, and 70° to 75° by artificial means when mild. Moderate ventilation should be given in mild weather, and early, but without lowering the temperature, so as to effect a change of air, allowing an advance of 10° to 15° from sun heat, and closing at midday or soon after. It is a good plan to admit a little air at 70° under any circumstances, to allow the pent-up moisture to escape and entirely displace the vitiated atmosphere by fresh, but with a rising temperature, keeping at 80° to 85° from sun heat, and closing so as to gain 5° rather than lose any benefit of the sun's heat. In sharp weather enough air will gain admittance by the laps of the glass without admitting any through the ventilators; but modern structures are so much improved in close fitting lights and large panes of glass that it is necessary to admit air when the sun is powerful and the external air keen, and the thing to aim at is a sweet atmosphere without giving a check. Tie the Vines in position as soon as growth has well commenced, and before the shoots are so long as to be liable to be damaged in the process. Add fermenting materials to the bed, so as to maintain the heat about the pots at 70° to 75°. These will give out a genial moisture and some ammonia, and are far better than evaporating troughs kept charged with the drainage of stables or cowhouses, or guano water, 1 lb. to 20 gallons of water. The house requires sprinkling with water two or three times a day in bright weather, avoiding a very moist and stagnant atmosphere. Disbudding need not be practised until the bunches show in the joints of the shoots, the extra foliage encouraging the formation of roots, and the superfluous growths being gradually removed the sap will be diverted into and strengthen those which are left.

Houses to Afford Grapes in May.—The Vines to supply Grapes in May should be well established in inside borders, and have ripened the growth early so as to allow of their being pruned and given a few weeks' rest before starting, which must not be further delayed to have fruit ripe at the time named. The outside border, if any, should have the needful protection from frost, a few inches thickness of dry leaves, with a little litter sufficing to prevent the soil being chilled by cold rains and snow. If the roots of the Vines are outside the border should be covered with two-thirds of leaves to one of stable litter, mixed, and moistened so as to promote fermentation, and give a mild, lasting warmth. This must be added to from time to time, removing some of the spent material, so as to maintain its warmth through the winter, or it does more harm than good. The inside borders should be brought into a thoroughly moist condition by applying tepid water, and in the case of weakly Vines supply liquid manure at a temperature of 80°. Start with a night temperature of 55° and 65° by day, unless the weather is severe, when 55° will suffice until the buds commence swelling, but young Vines will require the higher temperature to induce them to start

promptly. If a bed of leaves and stable litter can be placed on the floor of the house, and turned daily, the moisture and warmth will contribute to a good break, and save fuel. Maintain rather a moist atmosphere by syringing the Vines two or three times a day. The rods of young Vines should be depressed to a horizontal line, or below it, to insure the regular breaking of the buds.

Succession House.—The Vines that are to be started at the new year to afford ripe Grapes in June will have been pruned some weeks back and kept cool and dry, but if it has been delayed it should be attended to at once, dressing the cuts with knotting or French polish. The latter stops bleeding, but the house should be kept cool so as to cause the sap to recede rather than flow with the warmth. Dress the Vines after thoroughly cleansing the house, and supply a top-dressing of loam, with some enriching material, after removing the loose surface soil. Midseason Vines from which the Grapes have been cut should be pruned. If any Grapes are still hanging they may be cut and placed in bottles of clear rain water in a cool dry room, where they will keep much better than on the Vines, especially where there are plants in the house, and air cannot be freely admitted on their account. It is a decided advantage to prune the Vines directly the leaves have fallen, as it secures to them a long period of rest, and any circulation of the sap is concentrated on the primary buds, so that they start promptly at the proper time. In pruning adhere to the practice that has proved satisfactory. Vines in good condition will usually give sufficiently large bunches if pruned to one, or at most two eyes, and bunches of 1 lb. to 2 lbs. weight are generally more in demand for home use than larger, as it is essential that the table be supplied with fresh fruit. If larger bunches are required, or the Vines from weakness do not afford bunches so large as desired, leave more growth, only take care to select sound, round, well developed buds on firm well-ripened wood. Dress the Vines, merely removing the loose bark, cleanse the house thoroughly, and put everything into proper order, so that there need be no hurry and badly performed work at starting time. Light and cleanliness are important factors in Grape cultivation.

Late Houses.—Every precaution should be taken against damp. The weather has been very unfavourable to the keeping of thin-skinned Grapes, and still continues to be disastrous to such as have to be kept in houses that have flat and leaky roofs. Thin-skinned Grapes are much better cut and bottled, especially where there are plants in the house, as they keep capitally in any spare room that is cool and dry, it only being necessary to exclude frost and look the Grapes over occasionally for the removal of decayed berries.

Late Muscats require a warmer and drier atmosphere than other kinds of Grapes, the temperature needing to be kept at 50°, and the atmosphere not allowed to become stagnant, but be freely ventilated whenever the weather is favourable. When the weather is dull and damp gentle warmth in the hot-water pipes will be necessary to keep the atmosphere moving and expel the damp, taking care not to allow the temperature to be raised by natural means without giving air, otherwise the moisture will be condensed on the cooler surfaces of the Grapes. Remove all leaves as they become ripe, and strip the Vines of any as yet green laterals, but allow the main leaves to fall naturally. All the thick-skinned varieties are best allowed to remain on the Vines until the new year, as they improve in quality by maturing perfectly on the Vines, especially those having an earthy flavour, as Gros Colman. Sufficient fire heat to maintain a temperature of 40° to 45° is essential, closing the house in damp weather, and secure as far as possible a dry, cool atmosphere and equable temperature.

KITCHEN GARDEN.

Forcing Asparagus.—In but few instances are permanent beds, with sunk pits and pigeon-holed walls between, available for forcing, the usual practice being to lift the roots and force them as required. To be certain of good early produce, ready say for Christmas, the start should be made at once, anything in the shape of hard forcing having an extremely weakening effect upon Asparagus. A dry heat is especially objectionable, though if a fairly deep heated pit can be had this will be found admirably adapted for the purpose. In this place a moderately deep hotbed, largely composed of leaves, or stable manure if this only is available, taking care to well prepare the latter by previously fermenting and turning it two or three times, a violent bottom heat being liable to cook the roots. On the surface of the bed spread about 4 inches, or rather more, of rich moist soil, and if there are no signs of the over-heating place the Asparagus roots on this at once. The latter should be fairly strong, the oldest or most nearly exhausted bed being broken up for the purpose of procuring the requisite quantity of roots. Take every care of these, breaking them needlessly and unduly exposing to cold dry winds being most unwise. Pack them closely together, two or three lights being none too many at one time, and then cover with 4 inches of fine rich soil. It is a mistake to use poor dry soil, and but little of that. Let the roots have some rich moist soil to support them, fresh root fibres soon forming in this, and also a sufficient covering of it to ensure a good length of blanched stem before the shoots are cut or twisted off. Keep a gentle heat in the pipes, and also cover the lights with mats. Asparagus can also be forced readily enough in ordinary frames on mild hotbeds, the treatment being much as advised in the case of pits. Beginners are warned that forced roots are of no further value, and it is therefore most unwise to break up a permanent bed unless it can well be spared. Where Asparagus is regularly and systematically forced an old bed is broken up every winter and a new one formed in the spring to eventually take the place of those destroyed.

The Mushroom House.—Whilst mild weather lasts little or no

fire heat should be turned on to the Mushroom house. Too much heat weakens the beds, and so also do constant daily syringings applied to counteract the injurious effect of fire heat. A temperature of from 50° to 55° answers well for Mushrooms, more especially when the beds are in full bearing. If it is desirable that late spawned beds should be hastened somewhat then may the heat be increased another 5° or 10° with advantage. Supposing fire heat has been very sparingly applied if at all hitherto, then there has been no necessity for repeated dampings and syringings. When fire heat dries the floor and the walls these ought to be damped daily, a damp rather than a dry atmosphere being the most favourable to the production of succulent Mushrooms in quantity. If the beds are syringed daily these are almost certain to become too wet and cold, very many of the tiny Mushrooms that show turning brown, softening and failing to make any further progress. Wait till the beds are moderately dry, or till the best part of the first crop has been cleared off, then remove the mulching material and give a gentle yet thorough watering with moderately hot soft water, slightly impregnated with salt, 1 oz. of the latter being enough for each gallon of water. Return the mulching, adding a little fresh strawy litter if needed, and wait for results. Never be in a hurry to break up what may appear to be a failure. If such beds are very dry six weeks after spawning, then give a gentle watering, otherwise let them alone. It cannot be too often pointed out how unwise it is to cut Mushrooms, leaving the stumps in the bed to decay and spread a destructive mould or fungus all round. Twist single Mushrooms clean out, and remove large clusters with the roots in a mass, filling up the holes thus caused with fresh loam. Thus treated the beds remain productive much longer than otherwise would be the case, and there is no sacrifice in removing large clusters at one time, cooks making good use of buttons as well as other sizes of Mushrooms.

Forming Fresh Mushroom Beds.—Beds formed now will most probably yield very acceptable crops next spring, if not earlier. Well prepare the material by frequent turnings and carefully ward off heavy rains or snow, an excess of moisture in the manure not being easily got rid of at this time of year, and the steam in over-moist beds proves fatal to any spawn inserted in it. Form the beds rather deeper than usual, or say fully 18 inches deep at the back with a slight fall to the front, and spawn directly the heat declines to about 85°. If there is any risk of over-heating delay soiling over for a few days, and should there be much steam in the bed let this escape through deep holes made at short intervals over the bed. Oak leaves being plentiful, and horse droppings somewhat scarce, form a solid bed 3 feet in depth of the former, and on this place a layer of prepared droppings 6 inches deep. Make the latter firm and spawn similarly to beds formed wholly of manure, soiling over and other details being the same. The leaves will generate a gentle and sweet heat, and a good crop of Mushrooms most probably be had in due course. Hotbeds of leaves and manure formed under a bed that requires hastening will soon have the desired effect, and be less injurious to other beds than would be the case if extra fire heat was turned on for a similar purpose.

PLANT HOUSES.

Nepenthes.—These should not be allowed to hang too close to the glass, or they may become seriously checked when severe weather sets in. They will be safe at 18 inches or 2 feet from the roof. Do not allow these plants to suffer by an insufficient supply of water at their roots, also keep them liberally syringed. If this is not done thrips are liable to attack them at this season of the year, now that the atmosphere of the stove is kept much drier.

Cyanophyllum magnificum.—This plant is very liable to become infested with thrips, and if this is allowed the noble foliage is soon destroyed. Place the plants at the shadiest part of the house, where they can be freely syringed and a fair amount of moisture maintained. If thrips do attack the foliage dew or syringe the plants with a weak solution of tobacco water, and maintain a sharp look-out for the pest. *Sphaerogyne latifolia* requires the same treatment and care.

Sonerilas.—These charming foliage plants need care to preserve them in good condition throughout the winter. If young stock has not been prepared for this purpose place the old plants at the warmest end of the stove and water them sparingly, or they may damp. Even at this late period it is a good plan to strike a few of the growing ends of the shoots for fear any of the old plants fail.

Fittonias.—Where constant supplies of these are needed during the winter and spring for furnishing any shoots that can be spared, or stock plants that have cuttings upon them, may be taken off and rooted. These cuttings root freely if inserted thickly together in sandy soil and placed in the propagating frame in brisk heat. When well rooted the plants may be tied up in moss and a little soil, placing them in boxes to grow. By this method they can be lifted out with good balls and need not be potted; in fact, if kept moist they will last as long as if they were placed in pots.

Coleus.—Dark and distinct highly coloured tops look well in 2-inch pots for the table, also for using with moss and small Ferns at the edge of baskets and large vases that have to be kept neatly furnished with plants. They do not last long in rooms, but are attractive, and small specimens will be found very useful. The tops strike freely enough when inserted in small pots and placed on a shelf where the temperature ranges at about 60° to 65°. Give a good watering after insertion and dew the cuttings with the syringe on fine days.

Foliage Begonias.—These when grown in small pots are most useful for furnishing, and care should be taken that the stock of these plants already prepared do not damp. Keep them in an intermediate

temperature where the atmosphere is moderately dry. These plants after they become shabby by use in rooms will do for stock, providing they are cut down and kept on the dry side until they start again into growth.

Seedling Ferns.—A number of these should always be kept on hand, for they are invaluable. When once they have been used in rooms and become shabby they should be thrown away. Seedlings are raised so easily that it is a waste of room and time to recruit plants that have been seriously checked. *Adiantum cuneatum* and *Pteris* of sorts are amongst the most useful. If an easier and readier system is needed than gathering and sowing the spores in pots or pans, pieces of turf may be laid amongst established plants, and in a short time they will be covered with young Ferns. These, if the turves are placed under the plants at the present time, will be ready for pricking into pans about the end of March, and will make capital stuff for another winter. Most Fern spores grow very freely on cocoa-nut fibre refuse, and if a thin layer is placed on the stage for plants to stand upon, hundreds of seedlings can be taken up and potted. We prefer small bunches to single plants because they fill up better at the base and display a much more furnished appearance.

THE BEE-KEEPER.

APIARIAN NOTES.

PUNIC BEES.

BEING anxious for further information about these bees and what has been said about them, I made a search to find what I could about the Tunisian climate. I find that history supports "A Hallamshire Bee-keeper," for we are informed "The winters of Tunis resemble English springs," and that animals during summer become languid. In our own country bees cease to work when the temperature rises above 80°. So far, then, as I can judge, "A. H. B. K.'s" statement, that "their summer (Tunisian) is our winter," is practically true.

PUNICS DYING.

It will be remembered that the correspondent just mentioned stated, in answer to a query of mine, that old Punic bees died in or near their hives. Whether that is correct as a rule I am not prepared to say, but the phenomenon certainly occurred this year at the end of September and the beginning of October, but ceased in a week. The hives did not seem to suffer anything in the end; the bees appeared as active as ever, and the last to gather pollen. In this they were most assiduous, working late and early, though it is remarkable that it disappears when breeding has discontinued.

HONEY GATHERERS.

The successive bad seasons we have had have prevented full tests of the pure Punics, but the superiority of the crosses is now a foregone conclusion. In one case where the average surplus of honey and honeycomb were 50 lbs., a Punic stock that in April was reduced, through an accident, to a cupful of bees rallied so well, that by September it was as good as the best in the apiary. The locality where these high yields were obtained, as they were also last year, is between Loch Lomond and Ben Lomond, the only place I hear of where sealed supers of Heather honey were obtained. In my own apiary the first crossed Syrians are the best, and they were never fed. The Carniolans and crossed Punics followed closely, while pure ones varied from good to middling; but in every instance the pure and crossed were the first to enter their supers, and if spared to see a good summer in 1893 I shall be surprised if pure Punics do not prove superior.

AVERAGE YIELD OF HONEY.

I am now in possession of returns of honey yields from many places. They appear to be much alike, or on an average of 30 lbs. surplus from each hive, the highest being from crossed Punics. The Vale of Clyde appears to have fared the worst. The smoke is perhaps an agent to the low yield, as well as inclement weather.—A LANARKSHIRE BEE-KEEPER.

PUNICS SEALING HONEY.

I SHOULD be glad to know what is the experience of those who have tried first-cross Punic bees as regards the way they seal their honey. I purchased a Punic queen that had mated with another kind of drone, and found that her bees sealed the honey they collected from the Clover quite yellow, while the sealing of the honey collected at the same time by other bees was white. They were largely fed with syrup made from white sugar in the autumn, and sealed also that yellow.—C., Northumberland.

TRADE CATALOGUES RECEIVED.

Dobbie & Co., Rothsay, Scotland.—*Chrysanthemums, Roses, Fruit Trees, Dahlias, &c.*

Hogg & Wood, Coldstream & Duns, Scotland.—*Fruit and Ornamental Trees, &c.*

Thomas Laxton, Seed Grower, Bedford.—*Novelties and Choice Varieties of Seeds for 1893.*

W. Wells, The Earlswood Nurseries, Redhill.—*Chrysanthemums.*

*All correspondence should be directed either to "THE EDITOR" or to "THE PUBLISHER." Letters addressed to Dr. Hogg or members of the staff often remain unopened unavoidably. We request that no one will write privately to any of our correspondents, as doing so subjects them to unjustifiable trouble and expense.

Correspondents should not mix up on the same sheet questions relating to Gardening and those on Bee subjects, and should never send more than two or three questions at once. All articles intended for insertion should be written on one side of the paper only. We cannot reply to questions through the post, and we do not undertake to return rejected communications.

Dressing Pruned Trees (R. F.)—No injury whatever will result to the Oaks if the sawn ends are made smooth and dressed with painter's knotting, and if a coat of lead coloured paint is also given the cut ends will not be conspicuous. In removing large branches it is important to make an under-cut with the saw, or the branch in falling may tear the stem of the trees. We have seen thousands of branches removed and treated in the manner suggested without any injury accruing.

Propagating *Euonymus europæus* (P. D.)—The seeds may be separated from the pulp of the berries and sown in light moderately rich soil, about half an inch deep, in the autumn or early in the spring. The seedlings will make more vigorous plants, and be longer before they become fruitful, than plants raised from cuttings of bushes that have produced fruit. The cuttings should be of the ripe young shoots, cut transversely below a joint, and be planted two-thirds their length in a border in the autumn, or soon after the leaves begin falling, making the soil firm about them.

Fungus on Carnations (W. M. M.)—The name of the fungus that usually attacks Carnations is *Helminthosporium echinulatum*, and it may be this that is infesting your plants, though the specimens you send are too dried and fragmentary for determining the point. When the fungus is established in the leaves it is most difficult to extirpate. The ammoniacal carbonate of copper solution, if applied in time might prevent the invader taking possession of the plants. For methods of preparation and application see advice under Tomatoes on page 386, issue of October 27th of the present year, also page 409, November 3rd.

Grape Vines for Unheated House (A Constant Reader)—There are no Vines suitable for growing in a house (not heated) to supply Grapes during the last three months of the year, as those are the worst months to keep Grapes in good condition, and they require absolute freedom from the damage of a stagnant atmosphere and frost. It is feasible, however, to have Grapes from an unheated house that will keep after being cut from the Vines if suspended in a cool, dry room, and supply fruit at the time required. If you can do that, namely cut and bottle the Grapes early in October, or before they are damaged by cold and wet, taking care to have them thoroughly ripe in September, you may plant the following:—Black Hamburg, Madresfield Court, and Foster's Seedling, say two of each. It would be better to heat the house.

Celery Insects (Anxious)—You ask for the name of the insect "which Celery growers are infested with." We presume you mean the plants. The maggots in the leaves are caused by a fly, *Tephritis onopordinus*, depositing eggs in them. The resulting maggots soon produce perfect insects, and two or three broods of flies may be produced in a season. The perfect fly is a little more than an eighth of an inch long and about three-eighths of an inch across the wings, body yellowish brown. The maggots of the last brood change to pupæ and rest in the ground or in rubbishy heaps, and flies emerge from them in the spring. Infested Celery refuse should be burned, and it is a good plan to trench the ground, burying the top 6 inches that contain pupæ well down to prevent the emergence of the insects. Egg deposition may be prevented by occasionally spraying the plants with a decoction of quassia mixed in a solution of softsoap, stirring in very briskly a wineglassful of petroleum to 3 or 4 gallons of the mixture and keeping it stirred during application. Maggots in the stems of Celery are caused by a fly, *Piophilus Apii*. The worm-eaten stems should be burnt and the ground trenched as above advised.

Diseased Parsnips (*R. H.*).—The specimens are cankered in much the same way as occurs in the roots of Parsley, also Carrots, and many other umbelliferous plants. The want of certain mineral soil constituents, or an excess of others, will produce the gangrene. Wetgaining access to the internal tissues enlarges the ulcers, because a fungus accompanies the decay and "eats up" the contents of the ruptured cells, leaving the attacked portion of the root brown and black on the surface. The tissues of the attacked part of the root are permeated by a mass of mycelium, evidently that of *Protomyces macroporus*, but there are no "fruits" of that or any fungus on the specimens, which may be due to the care taken in washing the roots and so obliterating the traces. The rains alone are sufficient to account for the abnormal condition of the Parsnip roots, as the prolonged and excessive moisture would tend to greater alkalinity, especially in the richer and lower portions of the ground, and so cause the ulcers on the skin and the spread of the gangrene. Wild Parsnips are subject to a similar ailment, also Hemlocks, which often have the roots much gangrened and black from the devastation of fungi. There is no remedy for the diseased roots, and the only preventive is to trench the ground, so as to bury the spores of fungi that rest in the upper layer. A change of ground is also beneficial, and a dressing of lime or gypsum would correct the soil's alkalinity.

Trapa bicornis (*Birmingham*).—You appear to think the managers of the Birmingham Show make a mistake in admitting articles for sale that are not appropriate with its objects. We have often noticed show rooms resemble bazaars, and the public after paying for admittance being tempted to buy curios and novelties of various kinds. What you send is not a bulb, and perhaps the vendors who had such a brisk sale for the curiosity described it in ignorance of its real nature. *Trapa bicornis* is a Chinese water plant, introduced to this country in 1790. The name *Trapa* is an abridgement of *calcitrapa*, the Latin name of a dangerous instrument called caltrops, furnished with four spines, which was formerly used in war to impede the progress of cavalry. *T. natans* is a curious aquatic with long brown and green roots and floating leaves, with petioles inflated into a tumour, as in the marine *Algæ*. The seed is larger than the kernel of the Filbert, with two cotyledons, one large, and the other very small, and not increasing in size during the germination. Hence Gærtner considers this plant like the *Nelumbium*, as in a sort of middle state between the *Monocotyledonæ* and *Dicotyledonæ*. The nuts are farinaceous, and are esteemed as nourishing and pectoral. The skin with the spines being removed, there is a white sweet kernel within, somewhat like a Chestnut. They are sold in the market at Venice under the name of Jesuits' Nuts. They are also much eaten in Switzerland and the south of France. Some of the canals at Versailles are covered with the plant; and Neill informs us (*Hort. Tour.*) that the nuts are sometimes served up like Chestnuts. Pliny says that the Thracians made them into bread; and Thunberg states that the seeds of *Trapa bicornis* are commonly put into broth in Japan. In this country the plant is generally kept in a cistern in the stove, and so treated was fruited by A. B. Lambert, Esq., in 1815, and specimens of the fruit sent to the Horticultural Society. *T. bicornis* is cultivated by the Chinese in marshes, and the nuts are used as food.

The Cobham Apple (*J. T., Fifeshire*).—The Apple that has been forwarded to us from your manse garden is the true Cobham. We say "true" because we have seen Apples so named that were not, but Blenheim Pippins. You rightly consider your Apple "one of the finest grown." It is indeed a valuable Apple, and we are pleased to see the good bright specimen from the north. We cite what Dr. Hogg says about this Apple in the *Fruit Manual*:—"Fruit large, ovate, handsomely and regularly formed. Skin clear yellow, tinged with greenish patches, and strewn with dark dots; on the side next the sun it is marked with a few faint streaks of crimson. Eye large and open, like that of the Blenheim Pippin, and set in a wide and plaited basin. Stalk short, deeply inserted in a round cavity, which is lined with rough russet. Flesh yellowish, tender, crisp, sugary, and juicy, with a rich and excellent flavour. A very valuable Apple, either for the dessert or culinary purposes; it is in use from November to March. This variety has all the properties of the Blenheim Pippin, and is much superior to it, keeps longer, and has the great advantage of being an early and abundant bearer. I met with this excellent Apple in the neighbourhood of Sittingbourne, in Kent, about the year 1842. The account I received of it was, that the original tree grew in the garden of a cottager of the name of Pope, at Cellar Hill, in the parish of Linstead, near Sittingbourne. It was highly prized by its owner, to whom the crop afforded a little income, and many were the unsuccessful applications of his neighbours for grafts of what became generally known as Pope's Apple. The proprietor of Pope's cottage built a row of other dwellings adjoining, in the gardens of which there were no fruit trees, and, for the sake of uniformity, he cut down Pope's Apple tree, notwithstanding the offer of 20s. a year more rent to spare it. The tree, being condemned, was cut down in 1846, at which period it was between fifty and sixty years old. The name of Cobham was given to it by Kirke, the nurseryman at Brompton." It may be added that Mr. Fairbeard, the raiser of the Champion of England Pea, obtained grafts from the old tree that was cut down, and thus secured the variety. You will not err by increasing the number of trees by establishing grafts on young stocks. This variety differs from Beauty of Hants, which is also a good Apple, and the trees bear well in a young state.

Names of Fruits.—*Notice.*—Special attention is directed to the following decision, the object of which is to discourage the growth of inferior and promote the culture of superior varieties. In consequence of the large number of worthless Apples and Pears sent to this office to

be named, it has been decided to name only specimens and varieties of approved merit, and to reject the inferior, which are not worth sending or growing. The names and addresses of senders of fruit to be named must in all cases be enclosed with the specimens, whether letters referring to the fruit are sent by post or not. The names are not necessarily required for publication, initials sufficing for that. Only six specimens can be named at once, and any beyond that number cannot be preserved. (*N. Cutter*).—1, Beurré Bosc; 2, Marie Louise; 3, Winter Nelis; 4, Glou Morceau; 5, Not known, worthless; 6, Knight's Monarch. (*A. M. M.*).—1, Comte de Flandres; 2, New Hawthornden; 3, Catshead; 4, Cobham. (*Herbert*).—1, General Todleben; 3, Spanish Warden; 4, Golden Noble; 5, Lord Suffield; 2 and 6, Probably continental varieties, and of little value in this country. (*F. J. G.*).—1, Nec Plus Meuris; 2, Worthless; 3, Swan's Egg; 4, Probably Louise Bonne; 5, Not in condition to be named; 6, Blenheim Pippin. Your specimens are very inferior. (*Henry Jones*).—Pitaston Golden Wreath is the conical Apple and Aromatic Russet the round one. (*C. H.*).—Mannington's Pearmain. (*J. H.*).—1, Cox's Pomona; 2, Kentish Fillbasket; 3, Possibly a highly coloured Prince Albert; 4, Hoary Morning. (*J. J. Craven*).—1, Brown Beurré; 2, Not known. Graft the tree with a better variety. (*J. H., Sussex*).—1, Sussex Peach; 2, Not known; probably local; of no value.

Names of Plants.—We only undertake to name species of plants, not varieties that have originated from seed and termed florists' flowers. Flowering specimens are necessary of flowering plants, and Fern fronds should bear spores. Specimens should arrive in a fresh state in firm boxes. Slightly damp moss, soft green grass or leaves form the best packing, dry wool the worst. Not more than six specimens can be named at once, and the numbers should be visible without untying the ligatures, it being often difficult to separate them when the paper is damp. (*J. R.*).—1, Begonia, probably *ricinifolia*; 2, Specimen insufficient, must have flowers; 3, *Dictyogramma japonica*; 4, *Adiantum cuneatum grandiceps*; 5, *Lastrea setigerum*; 6, *Arabis alpinus variegatus*. (*W. E.*).—1, *Polystichum aculeatum lobatum*; 2, *Lastrea filix mas*; 3, *Polystichum angulare*; 4, *Lastrea propinqua*; 5, *Polystichum angulare incisum*; 6, *Lastrea filix mas cristatum*. (*May*).—*Cupressus*, probably *Lawsoniana* (no particulars of habit given); 2, *Euonymus europæus* (Spindle Tree); 3, *Begonia nitida*; 4, *Jasminum nudiflorum*; 5, *Woodwardia radicans*; 6, Appears to be a *Goniophlebium*. Your questions will be attended to.

COVENT GARDEN MARKET.—NOVEMBER 30TH.

AN AGRICULTURAL CONFERENCE.

ON December 7th a National Agricultural Conference is to be held in London to discuss the "Agricultural Crisis," and suggest ways and means of affording relief to "Depressed Agriculturists." Preliminary meetings are being held all over the country, protection and fair trade are again to the fore, State aid is demanded in the guise of taxation of imports, help from without is demanded, but at none of the meetings does it appear that any mention has been made of the possibility of help from within, of changes in management, of contraction of the area of unprofitable crops, of the extension and improvement of every branch of agriculture wherein profit is still possible. That general sympathy is accorded to farmers in their struggle with adversity there can be no doubt, but it partakes very much of the character of that pity which is akin to contempt. Why is it that we hear so much of the stubbornness of farmers? Why is it that advice is showered upon them? It must be because there is a general feeling that while complaining loudly about the low price of cereals, farmers generally have done so little to adapt their practice to the changed condition of markets. A mighty revolution in the food supply of the globe is nearing its consummation, which must more and more reduce the arable soil of these islands. Butter, cheese, beef, mutton, pork, Apples, jam, eggs, poultry, Potatoes, and the like we ought still to be able to produce better than the foreigner; and even Wheat where the farmer picks his seed and cultivates scientifically, but on the clay the bread crops must go. This is the general opinion ably expressed recently by the *Daily Telegraph*, which well points out the folly of trying to comfort the farmer with the mirage of impossible enactments. The chemist who should teach them how to fix and utilise in manure the nitrogen gas which runs to waste from a single factory would do more for our home agriculture than mere pandering to prejudice ever can do.

The sort of conference we should like to see would be for the discussion of farm management in every possible aspect of it. The faults of home agriculture are so palpable, the possibility of reform so clear, that we would have the whole matter taken in hand, discussed point by point, and reasonable—i.e., possible, standards of excellence decided upon both in crop and stock. This would of course open up a very wide field, but not necessarily beyond control. Take sheep for example, their true place and value in farming economy should be fully explained. There are hundreds of farms where a sheep-fold is never seen. Some of our best dairy farmers say they object to sheep among their cows, because the sheep consume all the choicer herbage, and the quality of cheese or butter suffers. But this is clearly a mere matter of detail; it is in autumn and winter that sheep-folding on the pasture of all upland farms does so much good. The points are to fold so closely as to manure thoroughly, and to have the sheep off the cow pasture before free growth begins in spring, so that at turn-out time there may be a full strong growth of rich herbage. Under such management sheep are a help and not a hindrance in dairy farming. Storing the land with fertility in the most economical manner just when the cows are in the yards, there would then be an improvement both in the quantity and quality of the milk, and a proportionate improvement in both cheese and butter.

Take also dairy cows; see what inferior animals are kept, how low the milk average is, how inferior the quality of the milk. The mismanagement of cows in purely dairy farming districts is notorious. Improper and insufficient food in winter as well

as a want of shelter tell with such severity upon the cows that the farmer sustains a serious annual loss from the consequent lowness of condition. So, too, with store cattle, with pasture itself, with crops of all kinds; everywhere and in everything in ordinary farming have we evidence of mediocrity, of a want of thoroughness, arising from a combination of ignorance, carelessness, and prejudice.

If farmers had done their utmost with the land and with the animals of the farm, and yet found it impossible to achieve a reasonable measure of success, then they would be justified in making an appeal to the nation and to the legislature for State aid. The question of relief should not rest upon the possibility of growing Wheat. A man who cannot obtain at least five quarters per acre ought not to grow Wheat at all. But then if he turns to Oats would he so plough, apply manure, and sow as to get at least ten quarters, or eighty bushels an acre? We verily believe that many farmers are ignorant of the possibility of obtaining such a crop, and they are precisely the men who clamour loudest for help.

WORK ON THE HOME FARM.

A fine open November has been favourable to the clearance of root crops, that fortunately have not suffered from frost, which, though prevalent for a few nights early in autumn, did no harm, and winter is setting in so mild and misty, without heavy rain, that all winter corn should have been got in well. The rapid extension of fruit farming leads us to remind planters of the importance of planting belts for shelter when the fruit trees are planted. Austrian Pine, with Larch as nurses, is a common and very useful belt for thorough shelter. We have no better evergreen tree for shelter than this Pine; it is hardy, transplants well, is of singularly free robust growth, and is admirably adapted for planting in the most exposed situations. While advising the planting of half-standard fruit trees generally we strongly recommend dwarf bushes of Apples, Pears, and Plums for all bleak situations, because they can be so easily protected from high winds—from cold nor'easters in spring, which destroy the blossom; and high sou'-westers in autumn, which batter and shake off the fruit.

Especial attention must now be given to the ewe flock; let the feet be examined frequently for the clearance of dirt from the hoof division, the careful paring away of overgrown hoofs, and the dressing of any cases of foot-rot. Let this be done gently, with all possible care, using a small sharp knife, and avoiding such deep cuts as to cause bleeding. Very strongly do we advise the home farmer to look to this matter himself, and so make sure of kindly treatment, and of sound feet for the lambing, which will begin among forward ewes in the course of a few weeks. Feed well, taking the condition and size of the ewes as your guide in quantity of food given in troughs. Avoid an excessive use of roots now; a little sliced and mixed with trough food does good, but much is dangerous, and is to be avoided. See to this; trust no shepherd to use roots at his own discretion, and never suffer him to cut roots himself; there is by far too much risk of harm to the ewes to leave anything to chance. The master must know exactly what is given and how it is used. Keep the forward ewes altogether off folds on arable land. They should now be on pasture in a quiet sheltered spot, preferably near the home close, so as to be under close supervision.

REMARKS.

20th.—Rain in the small hours; fine day, sunny from noon to about 3 P.M.; a little fog in evening.
 21st.—Misty early; sunny from 9 A.M. to noon; cloudy after.
 22nd.—Overcast throughout.
 23rd.—Fine, but sunless.
 24th.—Overcast, with occasional drizzle and generally misty or foggy.
 25th.—Fair morning; foggy and damp in afternoon and evening.
 26th.—Overcast and dull morning; heavy rain from 2.30 P.M. to 5.30 P.M.; fine evening and night.

A generally mild week with no frost, except slight on grass on two nights.—G. J. SYMONS.

MOST opportunely came the notes on the above subject (page 433), and whilst thanking the contributors I should like to mention a grievance that concerns me more, and is of deeper importance than whether we shall "bunch" or show single flowers; or, as to whether we shall show distinct species or only distinct varieties. Before alluding to my grievance I may perhaps be permitted to suggest a way out of the first difficulty—i.e., whether we shall show in bunches or singly. Delphiniums, Pæonies, Phloxes, Eryngiums, and other large kinds might be effectively shown singly; but what is to become of *Aquilegia glandulosa*, *Geums montanum* and *coccineum*, *Coreopsis lanceolata*, *Papaver nudicaule* and its varieties, and a host of other beautiful flowers, dear alike to exhibitor and non-exhibitor? Might we not adopt a tube of one size—say, 1 inch or 1½ inch in diameter, for amateur classes, and a tube not exceeding 2 inches for trade growers? This would check the system of crowding a huge mass of flowers together; it would also secure a uniformity in the size of the bunches, and place each exhibitor on an equal footing.

Now as to whether species or varieties shall be shown. In my opinion the latter might with advantage be adopted, and in reply to "Devon," on the page alluded to above, I should certainly not be inclined to withhold points from a stand containing two Phloxes, two Delphiniums, or two Lilies, providing they were dissimilar in colour. We have some lovely shades of light blue amongst the Delphiniums, and also some glorious deep purples. Can we afford to "Boycott" either the one or the other? The Phloxes, too, embrace a wide range of colour, the crimson scarlets forming a great and pleasing contrast to the pure whites, and white with rose or crimson centres. Would not two varieties of Phloxes, or Delphiniums of different colours, be better than too many yellow composites?

The subject I ask your help upon is this, What terms shall we agree to use in the schedules to indicate what we require to be shown? Are we to stick to the term herbaceous, or shall we allow the term "hardy perennial" to appear, and thereby allow the few hardy flowers which are not truly herbaceous to be shown on the same stands? Carnations—and of border Carnations there are now some gems—*Antirrhinums*, *Dianthus*, and *Pinks* would then enrich our collections, and we should run no risk of disqualification. I have often been asked for a definition of the word "herbaceous," the proper definition of which, I believe, is "a perennial root that produces an annual stem." Nothing has led to so much jarring as that mystic word herbaceous. At one large and old established exhibition *Liliums* are excluded, at another all bulbous plants of every description, whilst at a third Phloxes are not allowed to appear in the collections, all because of that term—herbaceous. During the present year a friend of mine wrote to the Secretary of a floral society, asking what amongst hardy flowers would not be regarded as herbaceous at their show, and he received in reply that Phloxes, *Gladioli*, and *Liliums* would disqualify. A large prize was offered at one of the most fashionable floral exhibitions of this year for a collection of herbaceous flowers. The first prize collection embraced a shrub (*Santolina*), the second prize collection contained over two dozen bunches of Carnations and Picotees, also several bunches of *Pentstemons* and *Antirrhinums*.

What shall we do to remedy all this? Will the Editor appeal

to the secretaries of the various floral exhibitions and beg of them to carefully consider the wording of their schedules? For my part I should be glad to see the word "herbaceous" expunged from every schedule and the word "perennial" substituted, then all could meet on equal terms without fear of being disqualified. I had no intention of writing to this length, but, whilst I am on the subject, may I ask if hardy perennials, grown indoors, should be allowed to take first honours over those grown out of doors? If we grow them inside, and produce flowers in June that would not naturally be in bloom outside until July or August, do we not defeat one of the main objects of our exhibition, which is, to educate the public taste, and to prove what may be done in an ordinary and natural way?—E. R. SHANKS.

[We give prominence to the above communication, because it relates to a subject of great and growing importance—the exhibition of garden flowers, and the confusion that exists in their classification as set forth in the terms of prize schedules. Having regard to the divergent views, not of exhibitors only, but of the officials of societies in respect to the meaning of the term "herbaceous," and also of the want of discrimination between species and varieties, it is quite time that the directors of shows and the framers of schedules should make a serious attempt to reduce order from chaos in setting forth as precisely as possible the kinds of flowers which they desire to invite and which to exclude. When we find such as *Liliums*, Phloxes, and *Gladioli* are not admissible in stands of "herbaceous" plants, all of which flowers are eligible, and at the same time see, as we have seen, *Antirrhinums*, Carnations, *Pinks*, *Pentstemons*, *Santolinas*, and even shrubby *Spiræas* and Tea Roses, admitted, and the stands containing them honoured with prizes, there is no wonder that exhibitors who comply strictly with the schedules are dissatisfied, and it is certain the public cannot be instructed by such vagaries.

The time for a reform has come, and we appeal very earnestly to committees of floral societies who wisely offer good prizes for hardy garden flowers to first endeavour to gain a clear conception of the significance of the terms "herbaceous" and "perennial," and then employ either one or the other—that is, if either of them embodies what they wish to have represented in their exhibitions, and if they do not to adopt a broader term familiar and expressive—namely, "hardy border flowers."

If prizes are offered for "hardy herbaceous plants" then all kinds that produce their growths and flowers in summer, die down in the autumn, and spring up again the following year are admissible, including bulbous plants; or, as our correspondent cites, "A plant with a perennial root that produces an annual stem" is herbaceous. It is not the nature of *Antirrhinums*, Carnations, Picotees, *Pinks* and other *Dianthus*es, *Pentstemons*, and others that could be named to die down in the autumn and grow from the roots in spring. They are either evergreen or semi-deciduous, and therefore not strictly eligible for the herbaceous class. Still, many persons will be of opinion that it would be hard, not to say unreasonable, to exclude them from collections of garden flowers staged in competition for prizes, seeing that they play such an important part in the adornment of gardens. They would be admissible in a class designated "hardy perennials." This is a much broader term than "herbaceous" is, and we agree with Mr. Shanks in his preference for it. But we have to remember that, without any qualification, Roses, Clematises, and various flowering shrubs would be admissible, while biennials—*Canterbury Bells*, for instance—would be excluded. We suspect there are many persons who grow hardy flowers admirably, and could show them well, would not quite know what to include and what to exclude from a "perennial" class.

We know there are persons who would not exclude any hardy flowers that render gardens beautiful from collections at shows, and there are others who would desire certain limitations. We find no fault with either view; but we do wish to see the con-

ditions for exhibiting so clearly expressed that it would be easier for them to be comprehended than misunderstood by the majority of cultivators. We should like to know what objections can be urged against a class designated neither "herbaceous" nor "perennial," but "hardy border flowers?" This has at least the merit of simplicity, and has a good old English and very familiar ring about it. It is also more comprehensive than either of the other technical terms, and may indeed be too comprehensive. It would include annuals and flowering shrubs grown in borders; and "Why not?" some may ask. "Why exclude Sweet Peas and Tea Roses?" Others would prefer their exclusion. It would be as easy to reject or admit them by the insertion or otherwise of a proviso. A class entitled for example, "Twelve bunches of hardy border flowers, distinct" (annuals and shrubs excluded), or either one or the other, would surely be clear to all.

But while a class thus entitled would be clear enough as indicating the classes of flowers, in another respect it is most faulty, and purposely so rendered to show its incompleteness. Under such conditions a person could show as many Pinks, say, or any other kinds of flowers, as he liked, and could not be disqualified if the varieties were distinct. It is imperative that the word "kinds" be added to such a class, as "distinct kinds" means that only one variety of each is admissible in the absence of a note to the contrary, such as "a light and dark Delphinium," or a "light and dark Phlox" admissible, as suggested by Mr. Shanks. This would be more appropriate in large than small collections, on the same principle that two dishes of Peaches, Nectarines, and Plums are admissible in large collections of fruit.

Another matter ought to be clearly comprehended by exhibitors—namely, that the number of varieties mentioned in schedules must not be exceeded. Thirteen or more varieties in a class for twelve disqualifies, yet scores of stands are seen yearly which contain two or three varieties of the same kind of flower in a bunch, such as Antirrhinums and others, and all such ought to be disqualified, as many are, because not in accordance with the schedule. Matters of this kind should be made clear in the stipulations.

The dimensions of bunches should be in some way indicated for securing something like uniformity in competing collections in respect to bulk, then quality alone will have to be regarded in adjudications. Our correspondent's proposition is worthy of consideration, indeed the whole subject of his letter is worthy of thought and discussion by those of our readers who are interested in it. They are of necessity many, seeing how widely and deservedly popular have become our hardy border flowers.]

EDUCATION IN GARDENING.

(SILVER MEDAL ESSAY, BY MR. E. D. SMITH.)

SUBJECTS TO STUDY.

GARDENING in its broadest sense embraces, not only complete practical skill in all the operations connected with its pursuit, but considerable knowledge of the best known and demonstrated scientific facts bearing on horticulture in general. Besides this, it is necessary to be thoroughly acquainted with all the most important points in practical knowledge acquired by our forefathers, stored up and preserved in the valuable literature of the past. How much we owe to the past can only be gauged by those who with an educated eye can look upon the vast extent of knowledge which strenuous efforts in many directions have brought together, constituting the science of horticulture. These efforts still continue, widening the foundation on which the art of gardening stands, and it is to the results which have thus been acquired, proved to be sound, reliable, and worthy of adoption, that consideration is invited.

The search for improvement is profitable and praiseworthy. Whoever enters upon it with a laudable desire to extend his outlook, increase his power and skill as a workman, and broaden his intellect, has mounted the first step on the ladder of advancement, to the summit of which he is gradually impelled by the powerful stimulus of the knowledge already gained. To become a capable, intelligent, skilful gardener, a man cannot court too wide acquaintance with all horticultural subjects, as well as all near related lines of knowledge which have more or less paved the way,

making it smoother and easier to obtain better elucidations of numerous difficult points relating to horticulture in every phase.

In these days of compulsory elementary education it is quite fair to assume that every young man who aspires to a wide knowledge of gardening has, at least, when entering on his probationary period, acquired a moderately solid foundation of learning on which he can begin to raise a superstructure, the continued building of which will constitute an ever-increasing and ever-widening delight. It is a well-known fact that the knowledge a gardener should possess ought to be of a manifold character. The ideas, however, as to what really and fully constitutes a model gardener's education are numerous and divergent. Yet it is possible to mention a few subjects which, fully grasped, though perhaps not technically and minutely understood in every detail, would prove of immense importance to the right performance of gardening duties.

In the first place it may be well to deal briefly with a subject which has not always given to it the attention it deserves—namely, the art of spelling or orthography. Even a good elementary education does not always secure proficiency in this art. A man may be an excellent gardener, well versed in most things that pertain to his profession, remarkably successful as an exhibitor, grower, or probably judge of others' produce, yet a deficiency in his spelling powers sadly stains his escutcheon of success when he is obliged to commit to paper views and opinions, or give a clear exposition in writing of some of his successful methods of culture. Therefore let correct orthography be one of the first aims of every gardener when aspiring to an intellectual grasp of his profession allied to practical knowledge.

Next in importance to the last named acquirement is that of obtaining at least a brief elementary knowledge of English grammar. Perhaps its importance may not have been fully considered when at school, where of course the parts of speech were first learnt, but not sufficiently grounded in the pupil so as to carry him safely and decently through when expressing his thoughts and ideas in writing.

Coming now to matters that directly bear on horticultural knowledge, mention is first made of botany, which should take a leading place as a subject to study. Botany implies a knowledge of plants. "It is," says Leo H. Grindon in his "British and Garden Botany," "the science which considers the nature of plants—how they are constructed, what they are composed of, the circumstances of their life and growth, what they are good for, the countries and places they inhabit, their various and charming beauty, along with many other curious and interesting facts, such as render the study of it exceedingly pleasant and instructive at all seasons of the year and wherever we may go." It will be seen, therefore, that it is important to know as much as possible of such an important science to a gardener as that of botany.

The study of geology, which teaches all about the interior structure of the earth, may be varied with botany. Geology is capable of rendering much assistance to the gardener, as it furnishes him with some most interesting facts of the history of the earth which it is desirable he should know. In the lesson on "Geology" in "Cassell's Popular Educator" the writer says, "The study commends itself to all, since it requires no expensive apparatus, nor yet a preparation, which all other sciences demand ere the student can enter on their practice. Young and old, gifted with observation, may at once become practical geologists; and by never passing a stone heap without an examination, or never leaving a quarry or gravel pit unsearched, they will soon lay the foundation of a geological cabinet." A wide and deep acquaintance with the subject may not be attainable, but that which can be gathered about such an interesting science is certainly worthy of attention.

Elementary chemistry is a subject of much importance to a gardener, as it teaches the nature and properties of the substances composing the crust of the earth, how they combine in certain exact proportions forming quite different substances.

Geometry may be studied with great advantage. Without its aid landscape and ornamental flower gardeners would be unable to execute much which having that knowledge they can now do with ease, dexterity, and precision. The modern system of carpet bedding calls largely upon geometrical skill in depicting designs and marking them out in well defined divisions of colour. It affords scope for many original designs and encourages the display of much ingenuity.

Passing now to the immediate subject of practical gardening, we find much that it is necessary to study which may be embraced under the general subject of the theory and practice of gardening. The propagation of plants in all their various ramifications, giving extensive and special study to those which are grown extensively in gardens, either outdoors or under glass, should form the subject of constant attention, so that definite knowledge as far as possible may be gained on every important family of plants. The most important operations in garden practice on which information may be sought from reading, are the culture of fruits, vegetables,

and flowers; the soil and its management, including draining, digging, trenching, manuring; planting, sowing, protecting, watering, and pruning. All these operations in gardening are the key-notes to success. On their proper performance at the right times and in the most intelligent manner depends largely whether success is achieved or not. Study and practice ought to be combined whenever possible, but unfortunately opportunity cannot always be had to carry out methodically a set course of study.

The management of glass houses is at the present time one of the most important features in a gardener's duties. Strict attention must be paid to acquiring all the knowledge possible on this point, as structures containing valuable plants must have continual and exact attention. Other matters which will need study are the effect of light and shade upon plants; the correct temperatures necessary to their well being; the amount of air they require, with the best means of keeping them vigorous, healthy and clean. The principles of heating by hot water must be fully understood before any attempt to manage such appliances can be sanctioned. Depending solely upon routine knowledge without comprehending the principles is the means of failures taking place, which prove mysterious because they are not understood through the fact that the causes from insufficient knowledge are not discoverable.

The above are some of the leading subjects for a gardener to study. The list is not exhaustive, but it is sufficiently extensive to enable anyone carrying it out fully and carefully by study and practice to provide himself with a vast amount of information which cannot fail to be useful. In addition to studying particular subjects as exhaustively as possible, a wide and judicious course of general reading will add much to the zest for acquiring information. If the matter selected is often outside the pale of horticultural knowledge generally, it may indirectly afford some valuable assistance to the student. Avoid light and frivolous literature of an evil tendency, but that of an instructive and edifying tone may be welcomed as a relaxation.

In gardening as in other things, there are fashions followed, and the gardener should with the aid of his horticultural periodical seek to gain as much information as he can about flowers, plants, and fruits which occupy a leading place in the public regard.

(To be continued.)

CALLA NILOTICA (?) AND OTHERS:

A FRENCH nurseryman, Monsieur Letellier, of Caen, is now offering tubers of a *Calla* under the above name at the moderate price, for a new plant, of 5 francs, or two for 9 francs. He says they were collected on the banks of the Nile, and were described to him by the collector as bearing very beautiful white and red flowers. As no *Calla* hitherto known produces flowers of more than one colour, I at first thought on reading the advertisement in the *Revue Horticole* that the plant could not be a *Calla* at all, but might be a *Nelumbium*, as *N. speciosum* has large pale rose-coloured flowers, which may be seen annually in the tropical Nymphaea house at Kew. I therefore out of curiosity sent for a tuber to see what it was, and having received it in due course it is evident that it is a *Calla*, and it is to be hoped that when it blooms during the spring of 1893 it may turn out to be a new and fine variety.

When writing a short time ago in your columns about the yellow *Calla* known as *C. Elliotti* (page 31), I ventured to describe it as a hybrid between *C. hastata* and the ordinary *C. æthiopica*, but my views were demurred to and called in question by your correspondent, "E. H. M." (page 122), who, if I remember rightly, expressed his opinion that it was a species and not a hybrid, as I had stated. Now, I have recently received an unsolicited testimony in confirmation of my opinion from a florist friend who grows a large collection of these plants, and is a most careful and accurate observer of all their points and characteristic peculiarities. This gentleman writes to say that the fact of *C. Elliotti* being a natural hybrid between *C. hastata* and *C. æthiopica* is, to his mind, clearly proved not only by its spotted leaves and the shape of its spathe, but by its being a summer bloomer, which *C. hastata* is.

It is to be hoped that the splendid golden *Calla* shown at a recent Drill Hall meeting of the R.H.S. by Mr. Whyte under the name of *C. Pentlandi* (which must be changed for classical correctness to either *Pentlandiana* or *Pentlandensis*, being the name of a place, and not of a person) will reproduce itself true from seed, as *C. Elliotti* does, and that it will before many years be available for the decoration of many greenhouses. I also venture to hope that before it is ready for distribution its name will be definitely changed from that of the residence of its fortunate introducer, which it now bears, to what should undoubtedly be its true and correct designation, namely, *Calla æthiopica aurea*, as it is admitted by all who have seen it to be merely a very fine bright golden form of the type.—BOSCOBEL.

CYPRIPEDIUM MORGANÆ BURFORDIENSE.

THIS fine variety attracted some attention at the Drill Hall on November 15th, when it was shown by Sir Trevor Lawrence, Bart., Burford Lodge, Dorking, and deemed worthy of a first-class certificate. The specimen exhibited had a scape about 18 inches high, carrying one fully expanded flower, and if my memory does not fail me one or two buds. To the inexperienced eye the flower at first sight closely resembled that of the type, but on examination proved to be a decided improvement. The dorsal sepal is broad, of a light colour, suffused with a pale purplish tint, and marked with dark veins. The petals are about 3 inches in length, of a creamy white colour, and heavily spotted with chocolate. The most striking feature about this Orchid, however, is the lip. This is very large, and of a purplish red colour, forming a pleasing contrast to the other portions of the flower.—ORCHIDIST.

CATTLEYA ALEXANDRÆ.

REGARDING *Cattleya Alexandræ*, Mr. W. Watson, in the "Garden and Forest," says:—Of this I am a little suspicious, a plant of it having flowered lately at Kew—the first to flower anywhere, I believe. It is one of the *C. guttata* class, and, judged by the plant flowered here, one of the worst of them. The flower is 3 inches across, like that of *C. guttata* var. *Leopoldi*, the sepals and petals dull greenish-brown with a few reddish blotches, and the labellum rosy mauve. Of course, the Kew plant may be the worst possible variety, and the collector who pictured and described this discovery as a many-flowered beauty may not have seen anything so poor as the first flower that has opened in England. We hope not.

CYPRIPEDIUM ARTHURIANUM PULCHELLUM.

DURING the past few years Messrs. J. Veitch & Sons, Royal Exotic Nursery, Chelsea, have introduced many charming hybrid

FIG. 66.—CYPRIPEDIUM ARTHURIANUM PULCHELLUM.

Cypripediums, and the majority of them will doubtless be extensively grown when well known. Among others, some of which have been illustrated and described in these pages, may be mentioned *C. Arthuriatum pulchellum* (fig. 66). This is a hybrid between *C. insigne* Chantini and *C. Fairrieanum*. In general appearance it resembles *C. Arthuriatum*, but has the addition of

some dark crimson spots in the dorsal sepal. The petals are of a dark bronzy shade, the lip being olive green. A specimen was exhibited at the meeting of the Royal Horticultural Society on November 1st, when an award of merit was accorded for it.

DISCUSSION ON APPLES.

WALTHAM ABBEY SEEDLING.

As I have not grown Dr. Harvey Apple, and have rarely met with it, I am unable to say in reply to "A. B." how far it may or may not be identical with Waltham Abbey Seedling. Those who have both can easily state their opinion. I note that Mr. Bunyard in his Apple list refers to Dr. Harvey as resembling Waltham Abbey Seedling, but he does not say that it is identical. On the other hand it is very suggestive that he does not include the latter in the list some three years old I have here. True, the variety under whatever name known is a splendid Apple, but its chief demerit in the eyes of the trade is that it is not new. I could not but remark that at the Royal Aquarium last week Waltham Abbey Seedling was especially fine in both the first and second prize collections of kitchen Apples. For general usefulness it is worth a score of such kinds as Peasgood's Nonesuch, Emperor Alexander and other showy but very soft-fleshed sorts.

NORTHERN SPY.

Mr. Bunyard said of this variety, "Of no value in this country." That is about the estimate of most who have tried to grow it; yet at the Aquarium Mr. Turton of Maiden Erlegh had a beautiful dish of it in his first prize collection of dessert varieties. It would be interesting to learn how he obtained it in such fine condition. I think it came from an ordinary bush tree on the Paradise stock, but am not certain. It was an undoubted novelty.

UNCTUOUS APPLES.

Will "G. M. S." kindly explain what he means by this term as applied to Apples? To my mind it is a horrid expression, and as fitting as would be sanctimonious. My dictionary tells me that "unctuous" signifies "fat, oily, greasy;" and although most Apples become after keeping somewhat sticky on the surface, yet under no circumstances can I admit that the term unctuous is applicable. Why, if we are to admit that Apples are fat or greasy we may in time be able to convert them into butter or margarine. I do not mind being told that some Apples are glutinous, that we all understand; but the term unctuous seems to savour so much of hypocrisy.—A. D.

BLenheim ORANGE.

SOME notes about Apples planted by our grandfathers and the crops they bear, might be of interest to your readers. The extraordinary crop of 54 bushels were gathered from an old tree of the above at Borde Hill, Sussex, this autumn. The tree, which is practically unpruned, is in excellent health. It is 35 feet high, branches extend 40 feet in diameter, and the stem measures 6 feet 10 inches in circumference 2 feet from the ground. Owing to its size a photograph of it was not very successful. A better one was got of a smaller one of the same sort from which about 30 bushels were gathered, but I am afraid not good enough for an engraving.—R. I.

NAMES OF APPLES.

I HAD the pleasure of inspecting some good samples of Apples the other day, which were the produce of trees planted ten or a dozen years ago. About these, the point I desire to note, is that scarcely any of the varieties were correctly named. If this were a singular case it would not be of much importance; but it is the third instance I have had brought to my notice. In one case every tree was cleared out for the new comers, and a curious mixture they were. How disappointing it must be for any who select kinds from among these to find when fruit is borne that have been supplied with something different from what they wanted.—B.

APPLE HOLLANDBURY.

SOME of the most attractive dishes of Apples I have seen shown this autumn were of this variety. The fruit were large, very clear in the skin, of a rich yellow on the shaded side, and a bright scarlet where more exposed. They were grown in the Avon valley, between Bradford and Bath, the soil being of brashy character. With me on clay the trees thrive admirably, but never bear heavy crops. What fruits are produced usually colour well, while the quality, when cooked, is excellent. In Essex I remember taking note of a number of trees bearing good crops in most favourable seasons, and the attractive appearance of the fruit added considerably to its market value. Both growers for market and exhibitors

ought, therefore, to give Hollandbury a good trial, and in all probability will not be disappointed with it. The season extends from November till March.—I.

THE HEREFORD SHOW.

ONE is glad to read of the Hereford Fruit Show once more, if only to set the "Herefordshire Incumbent" once again to work with his pen. How well I remember two shows held under the auspices of the Woolhope Club before the lamented death of Dr. Bull. At one of them I exhibited Apples for the first time, and actually was awarded two prizes.

A PLETHORA OF VARIETIES.

Now I read that at the Show on November 23rd Mr. John Watkins of Withington, who always runs Messrs. Bunyard so closely at the Aquarium, exhibited no less than 270 plates of Apples. Does this mean 270 distinct varieties? If so, even assuming that cider fruit was included, is it a healthy sign, if the cultivation of the Apple is to be made a national industry, to find so many varieties offered to the public? I am well aware that nurserymen propagate varieties against their better judgment, but so long as their customers demand particular sorts so long, say they, must the demand be supplied. How many varieties are grown in America? Not 270 by any means! The trade in Apples imported from America and Canada is enormous, but mostly Newtown Pippins and Baldwins, surely. Doubtless I shall get into hot water for what I am about to state as my own private opinion, and this is, that if all the nurserymen would combine, a real trades' union, and issue a catalogue comprising but six dozen varieties—say, four dozen kitchen and two dozen table, the cultivation of the Apple as a profitable industry would be considerably promoted. Naturally the list would vary somewhat in the different divisions of the country.

INFERIOR APPLES.

I am glad to find that the Editor of the *Journal of Horticulture* refuses to name Apples of inferior merit. It takes a long time to kill prejudice. There are hundreds of Apple growers all over England who have never been to a fruit show, and who consequently have never seen any fruit other than the sorts their great-grandfathers propagated. Here, in North Suffolk, the culinary Apple is Dr. Harvey; you meet with it in every orchard and garden. It is an excellent Apple, but it only lasts till January. I cannot persuade the growers for market to believe that there can be anything to beat Dr. Harvey. "He suits this district, and this district suits he, Sir; and the crop seldom fails." Another reason for this conservatism I can better understand—viz., that the shopkeepers are shy at purchasing an Apple they do not know. It is only those of us (interested in the subject) who have lived in different parts of England that know of the thousands of worthless nameless Apples that are grown—taking up the same room, equally exhausting the soil as good varieties, and not only failing to make remunerative prices, but which are not even good enough for decent cider.

THE FRUITERERS' COMPANY.

I really think that if the Fruiterers' Company would send round the country a van fitted with trays carrying good samples of our best Apples, and accompanying this van an expert to lecture and give practical advice—visiting on market days the chief centres of agriculture—more practical good would come of such a course of action than the praiseworthy efforts exercised at the last Lord Mayor's Show.

SELECTION OF APPLES.

Before putting down my pen I will give a short list of Apples which we really cannot do without.

Culinary.—Duchess of Oldenburg, Keswick Codlin, Manks Codlin, Ecklinville Seedling, Cellini, Cox's Pomona, Golden Noble, Dr. Harvey, Lord Suffield, Grenadier, New Hawthornden, Peasegood's Nonesuch, Gloria Mundi, Small's Admirable, The Queen, Beauty of Hants or Blenheim Orange (one of these), Bismarck, Lady Henniker, Lane's Prince Albert, Warner's King, Annie Elizabeth, Northern Greening, Bramley's Seedling, Wellington, and Dutch Mignonne.

Dessert.—Irish Peach, Devonshire Quarrenden, Kerry Pippin, Lady Sudeley, Margil or Ribston (one of these), Cox's Orange Pippin, American Mother, Worcester Pearmain, King of the Pippins, Cockle Pippin, Wyken Pippin, Reinette du Canada, Hubbard's Pearmain, Scarlet Nonpareil, Braddick's Nonpareil, Sturmer Pippin, Court Pendu Plat, and Duke of Devonshire.

I have purposely not mentioned some of the newer kinds, which are strongly recommended, e.g., King of Tomkins' County, the Sandringham, Okera, Gascoyne's Scarlet, &c. Moreover, when making my list I have not been forgetful of the merits of Mr. Gladstone, Gravenstein, Melon, Stirling Castle, Frogmore Prolific,

Tower of Glammis, Alfriston, Norfolk Beaufin, &c., some of which may be substituted for any of my list as more suitable for certain localities.—J. A. W.

PROPOSED METHODS OF EDUCATION.

AT very many of our Chrysanthemum shows there is a sectional department devoted to fruit. Here should be an opportunity for giving instruction by means of a lecture previously advertised. Within the charmed circle of the Royal Horticultural Society much has been learned of late years, but it is the great body of gardeners and market gardeners, farmers, tenant and yeomen, who need teaching, and as these cannot go to London shows and meetings, the Royal Horticultural Society and the Fruiterers' Company should send out local lecturers as our two great universities do in the matters of the arts, sciences, and letters.—J. A. W.

[Something of the kind suggested has been done by the Technical Education Committee of the Surrey County Council, both Mr. Alex. Dear and Mr. Edward Luckhurst having attended local shows for the purpose in question, and it would not be easy to find men who could teach more effectively. Lectures and demonstrations have also been given in gentlemen's gardens in Surrey during summer evenings this year to large and appreciative audiences. This garden teaching is directly instructive and enjoyable. There are ladies and gentlemen in all the counties who would gladly grant the use of their gardens occasionally for purposes of instruction, and undoubtedly information of great value to the inexperienced may be conveyed in them by competent practical men.]

CELLINI.

WITH me Cellini has always produced deformed, cracked fruits, and the tree much cankered. The soil is clay gravel on chalk. Now on the Oxfordshire side of the Thames Valley at Boazdown, Whitchurch, Mr. Ashby, the gardener there, called my attention to the rich colour and clean, bright appearance of the fruit and the healthy tree. He had headed down several varieties and regrafted them with Cellini.

BEAUTY OF HANTS.

In view of its density of texture as brought to light by the drying experiments, it seems this Apple is destined to be a much sought after variety. With me it is a good, healthy grower, and seems to come into bearing several years before Blenheim Orange, which it is very much like; not quite so large, but rather more conical.—R. M., *Newbury*.

IRIS DANFORDIÆ.

THE Iris is welcome in all its forms and at all seasons. The massive blooms of the German Iris, the broad flat flowers of Kæmpfer's Iris, the beautiful blossoms of the English bulbous Irises, and the graceful Spanish varieties are all generally welcomed. No less valued are the flowers of the various species which do not come under the above named sections. Where can we find such beautiful flowers as some of the varieties of *I. reticulata*, not to speak of the singularly charming blooms of the *Oncocyclus* section—the despair of most cultivators in this climate? If these flowers, with their varied forms and hues, are prized in the flowery season, how welcome are the species which come in midwinter. Such an Iris is *I. Bakeriana*, such is *I. histrioides*, and the same applies to *I. Danfordiæ*, Mrs. Danford's Iris.

This Iris has come into flower remarkably early, having opened fully on November 23rd. My first bulb, purchased in 1890, met with an unhappy fate, a grub having destroyed it. I replaced it in 1891, but anxiously though I watched for it, no flower rewarded my pains. The bulb, however, flourished, and after its usual summer's rest the leaves began to appear about the middle of September, and after a long lapse of time from the first appearance of the bud I have one flower open and another nearly so, and am now rewarded for my long patience by the sight of this pretty little gem decorating one of my rockeries. This Iris was found by Mrs. Danford on the Sicilian Taurus, and was described so long ago as 1876 by Mr. J. G. Baker in the "Journal of Botany." It has been usually sold under the name of *I. Bornmulleri*, the name of a somewhat similar plant, but larger and even finer. This is also now in cultivation.

In its native habitat *I. Danfordiæ* grows on a sandy slope on the north side of one of the mountains in company with *Crocus vitellinus* and in close proximity to *Primroses*, *Scilla bifolia*, *Fritillaria aurea*, and many other plants. Although it thus appears to have a northern exposure in its native home it by no means follows that this is the most suitable in our latitude. I have my specimen planted in sandy peat on a rockery facing almost south with a point of east in the exposure. Here it seems healthy and

thriving, as it has already increased to two bulbs, each bulb only producing one flower. It grows from 2 to 4 inches in height—my plants being about 3 inches high. The cylindrical leaves are produced before the flowers, but do not attain their full length until after these are past. The flowers are bright yellow, faintly but profusely spotted with a peculiar greenish colour, not unlike that on the flowers of *I. palæstinæ*. The beard is of a darker yellow, and one noticeable point in this Iris is that the three inner segments are almost suppressed, only appearing in the form of three small filaments. It is altogether a distinct little plant and worthy of a place in the choicest collection of bulbous plants. It was exhibited by Mr. T. S. Ware at a meeting of the Floral Committee of the Royal Horticultural Society on February 10th, 1891, and well merited the award it received—a first-class certificate.

The normal flowering time of *I. Danfordiæ* in this country seems to be early in February, but in all likelihood the climatic conditions this season have hastened its flowering. I should like to hear of the experience of others this season. I may say that this Iris was through the soil in the garden of Mr. John Maxwell, Maxwelltown, Dumfries, about the same time as mine appeared; but I have not yet heard if a flower has opened. The plant is perfectly hardy, but in order to prolong the flowering and protect the blooms I have had it covered with a small handlight from the time the bud showed colour.—S. ARNOTT.

IS ROTATION IN CROPPING NECESSARY?

THE old-fashioned system of cropping in rotation has in some gardens been superseded by a less strictly defined method of putting out crops as the ground becomes ready. Formerly ground was frequently vacant, now the crop has often to wait for the ground, consequently it is necessary to depart from a rule of thumb method. Another consideration is that each gardener must be guided to a great extent by the requirements of the family for which he has to provide vegetables. Some sorts must be provided in large quantities and in untimely seasons, while other kinds can be safely allowed to occupy a comparatively small space of ground, and a failure with these is never a very serious affair. But while we should not confine ourselves to a too liberal method of rotation in cropping, it nevertheless presents no good reason why an elastic system of fitting crops one into the other should not find a prominent place in the economical working of a kitchen garden. The plan to please is that which provides the maximum of produce with the minimum of labour and of garden space.

In any method of cropping, too, note must be made of the abnormal demand for flowers which has arisen of late. It is not possible now to depend on borders or beds set apart, as of old, for flowers alone. Chrysanthemums require a fair amount of space. Then we have Arums, Eupatoriums, and other winter-flowering plants, which it is true economy to grow in the open garden. While that is so for winter flowers, spring and summer plants demand extra space. The ground that Tulips, Irises, Daffodils, and early Gladioli require is important. Then for autumn the claims of Gladioli, Montbretias, and Carnations must be considered, along with Roses, Violets, and Lily of the Valley. I find it advisable to provide for each and all of these in the vegetable quarters.

While I follow no hard and fast system of cropping, it occurs in practice that crops fall in to succeed each other with a fair amount of regularity. Thus the quarter which one year is devoted to Broccoli, Cauliflowers, and various kinds of Brassica, is the handiest for the bulk of the Pea crop in the following season. A catch crop of Lettuces, Spinach, or Turnips can be secured off the portion cropped by Cauliflowers, while the later Broccoli is off only in time for Peas. Potatoes frequently follow Peas; winter Spinach and late Turnips succeed Potatoes, and it not infrequently occurs that Celery is ready to take the place of Spinach by the time the latter is ready to be cleared away. Strawberries, as a rule, follow Potatoes. In each of these cases the labour demanded to prepare for a crop is not great.

While the above indicates the general principle I follow, it is an invariable rule that the details of cropping for the ensuing year is mapped out the previous autumn, and the ground, so far as possible, prepared accordingly. Labour and manure by this means are never misapplied. For instance, the particular quarter intended for Potatoes next year requires nothing beyond turning the soil over, and in the process breaking up all clods in the furrows. Ground intended for Strawberry planting in spring on the other hand is double dug or trenched, and a dressing of cow manure at the rate of 40 to 70 tons per acre worked in. If the ground intended for Onions can be had manure is also applied before turning up, but very generally the Onion crop follows Celery, and occasionally it is secured from between the rows of young Strawberry plants. Pea ground is never prepared until wanted, and the

preparation consists in turning out a spit of soil where each row is intended to be sown. Then the soil in this narrow trench is dug over, the Peas sown, and covered more or less deeply according to the time of year. The space between is then dug, and sown with such crops as Spinach, Lettuce, or Turnips, which invariably do best throughout the summer months when sown in freshly dug soil. The later crops of the latter named are sown as Potatoes are lifted, the ground receiving no other preparation than smoothing any irregularities. Although the ground for Cabbages and Cauliflowers cannot be too well worked before planting, I do not favour loosening soil for Broccoli. Neither do these require any manure, though on one occasion I secured a crop by applying such late in the autumn. This particular case was one in which the plants made no growth, and would have been on the whole a failure if a good dressing of manure had not been applied.

Brussels Sprouts are a most important crop with us—small hard sprouts and plenty of them. The ground for these does not require to be dug. Our crop has been grown on the same spot for ten or a dozen years, and in that time only once has the soil been loosened. The method pursued is to set out the young plants in the furrows, thus changing the exact position yearly. An occasional dressing of cow manure is spread over the ground. In some soils this practice might not succeed, but it yields us an unfailing supply of the right kind of sprouts. Leeks have become an important vegetable of late years. The best method with these is to apply a very thick dressing of cow manure to the ground some time in the spring, and to dig this in just deep enough to be out of reach of the roots of the young plants when put out in the summer. Leeks require to be grown quickly in order to be really good. To Celery the same remark applies, and manure must be used in the same way.

In all cases where manure is necessary it is the best plan to apply heavily, say at the rate of 40 tons per acre as a minimum. The after result is that several crops can be taken off the same piece of ground without adding more manure, and in many cases without doing more than loosening the soil sufficiently to allow the young plants to take root. At the same time every gardener ought to have command of fertilisers to apply as required. Superphosphate of lime is the cheapest of all, and in some soils is the only one that it is necessary to apply. A very slight dressing is all that is required to make a notable increase in the size and quality of the crop. For Cauliflowers and Lettuces in early summer, a sprinkling of sulphate of ammonia or nitrate of soda is effective and works wonders in a very short time. No winter crop should be dressed with either of these, at least if necessary they must be applied in the summer, as in the case of Celery which ought to be dressed only when planted. My plan is to get the trenches ready, the manure dug in, and lines drawn off. Then the manure is sown thinly along the surface of the bed to be planted; and in planting out the Celery the manure is sufficiently worked into the ground.

For Celery and Onions I have employed at various times superphosphates alone, and also in combination with sulphate of ammonia; the latter also alone, basic slag alone and in combination with the sulphate. The latter mixture has yielded the best results. The way it is used is to sow the slag flour first and then the sulphate, as the two when mixed run together at once. Where these manures are employed lime is not required. Lime should be employed cautiously, as it destroys the nitrogen stored in the soil. A large amount of caustic lime is present in basic slag, as much as 75 per cent. in some kinds, and this is always more than sufficient for a series of two or three crops. I have had quite as good crops from a dressing such as recommended above as from one of an expensive proprietary manure sown alongside, with the advantage of early ripening of the crop so dressed with the former. A quarter of Onions treated as above will be in first-rate condition for Cabbages. A slight loosening of the surface soil is all that is required to prepare it for the latter crop.—B.

FLORISTS' FLOWERS.

HAVING arrived at the resting period of most hardy florists' flowers, we have time to review the work and experience of the past year, and to formulate our plans for next season. We have about twelve weeks to pass quietly, and then we start again with renewed vigour and determination to excel our past efforts. I am confident that florists' flowers are coming to the fore again. I venture to say the modern school of florists will proceed on broader lines than their predecessors. Take the Carnations, for instance; the border varieties have become very popular. Anyone who saw the last Carnation exhibition at the Drill Hall could not fail to notice this. I have little doubt we shall see the competition improve yearly.

In the Auriculas, again, the popularity of the Alpine classes cannot be denied; their culture is steadily increasing, to the detriment of the show varieties. It is not enough nowadays that a plant is difficult to cultivate, or that everything must be in a subordinate position to mere form, to constitute a florist's flower.

Again, we turn to the Pansy. Who will venture to say this flower is not rising again? The recent formation of a Pansy society for London is sufficient evidence in itself to prove its increasing popularity. I am looking forward to their first exhibition, for I know the future of the society is in the hands of an energetic committee, with the assistance of Mr. G. M'Leod. But will they take up the show Pansy? I fear not, but rather the fancy varieties, with their relatives the Violas. It will be interesting to watch the movements of this society for a year or two. The modern Cactus or decorative Dahlia bids fair to eclipse the show forms in a few years, unless a reaction sets in. As garden flowers they are certainly more suitable for modern tastes and requirements.

One dare hardly draw a comparison between the Chrysanthemums of the past and those of the present. I met an old grower recently who was bemoaning public taste of the present day; he was one of the choice spirits who used to meet at the east end of London with the late Mr. Shirley Hibberd, "Daddy Broome," George Taylor, and others, in the early days of Chrysanthemum growing. He was a successful exhibitor of trained Pompons in his day.—JAMES B. RIDING.

PRICES AND QUALITY OF APPLES.

THE actual price yielded by the fruit from the trees of Domino referred to on a former occasion was 4s. 6d. per bushel. There is a difference between 4s. 6d. and 6s., but there is a still greater one between 4s. 6d. and 2s. Why do we find Apples giving a profitable return in one case but not in another? I write "profitable" advisedly, for 4s. 6d. per bushel is a paying price, and when it is considered that the fruit is gathered from trees growing in an exposed position where few others would succeed the figure reads still better.

Mr. Kruse thinks that Apple growing is only likely to pay the large grower with abundance of capital. This is a most disheartening reflection, for it means that, as in so many other things, special individual skill is to be swamped by large accumulations of wealth. But is so miserable a conclusion justifiable? Emphatically no. One of the largest fruit growers in Kent told me a few weeks ago that too many Apples were being grown, that they hardly paid now, and that in a year or two, with planting going on at its present rate, there would be gluts of fruit, and heavy losses. As illustrative of his remarks, he stated that this autumn such leading varieties as Ecklinville, Stirling Castle, and Lord Grosvenor had only brought 2s. 6d. a bushel, and at such a price it would not pay to invest any labour on pruning, manuring, and other cultural matters. So far some justification of your correspondent's conclusion. But compare it with the report of another grower; and, mark this, a grower with not a sixth of the land under his management that the other has. No. 2 has secured 6s. per bushel average price for Ecklinville, Lord Grosvenor, Stirling Castle, Mank's Codlin, and others, the varieties including the same as in the other case.

Again I ask, Why the difference? The soil may not be quite the same, despite the fact that the two farms are not far apart; but so far as my observation goes, the one is favoured just about the same as the other. We must therefore look beyond that. It is methods of culture that explain the extraordinary variation in the returns. The one grower thinks he cannot afford to give the trees any attention, notwithstanding the fact, which is well known, that his working capital is large. The other does afford it. His trees are models of admirable management. They are pruned on the simplest of all systems—that of restricting them to a few widely disposed branches, thinning-out instead of cutting back the superfluous growths. The cost for labour in this direction is small, for the work is straightforward, and is quickly done. Light and air have free access to the trees, and their growth is sturdy, firm, and well matured. Then prompt and efficacious remedies are applied for keeping insects in check. In this respect, as in others, an endeavour is made to keep abreast of the times, and every new discovery is fairly tried. Turning to the soil, its treatment is such that the 100-acre farm resembles a huge garden. Weeds and noxious growths are kept down, the surface of the soil is stirred to facilitate the ingress of air, check the too rapid evaporation of moisture, and disturb lurking grubs. Last, and perhaps most important, judicious feeding is practised. Trees that are well weathered have an increased tendency to fruitfulness from the harder and better ripened character of their growth as compared

with crowded examples, and their energies are supported by timely top-dressings. Late in winter a dressing of kainit and superphosphate, spread from the stem of the tree outward to the utmost expanse of the branches, is applied, and when the fruit is set a light sprinkling of nitrate of soda follows. Thus nourished, experiment has proved that trees will carry a much heavier and finer crop to perfection than those which—from negligence, ignorance, or false motives of economy—are left without special support. Few fruit growers on a large scale think it worth while to feed their trees systematically, but they rarely omit to grumble at low prices. Ask the farmer himself to work hard without food, and he would put you down as either a madman or a fool; but he thinks himself neither mad nor foolish in expecting his trees to do the same thing.

I come, therefore, to the point of my title, "Prices and Quality" of Apples. They are closely allied. It is useless to talk about low prices when no systematic and complete attempt is made to improve quality. Properly managed and properly fed trees will yield large and finely-coloured fruit. Neglected and badly nourished trees will yield poor examples. The one is the 4s. 6d. and 6s. per bushel tree; the other the 2s. and 2s. 6d. per bushel one. These words are not written vaguely and without knowledge. They could be supported by equally cogent cases—not hypothetical, but hard incontestable facts—if it were necessary. The lesson of excellence is written in large and bold characters on every instance of success. Whether the old-world growers recognise it or not does not matter—except to themselves. An intimate insight into the methods that are pursued and their results enable a ground to be taken up with respect to hardy fruit-growing for profit that no idle speculations as to accumulations of capital can shake. Let the big men accumulate their capital as they will, they cannot make trees bear profitable crops without managing them properly. Goulds and Astors may be possible in millionaire-ridden America, but fruit growers here need not fear them. If the smaller men will but cling tenaciously to the rock of quality they need not shrink from the encounter with others who save money by shirking good management and spend it on mere increase of numbers, for this will only multiply the bushels of poor fruit which find their way into the market, leaving the same opening for high-class fruit that there has been, is now, and always will be.—W. P. W.

ADIANTUM FARLEYENSE.

SINCE several of your correspondents are giving their experience of the above beautiful Fern, perhaps you will allow me space to describe a pair which I have here. Some five or six years since I had a magnificent specimen. It was then in a pot 36 inches in diameter. The plant measured 7 feet in diameter, and it took first prize and a medal at a local show. Finding a difficulty in accommodating it, however, I reluctantly split it into a number of pieces, which were placed in pots varying from 4 inches to those of 7 inches in diameter. The following year two of the most promising of these were selected and placed in 9-inch pots. I may state that by way of experiment one of these was potted in turfy loam and sand exclusively, the other being placed in peat, loam, leaf soil, and sand in about equal proportions. In other respects they have been treated exactly alike.

The following year they were removed to pots 12 inches in diameter, the plant growing in loam being placed in similar material; the other plant was also potted as before. Of the two plants, that growing in loam is the finer; the fronds are a little larger, and of a deeper colour when fully developed, and of more delicate rose colour when in a young state. As regards the difference in the size of the plants there is not much to choose. They are very fine, measuring a little under 5 feet each, and are greatly admired by all visitors to these gardens.

There are two things this Fern has a decided objection to—viz., water impregnated with lime and which has not been exposed to the sun, and being potted in peat of bad quality exclusively, which is often done. Where peat of really good quality cannot be obtained I would certainly use turfy loam and half-decayed leaf soil.

This Fern has a decided preference to cow manure in a liquid state. Where the water is charged with lime it should be exposed to the sun for some days before it is applied. I may say that these plants are looked over two or three times each year, and the dead and dying fronds taken away and staked out in order to give light and air to the young growth.—T. ARNOLD, Cirencester House.

I CAN fully endorse, from my own observation and cultivation, the remarks of your correspondents, in which they state how much better this beautiful Fern succeeds in a compost in which good fibry loam forms the chief ingredient; and more especially the note by "J. J. C." (page 478), for having seen the healthy plants that he grows I am able to bear him out as to the compost recommended. It is astonishing how difficult it is to try to restore plants after once getting into a bad condition, and I am certain that with careful crocking of the pots—for this is very essential to the well-being of this Fern—and loam used in

preference to peat, that success will very much sooner be attained, for in the latter the fronds never seem to get the same vigorous texture. I have for some years past grown a large plant, which is now some 4 feet across, in the early vinery, the shade in the summer being just sufficient to give the fronds a very pleasing shade of green. I never syringe it, but am never afraid of giving it copious supplies of water when necessary, for I know of no Fern that suffers so quickly if allowed for once to become dry at the roots. The compost used consists of three parts loam with all loose soil shaken out and one of good leaf mould with sufficient red sandstone broken up into small pieces and silver sand to keep the whole porous. I have had plants which have done remarkably well in an intermediate temperature.—R. P. R.

COLOUR IN VINE LEAVES.

I HAVE always been struck with the beautiful colouration the Vine foliage puts on here upon the approach of autumn; and although we try to supply the Vine's wants as far as lay in our power, yet I am not of the same opinion as Mr. Dunkin that this said colouration is due to cultural treatment alone. For a case in point. Mr. Buchanan states that with him Alicante does not colour at all, at least not in the same sense as we mean by colouring. Now with me this variety colours beautifully, the harmonious blending of crimson, green, and yellow being most beautiful. I have gathered a number this season off the sub-laterals for garnishing fruit. In the gathering I noticed that where one leaf partially covered another there the crimson colouration was void. Lady Downe's and Mrs. Pince's Black Muscat also colour very prettily. The palm, however, for very rich colouring must be awarded to Madresfield Court grafted on Black Hamburg. The leaves of this are of a brilliant crimson colour. This season I was nearly losing a number of the primary leaves. A lady had noticed them, and had already culled a number of them, they looked so pretty for church decoration at the harvest festival.—A. YOUNG, Abberley Hall.

Mr. D. BUCHANAN (page 455) writes on the high colouration their Vine leaves have attained, and asks what can be the cause of it. Would Mr. Buchanan let us know if he has observed if the autumn tints of deciduous trees are brighter about Kippen than anywhere else he has been? The soil above the 50 feet old sea-beach about Kippen is overlying the old red sandstone formation and is very much impregnated with iron, which gives the stone a bright red colour. The soil is also reddish in colour. Where no rock is near the surface the subsoil is in most parts a reddish till. May not the iron which the soil contains have something to do with the colouration of the Vine leaves? Would Mr. Abbey say whether soil highly impregnated with iron—as I take the Kippen soil to be by its colour—gives a richer tint to maturing foliage than soil with only slight traces of it?—G. McDUGALL, Stirling.

A CORRESPONDENT writes:—"Mr. Dunkin's conclusions (page 487) in regard to colour in Vine leaves are at variance with both theory and practice. Enclosed are three leaves picked up under Vines, recently planted in two new vineries, of Gros Colman, Madresfield Court, and Alnwick Seedling. The Vine eyes were put in over a year ago, so that all have had the same treatment up to the present, yet some of the best Vines have shed their leaves without rich colouring."

[The last sentence is printed exactly as it was written; it appears somewhat incomplete, as all the leaves are highly coloured.]

DOUBLE CHINESE PRIMROSES AT LEATHERHEAD.

I FEEL it is safe to aver that there are very few places in the kingdom where double Chinese Primroses are better grown than at Leatherhead, Surrey. I confess that to me the finely flowered plants of these beautiful winter flowers, which were shown at that place last week, were a surprise. I believe these plants are shown well at Birmingham, but here they were done well also by comparatively small gardeners, who certainly do know how to grow them in first-class form.

The recent Show evidenced this, for there is in the schedule a class for six plants, and Mr. Peters, a gardener in the town, was placed first, as I learn he always is. Another gardener (Mr. Mileham) ran him very close; and Mr. Mease had capital plants also. The first-prize six plants, all being in 6-inch pots, were from 15 to 16 inches across, and very dwarf, at least not more than 7 inches in height. They carried each from eight to ten trusses, and expanded blooms in number from fifty to sixty. They were all of the pure white variety White Lady. Why, when this large-flowered sort can be grown so well, we should hear so much of the relatively poor-flowered old double white it is hard to understand.

Mr. Mileham's plants included one of the deep flesh tinted Annie Hillier, the rest being White Lady. These were as large and as fully flowered, but were not so compact as were Mr. Peters's plants. Mr. Mease's six included three plants of Marchioness of Exeter (the finest though not quite the purest double white), and the rest White Lady. They were only placed third because not quite so early, but a few weeks hence they will be fine plants. There seems to be no particular difficulty found in growing these double Primroses. They are the products of spring-rooted cuttings, grown on in pots during the summer. Allowing that each good plant will carry 100 blooms during a winter season, it is obvious that the returns for these should be considerable and very profitable, especially that of White Lady, the flowers are so large and so enduring.—A. D.

EVENTS OF THE WEEK.—The Committees of the Royal Horticultural Society will meet at the Drill Hall, James Street, S.W., on Tuesday, December 13th, and a lecture on "Winter Berry-bearing Plants" will be given at the afternoon meeting. On the same day the annual meeting of the National Rose Society, also the monthly dinner and conversazione of the Horticultural Club, will take place. Particulars are given elsewhere.

— **THE WEATHER IN LONDON.**—The weather has been of a wintry nature in the metropolis during the past week. Sunday opened bright, but very cold, with a sharp frost at night. Monday was also fine and seasonable, and a slight fall of snow occurring in the evening. On Tuesday snow fell at intervals during the day, turning to rain at night. Early on Wednesday morning slight frost was apparent, and at the time of going to press it is clear, though not quite so cold.

— **WEATHER IN THE NORTH.**—From the 30th ult. to the 6th inst. has been a week of severe weather. On the morning of the 1st the ground was covered with 5 inches of snow, which still lies but little affected by the sun. The consecutive record of frost from the last day of November is 8°, 7°, 23°, 21°, 15°, 16°, 15°. The cold on the 2nd was intense. There was a slight thaw for a few hours on Saturday, but after noon frost again set in keenly.—B. D., *S. Perthshire*.

— **GARDENERS' ROYAL BENEVOLENT INSTITUTION.**—A general meeting of the members of the Institution will be held at Simpson's, 101, Strand, in the county of Middlesex, on Tuesday, the 20th day of December, 1892, at three o'clock in the afternoon, for the purpose of passing a special resolution to change the original name of the Institution from "the Benevolent Institution for the Relief of Aged and Indigent Gardeners and their Widows" (instituted in 1838) to the name of the Gardeners' Royal Benevolent Institution, by which it is now generally known, for the purpose of registration; and also to consider and adopt alterations and additions to the rules of the Institution, recommended by the Committee of Management.—GEORGE J. INGRAM, *Secretary*.

— **HORTICULTURAL CLUB.**—The usual monthly dinner and conversazione will take place on Tuesday next at the rooms of the Club, Hotel Windsor, Victoria Street, Westminster, at six o'clock. The chair will be taken by Harry J. Veitch, Esq., Vice-Chairman of the Club. The discussion will be on growing the Chrysanthemum for exhibition, and will be opened by the Worshipful the Mayor of Taunton, Mr. W. Herbert Fowler, winner of the champion challenge cup of the National Chrysanthemum Society.

— **MEETINGS AT THE DRILL HALL.**—Allow me to cordially support the suggestion for altering the commencement of the afternoon meetings to 2.30 at least, 2 P.M. for preference. Very few of the lectures attract a good audience, and it is within my certain knowledge that many visitors leave before 3 P.M., unable to wait until that hour. If the general public came in during the afternoon in sufficient numbers to make a good meeting all would be well, but they do not.—ANOTHER FELLOW.

— **ROYAL BOTANIC SOCIETY.**—At a meeting of this Society, held on November 26th, John Birkett, Esq., F.L.S., in the chair, Mr. C. E. Anquetil, Mr. J. L. Ellis, Dr. Seton, Mr. John Thompson, Mrs. F. Adams, and Mrs. Phillips were elected Fellows of the Society. Some beautiful paintings by Miss Bertha Maguire of Chrysanthemums in the Society's conservatory were exhibited at the meeting, and highly commended by the Fellows present for their fidelity to Nature. The exhibitions and meetings of this Society will be held in the Gardens, Regent's Park, during 1893 as follows:—Spring Shows, March 22nd and April 26th; Special Floral Fête, June 21st; Evening Fête, July 5th; Musical Promenades on the Wednesdays in May, June and July, exhibition and fête days excepted. Lectures will be given on Fridays in May and June at 4 o'clock. General meetings for election of new Fellows and scientific discussions will be held on January 14th and 28th, February 11th and 25th, March 11th and 25th, April 8th and 22nd, May 13th and 27th, June 10th and 24th, July 8th and 22nd, November 11th and 25th, and December 9th. The anniversary meeting takes place on August 10th.

— **SALE OF PLANTS AT BLENHEIM PALACE.**—The whole of the contents of the greenhouses and hothouses at Blenheim Palace—plants of every kind, and no fewer than 25,000 Orchids—are to be sold by auction on December 19th and the following day by Messrs. Protheroe and Morris.

— **THE HORTICULTURAL DIRECTORY.**—This annual is now ready. It is the thirty-fourth issue, and contains 480 pages of matter of interest to gardeners, amateurs, and the great community of persons who are engaged in the industries of and in close alliance with horticulture. The changes in gardening appointments are numerous, and were recorded up to date; but, as is inevitable under the circumstances, many arrived too late to be inserted. As a handy work of reference the "Year-Book" will be found to maintain its established reputation, and the price remains as before—1s.

— **CROCUSES IN NOVEMBER.**—I think it only right that I should state that when I wrote the article on "Crocuses in November," which appeared in the Journal of 1st inst., I was not in possession of the supplementary part of Nicholson's "Dictionary of Gardening." I have since received it, and find that it gives an admirable key to the genus and descriptions of most of the recent introductions. *C. zonatus* is, I find from the above work, a native of the Cilician Mountains and Lebanon, and *C. hyemalis* of Palestine and Syria. The *C. hyemalis* in my garden is *C. h. var. Foxi*, which differs from the type in having black instead of orange anthers.—S. ARNOTT.

— **CHICAGO EXHIBITION.**—In reference to the announcement at page 483, we are informed that Mr. McIndoe is not the only English gardener who has been invited by the "Executive of the above Exhibition to exhibit at their great Show next autumn a collection of fruit similar to the one staged at the International Horticultural Exhibition held at Earl's Court, London, last August." Messrs. Goodacre, H. W. Ward, and other successful exhibitors at Earl's Court were also "specially" invited by Mr. J. M. Samuels (Chief of the Department of Horticulture, Chicago), in language identical to that quoted above, the letters of "special" invitation being dated September 17th, and received ten days later.

— **THE HEREFORD FRUIT SHOW.**—A correspondent writes:—"Your reporter, in giving the account of the Hereford Fruit Show, is slightly in error when he states Mr. Lee Campbell to have taken most of the prizes in the amateur class. For thirty dishes of Apples, open to Herefordshire, Mrs. Evans, Moreton Court, was first, the English Fruit and Rose Company second, the Right Hon. Lady Emily Foley third. For twelve dishes of Pears Mr. Lee Campbell was first, Mrs. Evans second; and for twelve dishes of Apples, best for market purposes, Mrs. Evans was first, Mr. Lee Campbell being second. For single dishes in the open class Mrs. Evans took three seconds and three thirds. I shall be obliged if you will insert this in your next issue." The word "indoor" in the report ought to have been printed "out of doors."

— **BRISBANE BOTANIC GARDEN.**—A correspondent of a daily contemporary writes that trees from all parts of the world may be seen growing luxuriantly in this beautiful garden. One may walk in the avenue of Bamboos or sit beneath the shade of a beautiful Palm, Fig tree, or majestic Fir, and take in a view which time will scarcely efface. All around are beautiful flowers of every hue and climate, and trees of almost every kind. There is the Banana tree, the Papan Apple, the Fig, Cypress, Pine, Bamboos, Palms, Bottle-tree, Gums, Eucalypti, and trees from America, India, China, England, Japan, and many other countries, always green, always beautiful. The walks are well planned, and the ferneries are pictures of loveliness. Here are noble Tree Ferns, rich Orchids, luxuriant varied climbers, Begonias, beautiful Maidenhair Ferns, Dracenas, and Lilies.

— **BIRMINGHAM GARDENERS' ASSOCIATION.**—At a meeting held on November 28th, Mr. W. Crump, Madresfield Court Gardens, Worcester, read a practical paper on "The Apple and its Culture," and exhibited specimens of 100 varieties grown at Madresfield in the experimental garden. Much useful information was given as to root-pruning and planting. Excellent samples of culinary Apples were exhibited, also several local varieties of considerable promise. Mr. Hughes, the Secretary, exhibited a very fine specimen of *Cypripedium* insigne fully 3 feet in diameter and well flowered, which had been growing in the same tub for several years, and a cultural certificate was awarded. Mr. R. W. Vertegans also obtained a similar award for *Romneya Coulteri* in bloom—a deliciously scented hardy plant. He also exhibited a dish of fruit of *Diospyros Kaki*, but not ripe enough to eat. It is not very unlike a medium-sized Tomato in form and colour.

— GARDENING APPOINTMENT.—We learn that Mr. T. Humpheys of the Royal Gardens, Kew, has been appointed Assistant Superintendent at the gardens of the Royal Horticultural Society, Chiswick.

— BRAZILIAN EXHIBITION IN PARIS.—It is stated that an Exhibition of Brazilian Orchids and other products will be opened in Paris under the superintendence of Viscount de Saint Léger in April.

— NATIONAL ROSE SOCIETY.—The annual meeting will be held, by permission of the Horticultural Club, at their rooms, Hotel Windsor, Victoria Street, on Tuesday next. The chair will be taken at three o'clock by the Very Rev. the Dean of Rochester, President of the Society.

— IMPORTATION OF POTATOES.—The Potatoes imported into the United Kingdom in the week ended November 15th, 1892, amounted to 98,170 cwt. In the corresponding month of 1891 to 21,023 cwt. According to this statement it will be seen that the importation of Potatoes, as well as fruit, is on the increase.

— DEVON AND EXETER GARDENERS' ASSOCIATION.—Messrs. R. Veitch & Son, Exeter, exhibited some well-grown Bouvardias at the last meeting of this Association, which was held on the 30th ult. Mr. J. Payne read a paper on "The Cyclamen and Bouvardia," the substance of which is printed elsewhere in the present issue.

— GARDENERS' MUTUAL IMPROVEMENT SOCIETY, WOOLTON.—The members of this Society held their usual periodical meeting in the Mechanics' Institute recently, when there was a good attendance present to hear a paper on the "Culture of the Bouvardia," by Mr. J. Glover. The essayist gave a lucid and thorough system of the cultivation in which to ensure good plants to produce at this season an abundance of flowers.

— WELL-GROWN EUCHARIS PLANTS.—The note by Mr. J. Ashton (page 483) reminded me of a fine batch of healthy and well-grown plants which I lately saw at Hill Grove, Kidderminster. I have seen the same plants during the past few years, and they were always clean and healthy and beautifully flowered. No Eucharis mite appears to trouble them. They are never plunged, but grown on the stage of the plant stove.—A. Y.

— TREE PLANTING IN IRELAND.—The Irish Land Commission, encouraged by the success of their operations in this work last year on the west coast of Ireland, have been induced greatly to extend the woodlands in that exposed district, and are importing large quantities of young forest trees from the principal nurseries in this country. Messrs. Little & Ballantyne, Carlisle, inform us that they have among others, been requested by the Board to furnish a large consignment from their nurseries, from which the plants taken last year for experiment have succeeded so well.

— COUNTRY FRUIT MARKETS.—Mr. Hiam's complaint as to "Green Gage Plums rotting on walls in the rural districts for want of a market certainly makes one's mouth water. Still there is very much of force in his reference, because country people constantly have cause for complaint that it is far easier to purchase fruit in towns where it is not grown than in the country where it is. That arises from the general tendency to send everything worth eating to some town market. But how is it that those who have Green Gage Plums that find no local market do not obtain some small shallow deal boxes, holding about 12 lbs. each of fruit, line them with tissue or blue crown paper, pack the fruit in carefully in about three layers, fix the lid securely, and then send them to some good town market for sale? In that way they would give a good return.—A. D.

— ANTIRRHINUMS FOR BEDDING.—I can fully endorse Mr. E. Molyneux's remarks on page 488; but in addition to propagating the Antirrhinum by cuttings this charming florists' flower can be most successfully treated as an annual. The seed should be sown in the early part of February in a box 4 or 5 inches deep, covering the box with a sheet of glass. In a fairly warm house the seed will not be long germinating, and a beautiful early and late autumn display is insured. Cuttings may be taken from the best. Two or three years ago I saw a beautiful bed of Snapdragons in a garden in North Kent. The seed had been sown in the open in the spring with a view of making a ribbon border. I was astonished at the result. The colours came true, sufficiently so at any rate for the purpose, and the dwarf habit, about 8 or 9 inches, very constant. The seed came in distinct colours from Messrs. Sutton & Sons of Reading, and was evidently the result of patient selection.—J. A. W.

— FRUIT PRESERVING.—We understand that, on the occasion of the Astwood Bank Chrysanthemum Society, Mr. J. Hiam, our esteemed correspondent, read an article on fruit preserving from the *Journal of Horticulture*. Mr. Hiam supplemented the article by giving particulars of his own experiments of fruit preserving by evaporation, a method which he considered might be profitably applied in times of plenty.

— A GIGANTIC CAMELLIA.—According to the "Garden and Forest" a remarkably fine Camellia is growing near the Royal castle at Pillnitz, Dresden, Germany. The tree is 24 feet high, and produces annually at least 50,000 blossoms. It is supposed to have been imported from Japan about a century and a half ago. It is planted in the open ground, but every winter a structure of boards is built around it to protect the plant from the severe cold of winter and the blooms from rains and frosts.

— A GARDENER'S INVENTION.—The problem of the steering of balloons is said to have been solved by a Hamburg gardener, who has been engaged on the problem for twelve years past, and about a year ago constructed a balloon which he claims will fulfil all the required conditions. His name (says the Berlin correspondent of the *Standard*) is Carl Theodor Geissler. We shall be glad to hear of his flying to the Chicago Exhibition, and of his getting safe home again in his aerial machine.

— MANCHESTER BOTANICAL AND HORTICULTURAL SOCIETY.—The Exhibitions of the above Society will take place next year on the following dates:—At the Town Hall, March 14th, April 25th; special grand Exhibition of Orchids and artistic groups of plants, to open on May 19th at the Gardens; Rose Show at the Gardens, July 22nd; Chrysanthemum and Hardy Fruit Show, November 21st and 22nd. The National Tulip Society's Show, and the Carnation and Picotee and Pink Society's Exhibitions will also take place at the Gardens; the dates will be fixed a little later.

— MEALY BUG ON VINES.—I shall feel much obliged if "R. R., Belfast" (page 433), will state what dressing he used on his Vines to eradicate the insects in so short a time. I have a house of Lady Downe's Seedling infected with mealy bug, and have been trying these last five years to clean it, but each year I have several bunches spoiled owing to "honeydew" settling on the berries. I may state the house is thoroughly washed each year and the Vines scraped and painted; also I have the Vines examined every ten or fourteen days, and each insect destroyed with petroleum.—NEMO.

— FLOWERS FROM THE ISLE OF WIGHT.—Those who reside in the Isle of Wight are fortunate people so far as experiencing favourable weather is concerned. Writing under the date December 1st, Mr. G. Wilkins, Castle Gardens, St. Helens, says:—"I send you a box of flowers, all of which were cut this morning from the open borders, to show the mildness of the weather in the Isle of Wight." The flowers were bright and fresh, and comprised, among others, Dahlias, Zonal and scented-leaved Pelargoniums, Fuchsias, Marguerites, Stocks, Ageratum, Antirrhinum, Schizostylis coccinea, Tea and Monthly Roses.

— THE WAKEFIELD PAXTON SOCIETY.—The subject for discussion at the recent meeting of this Society was "Orchid Collecting and Importing," and a magnificent and varied display of Orchids were placed on the table. The lecturer was Mr. R. Eichel, of the firm of Messrs. Charlesworth, Shuttleworth, & Co., Orchid Nurseries, Heaton. Mr. Eichel imparted much interesting and valuable information to his hearers. He pointed out that great sums of money are expended in sending out collectors to different parts of the world in search of Orchids, and he showed that the collectors have to be men possessed of much pluck, perseverance, patience, and self-reliance. They have also to endure great hardships and disappointments in their travels and dealings with the natives in remote regions, and great care is required in packing the plants in order that they may be preserved in the voyage to England. A number of photographs sent or brought home by the collectors tended to confirm some of the lecturer's statements. Mr. Joshua Harrap of Horbury proposed a vote of thanks to the lecturer, who, he said, is connected with one of the best firms of Orchid importers and dealers in this country. Mr. Harrap dilated on the great beauty of Orchids and their long blooming period, and expressed it as his opinion that many of the gentry in that district (Wakefield) make a mistake in not cultivating Orchids more extensively. Ever since he became an Orchid grower he had been delighted with the magnificent blooms produced by the plants. Mr. T. Garnett seconded the motion, and remarked that Orchid growing was yet in its infancy in this country.

— **SMALL HOLDINGS IN LINCOLNSHIRE.**—Mr. Henry Chaplin, M.P., who recently offered a large farm in North Lincolnshire to the Lindsey County Council for the purpose of providing small holdings, has offered to the Kesteven County Council (South Lincolnshire) a farm of 657 acres for similar purposes at Temple Bruer, near Sleaford.

— **NATIONAL AMATEUR GARDENERS' ASSOCIATION.**—The monthly meeting of this Association was held at the Memorial Hall, Farringdon Street, E.C., on Tuesday, December 6th. Mr. T. W. Sanders presided, and there was a fair attendance of members. A paper on "Irises," by Mr. E. T. Cooke, was read by the Chairman, a discussion following. As briefly announced in our last issue, the annual dinner of the Association will take place at the Holborn Restaurant on Tuesday, December 13th, the President occupying the chair. Mr. D. B. Cranc, 4, Wood-view Terrace, Archway Road, Highgate, is the Hon. Secretary.

— **DEATH OF MR. JOHN DOWNIE.**—With deep regret we record the death of Mr. John Downie of Princess Street, Edinburgh, and Beechill Nursery, Murrayfield, which occurred on the 25th ult. Mr. Downie was a noted Scotch florist, and few horticulturists in Scotland were held in higher esteem. During the past half century the name of Mr. John Downie has been prominent before the horticultural world, and to his assiduity gardeners owe much. He was the originator of the now popular Fancy Pansy. Mr. Downie served his apprenticeship at Canaan House, and succeeded his father as head gardener at South Bank, Edinburgh. For many years he was a partner in the firm of Downie, Laird & Laing, and subsequently started in business by himself. We understand that the business will be carried on by his son. His remains were interred in the Grange Cemetery on the 29th ult., in the presence of many sorrowing friends.

— **BRUSSELS SPROUTS.**—All round London the green crops are in first-rate condition and wondrously plentiful; they have rarely been cleaner or in better form. Very likely we shall soon hear of Savoy Cabbages, Coleworts, and Kales being gluts. But not only have Cauliflowers, the traditional "white head" of the markets, been good and very plentiful, but they have sold very well. There has been hardly a night's check to them since they first began to turn in. After all there are none of the Brassica family that pay so well as do Brussels Sprouts. These are remarkably good and as clean as can be. The plants grown on the hard and not too rich soil in the fields produce splendid stems of sprouts, all hard, green, and delicious; not too large, yet very firm. There seems, after all, to be no Brussels Sprouts like those that are field grown; and gardeners, as a rule, would find more satisfactory results if they would plant in less rich soils.—OBSERVER.

— **WEATHER AT LIVERPOOL.**—For the past few days the weather here has been of a very wintry character. After a period of weather remarkable for its mildness, we were visited on the night of the 30th ult. with a slight fall of snow, the thermometer standing at 16°. Since then severe frosts, hailstorms, cold rain, and more snow, which commenced on Sunday, December 4th, and lasted all Monday, have been the order. The thermometer on the 2nd was 20°; 3rd, 24°; 4th, 20°.—R. P. R.

— **OBSERVATION OF THE WEATHER DURING NOVEMBER, 1892.**—The weather during the past month has been of a mild character. Dull sunless days were numerous, also plenty of fogs. The rainfall was lighter than it has been for the corresponding months of the past two years. Through the mild weather grass and other things have been growing very freely. Rain fell upon thirteen days. Maximum amount in any twenty-four hours was 0.35 inch on the 15th; minimum amount was 0.02 inch on the 7th. Total during the month, 1.75 inch against 2.36 inch of 1891.—E. WALLIS, *The Gardens, Hamels Park, Buntingford, Herts.*

— **THE WEATHER DURING NOVEMBER AT RIPLEY, YORKS.**—This was a very dull month, only two bright days occurring—i.e., 29th and 30th. The rainfall was light, but owing to the prevalence of fog and the absence of wind the ground was (from the heavy rainfall in October) in a more or less saturated state during the greater part of the month, thus not favourable to planting operations. Rain fell upon eighteen days—total, 1.68 inch, of which 0.41 fell on the 4th. Frost was registered on fourteen days. Mean reading of the barometer, 30.05°. Mean maximum temperature, 48.1°; mean minimum temperature, 32.1°. Mean temperature of month, 40.1°. Highest maximum temperature, 56° on 5th; lowest minimum temperature, 18° on the 2nd.—J. TUNNINGTON, *Ripley Castle Gardens, Yorks.*

— **RAINFALL IN SUSSEX.**—The total rainfall at Cuckfield for the past month was 3.80 inches, being 0.13 inch above the average; the heaviest fall was 0.108 inch on the 16th. Rain fell on seventeen days. The maximum temperature was 56° on the 14th; minimum, 33° on the 2nd; mean maximum, 48.2°; mean minimum, 41.2°; mean temperature, 44.70. A mild, almost sunless month, the partial shade readings being 3.4° above the average.—R. I.

— **THE WEATHER IN KIRKCUDBRIGHTSHIRE.**—The weather during the past week has generally been of a wintry nature. We had about half an inch of snow on the night of the 2nd inst., but this nearly disappeared during the following day. On the night of the 3rd about 2 inches of snow fell, and as frost has succeeded it still remains on the ground. The depth of snow is considerably greater further from the sea. To-day (5th) is bitterly cold.—S. ARNOTT.

— **INTENSE FROST IN STIRLINGSHIRE.**—The end of the past week was very wintry. In a few days as much snow has fallen on the low grounds as fell altogether in the winter of 1891. On Thursday afternoon (December 1st) the frost set in very intense, and at 4.30 the thermometer indicated 15°; it gradually fell, until at ten o'clock 22° were registered. On Friday morning at seven o'clock it was standing at 7° (25° frost); the mercury slowly rose until midday, when it stood at 20° (12° of frost). It fell very rapidly towards 3.30, and at 4 P.M. it was down to 8° (24° of frost).—C. MCDUGALL.

— **SUMMARY OF METEOROLOGICAL OBSERVATIONS AT HODSOCK PRIORY, WORKSOP, NOTTS, NOVEMBER, 1892.**—Mean temperature of month, 42°; maximum on the 14th, 57.6°; minimum on the 2nd, 24.2°; maximum in the sun on the 3rd, 98.4°; minimum on the grass on the 1st, 19.6°; mean temperature of air at 9 A.M., 41.9°; mean temperature of the soil at 1 foot deep, 44.1°. Nights below 32° in shade, seven; on the grass, sixteen. Total duration of sunshine, forty-two hours, or 16 per cent. of possible duration; we had fifteen sunless days. Total rainfall, 1.01 inch; rain fell on twelve days. Average velocity of wind, 7.1 miles per hour; velocity exceeded 400 miles on three days, and fell short of 100 miles on fifteen days. Approximate averages for November:—Mean temperature, 23°; sunshine, fifty hours; rainfall, 2.03 inches. This month was dry and dull, with very little cold weather.—JOSEPH MALLENDER.

— **THE WEATHER LAST MONTH.**—November was exceptionally dull and foggy. The sun only appeared on twelve days, and then for a short time on some of them. We had two clear days. The barometer was very changeable. The highest reading was 30.40 at 9 A.M. on the 22nd; lowest 29.59 at 9 A.M. on the 3rd. Total rainfall, 0.93 inch; which is 1.73 inch below the average for the month. The greatest daily fall was 0.20 inch on the 2nd. Rain was recorded on fourteen days. Highest shade temperature 57° on the 4th and 14th, lowest 28° on the 2nd, lowest on grass 22° on the 2nd; mean of daily maximum 49.2°; mean of daily minimum, 37.7°; mean temperature of the month, 43.4°. The wind was in a westerly direction twenty days, but was very light all through the month. The mean relative humidity as taken daily at 9 A.M. (taking saturation equal to 100) was 95.6. The garden spring ran 20 gallons per minute on the 30th. The majority of the trees were bare of leaves by the 13th.—W. H. DIVERS, *Ketton Hall Gardens, Stamford.*

— **THE CORBRIDGE AND DISTRICT GARDENERS' MUTUAL IMPROVEMENT SOCIETY.**—The monthly meeting of the above Society was held in the Town Hall on November 28th, Mr. Oliver presiding. There was a fair attendance of members. In the unavoidable absence of Mr. Charlton, Farnley Grove, a paper prepared by him upon the "Gardeners' Mutual Improvement Societies: their Aim and Object," was read by Mr. Thompson, Farnley Grange. Mr. Charlton dealt with his subject in an able manner, and made some good suggestions. He remarked that Societies might offer prizes for essays on horticultural subjects, and pointed out the advantages to be gained by so doing. He strongly advised young men to avail themselves of every opportunity to gain knowledge of the profession they adopted. A very interesting discussion followed, in which the Chairman, Mr. Bell, Mr. Brown, and Mr. Irvine especially took part. A hearty vote of thanks was passed to Mr. Charlton for his most interesting paper. A similar vote to the Chairman and reader of the paper terminated the proceedings. The Society has already received support from some of the leading gentry in the district, and several others have kindly promised subscriptions. The total sum received by the Secretary, Mr. T. Ridley, Dilston, Corbridge, is £9 1s. 6d. There are over forty members.

SENNOWE, NORFOLK.

THIS fine old estate, situated in East Norfolk about two miles from Ryburgh Station, on the Norwich and Wells branch of the Great Eastern Railway, and about five miles from the town of Fakenham, is owned and occupied by B. Le Neve Foster, Esq., J.P., whose name has recently appeared before the Chrysanthemum-loving world as a successful exhibitor of cut flowers. Like many other estates in Norfolk, Sennowe is splendidly wooded, and contains some fine Oaks, Elms, and other trees. The woods alone occupy an area of about 360 acres.

One of the most prominent features of the place is a carriage drive one and a quarter mile in length. This drive is formed of red gravel obtained in the neighbourhood, and is bordered on each side by a belt of lawn 10 or 12 feet wide, at the back of which are four magnificent rows of splendidly furnished specimens of the Norway Spruce, interspersed here and there with *Cupressus Lawsoniana*, *C. macrocarpa*, *Cedrus Deodara* and *C. atlantica*, *Picea insignis*, *P. Nordmanniana*, and *P. pinsapo*. The average height of these trees is about 30 feet, and they are

by the considerable portion thereof still hanging in the late house. At right angles to these houses, and in front of them, is an excellent span-roof Peach house 50 feet long by 16 wide, from which 1000 to 1200 Peaches are obtained in the season. It is in this house that Mr. Gilbert flowers his Japanese Chrysanthemums, the incurved varieties occupying the vineries.

A large conservatory adjoins the mansion. The roof of this is covered with *Tacsonia Van Volxemi* producing an abundance of richly coloured flowers. A very fine collection of Tuberous Begonias have been grown and flowered in this house. Two grand specimens of *Dracæna australis* are also noticeable, and during the summer these are used with good effect outside, as may be seen by the engraving (fig. 67). Gloxinias are well grown, and a collection of these occupy nearly the whole space in the conservatory in early summer prior to the Begonias coming into flower.

The lawns and pleasure grounds are limited in area, but as they open on to a finely timbered park of fifty-two acres this is not noticeable. Mr. Foster appears to take a just pride in his estate, and in seeing

FIG. 67.—A VIEW IN SENNOWE GARDENS, NORFOLK.

uniform in shape and size. I am told by the proprietor that this drive was formed and planted thirty to thirty-five years ago by the late Mr. W. Barron of Elvaston. The majority of the trees were large specimens when planted, and were brought by road a distance of fifteen miles on Mr. Barron's machines from the Earl of Leicester's estates at Holkam.

The mansion is a somewhat low-built, square, old-fashioned structure, covering a considerable area. The courtyard and stables are extensive and good, the latter having been recently re-modelled inside and fitted with all modern appliances by the present proprietor.

The kitchen gardens are about two acres in extent, forming a square surrounded on three sides by high brick walls and on the fourth by the gardener's cottage and a range of glass houses with potting sheds and offices at the back. This range of lean-to houses comprises two vineries and a large structure devoted to Melon culture in the summer and as a forcing house in the winter. In this house now are some well-grown Poinsettias developing fine bracts. There is also a fine batch of Callas now throwing up spathes freely, plants which were planted out during the summer and lifted in September. Some *Coelogync cristata* in large pans, well grown and promising to flower abundantly, were also noticeable.

Some excellent fruit has been grown in the vineries as is evidenced

that it shall not suffer in his hands, and in this he is ably supported by his skilled gardener, Mr. Gilbert.—W. K. WOODCOCK.

PEAR CULTURE IN SMALL GARDENS IN TOWNS.

BIRMINGHAM has a well-earned reputation for having plenty of factory and other chimneys, and is celebrated amongst other things for smoke, and suburban gardens have not the advantages of pure air and plenty of sunshine which non-manufacturing towns possess. Difficulties, however, can be overcome when a cultivator goes heartily to work and makes a study of the first principles in gardening. At the Birmingham Chrysanthemum Show prizes were offered for two dishes of Pears grown within two and a half miles of the Birmingham Post Office, and Mr. F. Mole, who resides at Edgbaston, within the area, and whose doings as a fruit cultivator I have on previous occasions referred to, won the first prize with very fine Doyenné du Comice and Pitmaston Duchesse d'Angoulême Pears grown against a wall in his garden. Since then he has distributed amongst his friends some specimens of the varieties he has fruited this year, and I had the good fortune to be a recipient of some fine well coloured samples of Doyenné du Comice,

Durondeau, Marie Louise, and Beurré Diel, the latter being especially fine and Al in texture and flavour. In a letter accompanying the fruits Mr. Mole wrote, "The season has been apparently so unfavourable that I did not anticipate the pleasure of sending any of my Pears to my friends, but to my agreeable surprise, they are, I think, almost as good in flavour and texture as I have ever had them. It is one of those peculiarities difficult to understand. Perhaps cultivation has had a little to do with it, but that I will not take too much credit for. Doyenné du Comice, as usual, heads the list, then Marie Louise comes next. Beurré Diel is very sugary, but as is its nature, lacks the exquisite texture of the preceding varieties. It is, however, a Pear to be recommended, as it produces a much better return than any other variety I grow. Durondeau would have been better with a better season, but still it is a handsome Pear, and worth growing."

Mr. Mole's success year after year is to a very great extent due to culture, and growing sorts that will do in town gardens with proper cultivation. Judicious pruning, always at the right time, thinning of the spurs, and even blossom buds, and giving plenty of room to the shoots, is a part of his system of cultivation. Copious waterings in dry weather, repeated syringings, and thinning to secure a moderate even crop of fine fruit rather than a large crop of small fruit, are also practised.

In a conversation recently with Mr. Parker of Impney, and he knows how to produce fine Pears, I found that he also was a firm believer in very liberal applications of water to the roots of trees against walls at all times when they need it, and I think we may certainly say that in dry summers and autumns, and at the blossoming time, water should not be spared.—W. D.

DARWIN TULIPS FOR BEDDING.

FROM the *Journal of Horticulture* of November 24th, we conclude there exists some misunderstanding as to the value and the most recommendable use of our Darwin Tulips. "D., Deal," says they find no favour in his eyes, as they scoff at all florists' rules (page 454).

From this judgment it only results that the said horticulturist does not like the Darwin Tulips as breeders. Indeed, it seems they do not answer exactly to the English florists' rules as regards late breeder Tulips. This, however, is not our fault at all. We have never offered them as perfect English breeder Tulips, but we have always recommended them for their exceedingly good qualities as late bedding Tulips. Notwithstanding this statement, the Darwin varieties have been described in some English horticultural periodicals as breeders. In the *Journal of Horticulture* of June 7th, 1888, we read, "Messrs. E. H. Krelage & Son, Haarlem, send us a collection of breeder Tulips, which they intend offering for sale next autumn without waiting until they have rectified. The flowers are large, of good form, and most varied in colours, purple, mauve, crimson, rose, and vermilion shades being very abundant, and a number could be selected that, judged by a florist's standard, would be considered most promising when broken." This note regards the same Tulips which are now offered and sent out as "Darwin" varieties. So it seems that, even amongst English horticulturists, the opinions on the florist's standard of breeder Tulips are not always the same.

This is, however, not the question now. We only wish to state that the Darwin Tulips should be considered and judged as bedding Tulips, and we are sure that everyone who has once seen them in their full glory in the second part of May will agree with the praises they secured from all visitors to our nurseries.

Recommending these Tulips in particular ourselves cannot be our task nor our intention; but we think your readers, and "D., Deal," in the first rank, will agree with us when we endeavour to remove misunderstandings like the above.—E. H. KRELAGE & SON.

[We perfectly remember that some of the flowers sent to us were clean and well formed, but the majority can only be regarded as decorative varieties, and this is all that Messrs. Krelage & Son claim for them. For this claim they have justification.]

HORTICULTURE IN COLORADO.

YOUR reports of the horticultural shows in England are very interesting to Colorado readers. Perhaps an account of the Exhibition of the Colorado State Bureau of Horticulture, held this autumn, may be equally interesting to English readers.

So recently as 1863 Colorado, then a frontier and very sparsely populated region, did not possess a single mile of railroad, and in that year William Lee, an Englishman from near Croydon in Surrey, carted the first fruit trees (Apples) from Iowa City, Iowa, over 700 miles across the plains, and planted them a few miles west of Denver. To-day Colorado has 5060 miles of railroad, 30,000 acres planted with fruit, and the Exhibition recently held in Denver could be duplicated in the United States, and certainly (according to my experience of many fruit exhibits in my native country) not in the United Kingdom for variety, size, colour, and flavour of fruits grown in the open air.

Several hundred exhibitors sent in about 2000 plates of fruit, and the result was a surprise even to Denver people, who had not realised the rapid development of horticulture in Colorado within the past few years. As a matter of fact, since I came here from Lancashire in 1883 the orchards of Colorado have more than trebled in area. For instance, last spring 1600 acres were planted with fruit trees near the town of Grand Junction alone in not less than 40 acre tracts. A New York capitalist

planted 80 acres of Pears near Grand Junction, mostly Bartlett's, in 1891, and there are two 80-acre Peach orchards. One prominent feature of fruit growing in Colorado as against fruit growing in England is that here the man who plants the orchard owns the land, and is not a mere tenant. As a consequence he buys only the best varieties of fruit trees, and as he gets his land at from £3 up to £30 per acre, according to location, every year's growth of his trees rapidly enhances the value of his property, and having no rent to pay he is soon able to make a very comfortable living from his crops. Another thing, too, fruit trees bear earlier and heavier, and the fruit commands a better price than in any other district I have seen or read about. At the Denver Show over a dozen counties were represented, but those which took the lead are the newer counties of Mesa, Delta, and Montrose, on the western or Pacific slope of the Rocky Mountains, where climatic conditions are especially favourable to the successful culture of a wide range of fruits.

The following partial list will give an idea of the fruits exhibited. Apples.—Gravenstein, Northern Spy, Golden Russet, Summer Pearmain, Domino, Milam, Fulton, Duchess of Oldenburg, Tetoffski, Sops of Wine, Autumn Strawberry, Jersey Sweet, Smith's Cider, Winesap, Stark, Ben Davis, Maiden's Blush, Fall Wine, Willow Twig, Rambo, Rall's Jennette, Lawyer, Bailey's Sweet, Tallman Sweet, Jonathan, White Winter Pearmain, Whitney No. 20, McMahon's White, Yellow Transparent, Waggoner, Wealthy, Hyslop, Martha, Henderson's Sweet, Tulpehocken, Transcendent, Wolf River, Isham Sweet, Walbridge, Rhode Island Greening, Roxbury Russet, Missouri Pippin, Fameuse and Celestia. There were many Apples over a pound weight each and 15 inches in circumference. Pears.—Bartlett, Flemish Beauty, Duchesse d'Angoulême, Early Margaret, Clapp's Favourite, Tyson, Sheldon, Seckel, Howell, Louise Bonne of Jersey, Vicar of Winkfield, Beurré d'Anjou, Beurré Easter, and Winter Nelis. The Pears were very fine in flavour and quite equal to California Pears for large size. Plums.—Lombard, Bradshaw, Yellow Egg, Pond's Seedling, Victoria, all the Gages, five varieties of Japanese Plums, the German Prune, the French Prune, the Fallemburg Prune, Tragedy, and Robe de Sargeant. Some varieties are very prolific, and branches were exhibited with the fruit simply clustered on them for several feet. A number of native varieties of considerable value, which improve much with cultivation, were also exhibited. Grapes.—Black Hamburg, Tokay, Goethe, Zinfandel, Muscat of Alexandria, Sweetwater, Seedless Sultan, Muscatella, the Mission Grape (from the old missions in Southern California), and the Cornichon, a large blue oval Grape from France. All these varieties are grown in the open air, with very slight protection in the winter. Many bunches weighed 3 lbs. and upwards each. There were also exhibited over forty varieties of American Grapes, hardier in character. Peaches.—Over twenty varieties were exhibited, which are grown to perfection without any protection in the above-mentioned three counties. The names of the varieties having originated in the Peach-growing districts of America are therefore not likely to be well known in England. The Peach season lasts from the middle of July until the middle of October. Apricots.—Over a dozen varieties, besides the Russian, are successfully grown, of which fine samples were exhibited. Nectarines.—Three varieties were exhibited—viz., New White, Hardwick, and Stanwick.

In less than five years fruit will be shipped from the counties of Mesa, Delta, and Montrose by the train load, as it now is from California.

The Colorado State Bureau of Horticulture has had a number of specimens of Colorado fruit reproduced in wax, exact counterparts as to size, shape, and colour, for exhibition at the World's Fair in Chicago next year. The work was done by a local expert. I saw the original fruits and the wax copies, and know them to be correct, but feel convinced the wax models will be regarded as gross exaggerations by many of the visitors to Chicago. The Colorado State Bureau is also having 100 varieties of Strawberries grown in pots specially for exhibition, when fruiting, at the World's Fair. These attempts are all very well, but it is necessary to visit such a show as has just closed in Denver, or to visit the orchards and vineyards themselves, to fully realise the high character of the fruit which can be and is actually raised here. The supply has already decreased the imports from California and other States, but has not reached the local demand, for the mining towns consume large quantities of fresh fruit, and canning factories will be established the moment there is a prospect of surplus fruit, which, however, does not seem likely for a few years to come.

Should this letter be read by any energetic young man without incumbance, experienced in gardening, who is ambitious to make more headway for himself than there seems to be before him where he is, he would do well to write to Dr. Alexander Shaw, Secretary of the State Bureau of Horticulture, Denver, for a copy of volume vi. of the Annual Reports of the Bureau, which contains much practical, reliable, and official information as to horticulture in Colorado. Good land suitable for fruit growing can be got at reasonable prices in different districts.

In consequence of my previous letters in your paper, several young Englishmen have personally come to me for advice as to the best locality in Colorado for going into fruit raising, and that advice always is to visit each district, consult practical fruit growers in each district, work at least one season for a fruit grower before purchasing land, and then use their own best judgment. I am not directly or indirectly interested in any district, and cannot undertake responsibility in such a matter, but I am firmly convinced that there are many young men in England of the right sort as to character, training, and financial means who could do better for themselves in Colorado than at home, as considerable numbers of English emigrants have done. Success, however, depends mainly on the emigrant himself.—THOMAS TONGE.

DATES OF THE N.C.S. EXHIBITIONS.

I AM pleased to learn that the dates of the Exhibitions for 1893 are now settled. There are to be four meetings, the first commencing on October 11th for early blooms. The principal Show is fixed to open on November 7th, a later one on December 6th. The date of the September Show is not yet announced. They are three-days Shows. Provincial societies might well follow the example of the National in early announcement of the Shows, but they will not perhaps do so in their duration.—E. MOLYNEUX.

EDINBURGH CHRYSANTHEMUM SHOW.

IT is reported that 26,000 persons visited this Exhibition, and that over £850 were taken at the turnstiles, a considerable increase over last year's receipts. This fact affords ample evidence that the Chrysanthemum is increasing in popularity in the north.

THE KENT COUNTY CHRYSANTHEMUM SOCIETY.

WE are informed that the next Exhibition of this Society will be held on November 1st, 1893. The Shows, which are held at Blackheath, are always looked forward to as amongst the earliest near London, and are invariably good. Mr. H. J. Jones, Ryecroft Nursery, Lewisham, is the Honorary Secretary.

WELL-GROWN SPECIMEN PLANTS.

WILL you kindly insert in your next issue what I think will be of interest to your numerous readers, and especially to Chrysanthemum growers? The following varieties of Chrysanthemums I have seen to-day, December 5th, grown by Mr. Friend, gardener to the Hon. P. C. Glyn, Rook's Nest, Oxted:—Specimen plants of Peter the Great, Madame C. Audiguier, La Nympe, and Maiden's Blush. They were all grown in 10-inch pots, trained out, and measure 5½ feet in diameter. Several of the plants have over 300 blossoms.—H. E. COPPIN.

CERTIFICATED CHRYSANTHEMUMS.

A MEETING of the Floral Committee of the National Chrysanthemum Society was held at the Royal Aquarium on Wednesday, December 7th. A few novelties were staged, and but only one first-class certificate was awarded. This was to Mr. R. Owen, Maidenhead, for Japanese Anemone Enterprise, a creamy yellow centre with pinkish lilac florets. Mr. Owen also sent a white incurved Japanese, which was commended. C. B. Withnall, a promising incurved shown by Mr. Owen, the Committee wished to see again. Messrs. Pitcher & Manda, Hextable, sent, among others, a pretty incurved Japanese named Mrs. Lay, which the Committee wished to see again. Messrs. H. Cannell & Sons, Swanley, sent Mdlle. Marie Recourva, a large, loose, white Japanese, and the Committee wished to see this again.

RUGBY CHRYSANTHEMUM SOCIETY AND THE GARDENERS' ORPHAN FUND.

MAY I be allowed a small space in your paper to sincerely thank all exhibitors and others who so generously contributed flowers, fruit, plants, and vegetables to the stall held in aid of the above Fund at the Society's late exhibition, and to state that the proceeds accruing therefrom amounted to £9 2s. 6d.? A cheque for this sum has been forwarded to the Treasurer of the Fund.—WILLIAM BRYANT, *Secretary*.

[We should be pleased to find space for many announcements of this nature. The orphans, if they knew of such kind acts, would clap their hands with glee.]

W. W. COLES.

I HAVE had several plants of Chrysanthemum W. W. Coles which produced blooms of two colours, specimens enclosed. I presume the red one No. 1 is the true colour, although in every case the yellow blooms appeared first. I should like to know if this variety is subject to sporting in this way, and if the sport is worth trying to "fix." The plants were all struck in March last, and the crown buds taken towards the end of August.—J. H. W.

[The chestnut coloured bloom is correct and good, the yellowish one very far from being in a condition for its merits to be estimated. There can be no harm in establishing the sport if this can be done, though the variations may be the consequence of early buds. Perhaps some of our readers will be able to say whether or not W. W. Coles is subject to sporting with them.]

NATIONAL CHRYSANTHEMUM SOCIETY.

OUR Secretary's smart reply to my remarks in the last issue of the *Journal of Horticulture* (page 480) is, I am afraid, owing to my lack of definition, somewhat wide of the mark. They were in each case, I believe, directed at the Floral Committee, which, with one exception, is entirely recruited from London or its neighbourhood, and not at the "General;" but even in this case, with the honourable exception brought forward by Mr. Dean, I fail to find the name of one grower from the provinces on the list.

If this be owing to the apathy of the provincial societies, and not to

metropolitan exclusiveness, it is time they were stirred up to act in the matter. We have in Liverpool, Birmingham, and most of our important centres men who both know the Chrysanthemum and can grow it in such form as not to fear competition in any field, and no society can be called truly "National" which does not include a fair percentage of such men, both in its rank and file and also in its executive.

Mr. Dean ignores the latter part of my letter, but I hope the subject will not be allowed to drop until an improvement has been made, being persuaded that the matter is of vital importance to the Society. Of course I am aware that it is easier to grumble than to suggest practical means of escaping our difficulties, but free ventilation will keep the matter to the front and encourage all well wishers to the N.C.S. to be on the alert so that no really good chance of obtaining a better place of meeting may be missed.—CHAS. E. PEARSON.

THE CERTIFICATES OF THE NATIONAL CHRYSANTHEMUM SOCIETY.

I HAVE looked in vain for a satisfactory reply to Mr. Godfrey's complaint which lately appeared in your columns, and consider some further explanation or action is due from the Committee of this Society. Mr. Godfrey appears to have brought a definite charge against one of its members in a letter that was placed in the hands of the officials. If this charge can be denied it certainly ought to be, and so far there does not appear to have been any explicit denial. Such measures as were proposed to Mr. Godfrey may not be unknown in country villages, but in a large body which aims at being national and taking the foremost position in everything connected with the culture of the Chrysanthemum one naturally expects to find the executive composed entirely of gentlemen who are above all such practices, and are able to sink personal matters entirely out of sight when acting in a national capacity. If this cannot be accomplished the Society will certainly lose favour with its country friends.—W. H. DIVERS, *Ketton Hall Gardens, Stamford*.

NEW CHRYSANTHEMUMS.

FOR several years I have carefully made notes of any new or rare varieties that have come under my notice for the benefit of readers of the *Journal of Horticulture*, and from the numerous letters received I am led to believe that my selection has proved of service to many. More varieties than ever have appeared this season, and the lengthy lists in catalogues are almost bewildering to those who have not the opportunity of having seen the flowers. Exhibitors know well the advantage of being in possession of the new varieties as soon as they are obtainable, as improvements in any section always score a point or two more than inferior sorts. Even to those who do not make exhibiting a feature the introduction of a new variety is of interest. My notes here may not always agree with the description in catalogues. I base my opinion on the flowers as seen.

INCURVED VARIETIES.—These have received but few additions; these seem to come so sparingly that any really meritorious kind is sure of a welcome. Last year we had a number of French-raised seedlings, some of which were sufficiently meritorious as to find a prominent place in this season's exhibitions, notably Madame Darier. Of this I formed a high estimate last year, and it has fully come up to expectations. More than once it has been adjudged the highest honours as the premier bloom in the show, which says a good deal for its quality, as it belongs to the medium sized rather than to the huge flowered sorts. Well developed blooms possess the three points most essential in an incurved bloom—depth, solidity and smoothness of floret. For that reason Madame Darier will long find a place in the lists of exhibition varieties.

M. R. *Bahuant*.—This has been shown very often, sometimes in good condition, but never in the highest order of merit. The florets are too broad to admit of their forming a really neat and shapely bloom. Its depth and solidity are not in proportion to its breadth. The backward season has been favourable to this variety, which is naturally early in opening its blooms; hence its appearance so often in the stands. I have been told more than once that I am "down" on this incurved, but it does not come up to my ideal of an incurved bloom such as Lord Alcester or any of the "Queen" family, from which is supposed to be a seedling.

Madame Pierre Louis *Blancard*.—I would caution exhibitors to be careful in staging this variety in company with Princess of Wales late in the season. Badly coloured blooms of the latter are much like this newer variety, and if placed before judges who are not conversant with the form of this French variety, might deem it necessary to disqualify, although they would be wrong. It is not wise to run such a risk, and I mention this to avoid an error of that description. Properly coloured blooms of both sorts are distinct, but it is not always that all varieties can be so presented.

Mrs. Robinson *King*.—I fear we have no variety to equal this. It has, however, not been seen in such good order generally as one might have expected, but that is accounted for by the fact of it not being a good "Queen" year; moreover, as this variety was so hard propagated last spring to meet the large demand, I did not expect to see it take such a high position as it will do in the future.

Robert *Petfield*.—Perhaps this is the best of the new varieties in this section. It is a full solid flower, the petals especially firm, and slightly pointed at the tips. The colour is lilac with faint purple stripes. A promising sort, undoubtedly, as a middle row bloom. I do not know its origin, but it is being sent out by Mr. R. Owen.

Lucy *Kendall*.—This is another of Mr. Owen's introductions, and belongs to the Princess of Wales family, I should say possibly a sport from Violet Tomlin, which it much favours in appearance, the ground

colour being similar with a bronze suffusion. The blooms I saw were very compact.

Baron Hirsch.—Said to be a seedling from Lord Wolseley or Baron Beust; it favours both in some respects. It has some of the colour of the former with the floret of the latter, which is slightly pointed and rather erect. It should make a huge bloom, but whether the depth will be proportionate with its width is a matter to be determined later when it gets into various cultivators' hands. The colour is best described as bronze with a golden suffusion; the inside of the florets is crimson chestnut, but of course that should not be visible.

Mrs. Adolphus Jacobs.—A bronze coloured sport from the Japanese Madame Bacco. The florets are gold tipped when unfolding; this gradually passes away by development of the flower. The parent of this has been remarkably well shown this season, and now that large numbers are required in the leading classes this addition should prove useful, as it is the exact counterpart of its parent in everything but colour.

Mrs. Mitchell.—This is a sport from Empress Eugénie, and what is at once remarkable about the new comer is its immunity from damp. The parent is a notoriously bad "damper," but its progeny shows none of that. As a proof of this I have at the present time a plant growing at the foot of a south wall, where it has stood all the summer. It is now in bloom, and without any protection from wet it exhibits no sign of damp whatever, neither has it under glass. In growth it is the exact counterpart of its parent, and the only difference I see in the blooms is that Mrs. Mitchell has broader florets; the blooms also are deeper in "build." The colour, when the blooms first open, is buff faintly striped with purple; but when fully developed it is a deep warm shade of golden amber, the outer or lower florets flushed with rose. It was raised in New Zealand, and sent over to me to grow last year. It has already received four first-class certificates in England, including that of the N.C.S. As a middle or front row bloom it will prove most valuable on account of its distinct colour.

Richard Parker I have seen but once this season during a lengthy tour among the best shows, and that was at Norwich. It is said to be a sport from Miss M. A. Haggas and deeper in colour, which it is when in perfect condition; but cultivators must be sure that blooms possess the extra shade of colour requisite over that of its parent to make it distinct before staging, or adjudicators not knowing the difference may condemn it as a duplicate of Miss Haggas.

May Tomlin.—As generally seen, I regard this as a pale-coloured Violet Tomlin, and I fear not distinct enough to be classed as distinct from that variety.

Miss Bella Wilson, as I saw it, is too upright in the florets to incurve well, and without perfect incurving can hardly come up to exhibition form.—E. MOLYNEUX.

(To be continued.)

EUONYMUS EUROPÆUS.

I WAS very pleased to read Mr. Dunkin's note in your last issue (page 484) referring to the above beautiful British berry-bearing shrub. The past season seems to have been a most favourable one to this as to many other berry-bearing trees. Many of the Briars, particularly *Rosa canina*, have been very good indeed, and the same applies to *Pyrus torminalis*, commonly known as the Wild Service Tree. *Bryonia dioica* has been particularly attractive this season, and many others have helped to make the hedgerows and woods extremely delightful.

But the Spindle Tree mentioned at the head of this note has been so beautiful in this neighbourhood (Cirencester) that I have been tempted to plant a goodly number of them in the shrubberies. I fear, however, that our soil is too rich for them, for I observe that they bear their fruit in the greatest profusion where they are growing on poor stony soil such as is generally found on the sides of the roads on these Cotswold hills.

The autumn foliage has also been particularly beautiful around here during the past season. The common Maple, *Acer campestre*, has been very attractive, showing to the greatest advantage where it happened to be growing near a copper-coloured Beach. The Oaks and Elms have also been delightful; in fact, the valley (called the Golden Valley) which runs through a portion of the estate from whence I write to Gloucester has been a sight worth a journey from London to see. The woods are situated on the south side of this valley, and from the opposite side, which is on a level with the woods, a magnificent view can be obtained. So good is this view that hundreds of people avail themselves of it during the autumn of each year. The woods comprise trees of almost every kind of useful timber, such as the Oak, Ash, Beech, Sycamore, Maple, Larch, Spruce, and Pines, which give relief to the mass of light colour.—T. A.

A TOUR ON THE SOUTH COAST.

LANCING MANOR.

THE busiest time of the year over I decided to accept a long-standing invitation to spend a day or two on the south coast. On arriving at Lancing Station, my destination, I was met by Mr. Jones, gardener at Lancing Manor, the charming residence of J. M. Carr-Lloyd, Esq., and which is situated about two miles from the station and three from Shoreham. This gentleman is a large landowner, and his estate includes numerous market gardens. By the innumerable glass houses one sees in

all directions, the south coast must be the paradise of market growers. The glass houses at Lancing Manor were first inspected. These are not large, but are remarkable for the clean and healthy condition of the occupants. The first entered contained what is seldom seen—a number of perfectly clean Gardenias. Not a bit of mealy bug, scale, or fly were noticeable, and the plants were covered with blooms and buds in all stages of development. The Gardenias are very firmly potted in peat and sand, and grown close to the glass without any shade, and the short-jointed sturdy growth is a proof that this treatment suits them admirably. The next house is a small stove filled with a varied collection, Ferns chiefly, different species of *Adiantums* predominating. To show how well and quickly they are grown, Mr. Jones informed me that several specimens now 6 and 7 feet through were only in 4-inch pots two years ago. The soil he uses for all his Maidenhairs is simply loam and leaf mould without any other ingredient whatever.

The vineries when Mr. Jones took charge of the garden were in a very unsatisfactory condition, so bad that he obtained permission to replant them. They are now filled with very healthy short-jointed canes, and will doubtless soon give a good account of themselves. A splendid batch of *Souvenir de la Malmaison* Carnations next attracted my attention, plants in large and small pots all looking equally well. The conservatory is attached to the mansion, and contained the usual autumnal occupants, such as Begonias, Fuchsias, Pelargoniums in variety, and some very strong and floriferous Madame Desgranges and G. Wermig Chrysanthemums. Very pretty baskets of different varieties of Ivy-leaved Pelargoniums suspended from the roof greatly added to the attractions. The flower garden at the time of my visit was a little past its best, but was still very gay.

Standard Fig trees are a great feature of this place, and I was informed seldom fail to bear good crops. Many of the trees here and in the locality measure 20 to 30 feet through. The chief varieties grown are Brown Turkey and a variety they call "Madagascar." No pruning and training are attempted, and the trees simply run wild. In the kitchen garden every nook and corner are filled to overflowing with the usual vegetation necessary to a large establishment.

GORING HALL.

After leaving Lancing Manor I proceeded to Goring Hall, the country seat of W. Lyon, Esq., and finding Mr. Greenyer, the gardener, at home, he very kindly conducted me round this beautiful place. Some large Yew hedges, clipped in the old-fashioned style and partly surrounding a tastefully arranged flower garden, are great features here. Some very artistically arranged carpet beds at once attracted my attention. These when really well done certainly surpass, during the autumn, the ordinary flowering plant arrangements. *Koenigia maritima variegata*, as used in the carpet bedding here, struck me as being particularly effective.

I was next conducted to the vineries, three in number, and such a show of Grapes as is rarely seen in a gentleman's garden met my view. This was a real market grower's crop, and most gardeners would consider the Vines considerably over-cropped. Mr. Greenyer, however, assured me that these Vines had carried about the same weight of fruit for years. A good sewage tank is Mr. Greenyer's invigorator, not only for his Grapes, but Peaches, &c., very fine Beurré Superfin and other good varieties of Pears plainly showing the rich manurial properties of the sewage. The occupants of the kitchen garden come in for a share of this fertilising water. One application shows to an inch where it has been applied. A very pleasant evening spent with Mr. Greenyer will not soon be forgotten.

"VILLAGES OF GLASS."

Any garden tour on the south coast would be incomplete without a visit to one or more of the innumerable market garden establishments. The "village of glass" I selected to visit is owned by Mr. Nash. It is situated a short distance from Lancing station, and not far from the coast. Mr. Nash was not at home, but his manager, Mr. Neigh, kindly showed me through the principal houses. These comprise vineries, Peach houses, Tomato, Strawberry, and Mushroom houses. They are not all the same size, but average 160 feet in length by 22 feet in width. The vineries were entered first, and oh! what a sight. If I remember rightly, Mr. Neigh expected to cut over 3000 lbs. of Grapes from each house. The varieties chiefly grown are Black Hamburgh, Alicante, Gros Maroc, and Gros Colman. No expensive borders are prepared, but the Vines are simply planted in the ordinary soil, a heavy clayey loam. Frequent applications of manure, applied as surface dressings, and plenty of water and air are the elements of success.

We next enter a very large and lofty Peach house. Here, again, is a system of cultivation pursued not often seen in a gentleman's garden. Enormous growths are trained in, which most people would think impossible to mature, but which Mr. Neigh assured me in their light houses, ripen sufficiently to bring to perfection large crops of very fine Peaches. Mr. Neigh said fruits weighing over 16 ozs. had been gathered. I noticed the soil was very hard and dry. Tomatoes are nearly over, but sufficient remain to show what a splendid crop had been secured. The Old Red, crossed and intercrossed with other varieties, is the variety chiefly grown.

Another market garden also near Lancing I next visited. This is tenanted by Mr. Russell, who, in addition to what he produces under glass, grows hardy fruit and vegetables in quantity for the Worthing and Brighton markets. Mr. Russell's vineries contain similar crops to Mr. Nash's—all very heavy bunches of Grapes of superb quality. Several houses were being prepared for the reception of 3000 Callas.

The practice followed in cultivating these is very simple. The plants are put out in a batch as thickly as possible, not the orthodox 18 inches apart, watered once or twice, and then left to take their chance till lifting time. At the time of my visit they were splendid stuff, full of bloom and buds. Many other good things were to be seen, and I returned home satisfied that I had picked up many wrinkles.—G. T. D.

THE GARDENERS' ROYAL BENEVOLENT INSTITUTION AND YOUNG MEN.

"WELL-WISHER'S" letter on page 482 of the *Journal of Horticulture* is a laudable attempt to further promote the usefulness of this valuable Institution. In supporting the Institution gardeners in general are laying up for themselves (if ever needed) the means of support in their old age, and if never required so much the better for them. There will be the satisfaction that we, by our yearly contributions to the Institution, have been the means of helping to assist some of our brothers or their widows in distress in their old age. I know that there are gardeners who would gladly, if their means would allow them, support the Institution. On the other hand, there are doubtless many who never give the Institution more than a passing thought, except when a discussion or an appeal is issued in the gardening papers.

The idea to invite foremen and journeymen to join is excellent, and I hope if agreed upon that many will co-operate, and have votes in proportion to the amount of their annual subscription. Another plan I should like to mention which, if adopted, I think would be a benefit to the Institution. Head gardeners who desire to join and do not feel themselves able to contribute the guinea all at one time should, by a new rule, be permitted to tender their subscription in two half-yearly subscriptions of 10s. 6d., or four of 5s. 3d. quarterly, as it is not every gardener who can spare a guinea all at once. It is all very well for some people to say that a guinea is not much, but when this and other subscriptions are taken into consideration, to which head gardeners who desire to keep themselves informed of all that goes on in the gardening world contribute, I think we should stop and think before we speak too harshly of those who have not seen their way to join this Institution, but rather see if ways and means to make it more easy for them to do so cannot be devised. The Manchester Unity and Foresters, &c., adopt monthly and quarterly subscriptions with success, and the same means should be provided to make our Institution popular, then young gardeners might join more freely under a system of graduated subscriptions.—JOHN CHINNERY.

CYCLAMENS AND BOUVARDIAS.

[Abridged from a paper read at a meeting of the Devon and Exeter Gardeners' Association by Mr. JAMES PAYNE.]

DEALING first with the Cyclamen, the essayist said that it was one of the finest decorative plants for the greenhouse, the conservatory, or for house decoration, and on account of its free-flowering habit, its pretty foliage, and its gay flowers was particularly serviceable during the winter months. In growing it he counselled sowing fresh seed every year in the month of August. The seed should be sown in pans well drained and filled to within an inch of the top with finely sifted loam, leaf soil, and a little coarse silver sand, pressing the soil rather firmly in the pan. Before sowing the seed water the soil and let it settle for an hour. Place in a temperature of about 55° and put a little moss or a piece of slate over the pan to shade it and hasten the germination.

When the plants are large enough to handle prick them off into 4½-inch pots, six in a pot, in the same kind of soil and temperature. In the winter months the plants should only be "dewed" with a fine syringe morning and afternoon. Towards the end of December the seedlings should then be large enough to pot off singly; and when, in March, the sun gets stronger, they should be partially shaded else they are apt to droop. A check of this kind throws them a long way back. In June give the plants another and final shift into their flowering pots (4½-inch). Let the corm be a little above the soil, and mix a little well decayed cow manure and road scrapings with the compost. A little soot at the bottom deters the ingress of worms. In growing Cyclamens in frames they ought, by means of shingle or coal ashes, to be raised to near the glass to keep them stubby and strong. This is an important matter in growing them well.

The ideal house for growing the Cyclamen in is a span-roofed structure with the path in the centre. Care must be taken not to let the plants get a chill through a sudden frost coming on. Cyclamen can be grown on a second year, but unless it is well done it is better to start afresh every year. In picking the blooms they should be pulled right up, as, if the part of the stalk remaining rots down, it is apt, by contagion, to damage the incipient buds. Cyclamen come true from seed. If large flowers are wanted grow the giganteum varieties.

The same kind of soil and temperature that suits the Cyclamen will do for the Bouvardia. The latter is best propagated by cuttings in spring, although division of the root is practised by some gardeners. When the cuttings are taken off they ought to be plunged in a bottom heat of about 75°, and kept shaded until they strike. When growing their straggling points should be taken off. The plants should be flowered in 5½-inch pots, which are large enough for the first season. When in the frames they should be shaded, but when the warm weather sets in they should be stood right out in the open—in cocoa-nut fibre if possible, as that keeps an even temperature about the roots. Upon no account must they suffer then through want of water, and a little help in the way of liquid manure will not be lost upon them.

Early in September they ought to be taken into a cool house and brought on to the flowering state. In placing them out of doors in the summer they must not be exposed to a blazing sun, as that would scorch them. The north side of a wall is more favourable. Red spider is apt to affect them, but that can be got rid of by some of the insecticides sold by the seedsmen. Gardeners who have Cyclamen and Bouvardias to cut from need never be at a loss when asked to make up a spray for a lady to wear in her dress or in her hair, nor for a buttonhole bouquet for a gentleman. As decorative plants their value is still greater.

JAMESIA AMERICANA.

ALTHOUGH perfectly hardy out of doors, and amongst the earliest of the North American plants, *Jamesia americana* (fig. 68) is admirably adapted for forcing. It may be lifted and potted in the autumn much in the way recommended for Rhododendrons and similar plants, or kept in pots and transferred to the greenhouse early in January. It will

FIG. 68.—JAMESIA AMERICANA.

flower early in March, and extend over April, in mild seasons sooner. As it never fails to bloom, and seems quite indifferent to either wet or dry seasons, it is a valuable acquisition, and should be extensively grown.

The plant grows naturally of a rather straggling habit, but this may easily be remedied by pruning. The shoots are stout and woody, and are much-branched. The flowers are in large corymbose heads, and are borne laterally, also opposite, on every joint, and smaller than the lateral ones. They are pure white and slightly fragrant, lasting a considerable time in a cut state. The leaves are borne in opposite pairs on the young shoots, stalked, oval-shaped, and evenly and sharply serrated. They are of a fine light green colour, and covered with a fine silky down, which makes them quite silvery underneath. As it rarely if ever ripens seed in this country, the best way to increase it is from cuttings, which should be placed in cool frames in a shady position, and watered very sparingly until rooted.

As a low-growing shrub it is unequalled in early summer, its pure white flowers having a peculiar fascination where the run on white cut flowers is large at that season. Equally useful also as a tall shrub for the background, it is exceedingly floriferous in either position. The flowering season in the open air extends over May and June, and the flowers are produced in profusion.

A LUCKY SHOWMAN.

I HAVE read with much pleasure the note of Mr. Portsmouth on page 483 on Grape culture in the North of England, and can confirm every word he has said. His article is headed "A Lucky Showman,"

and so he was by exhibiting Grapes at South Shields on the 9th and 10th of November last, and getting the first prize, also winning the silver medal in recognition of superior cultural skill. But the exhibitor of these Grapes only entered his present situation about the 15th August, 1892. Mr. Portsmouth says he saw the Grapes about a fortnight before the late gardener (Mr. Shuttleworth) left his situation, and the Grapes then were nearly finished. A few days before the gardener left I saw them, and they were then I considered finished. A finer house of Grapes at that time I never saw. I may also mention that in 1891 Mr. Shuttleworth took nine first prizes and ten seconds at various leading shows in the neighbourhood for Grapes alone. It is clear the late gardener grew the Grapes for which the present one received the honours. I also notice the latter had the first prize for white Grapes at Gateshead on the 29th of November, cut out of the same house. As Mr. Portsmouth fairly says, "Let honour be given where honour is due."—FAIRPLAY.

[It is not easy to deal satisfactorily with such cases as this. The owner of the Grapes may have desired their exhibition. The judges were bound to give the awards to the best produce, by whomsoever staged, and if the schedule announced that their awards were "final," the Committee would be equally bound by their decision. Mr. Shuttleworth missed the prizes for the Grapes that he evidently did so much towards perfecting because he left his situation, and consequently could not show them. His successor may be equally capable, and may have grown Grapes elsewhere with which someone else might have won prizes. He appears to have been fortunate in following such a good Grape grower as he did, and it would be a graceful act, if practicable, to grant Mr. Shuttleworth a medal for his admitted cultural skill.]

VINE LEAVES AND LATERALS.

HOWEVER much "Warwick" may pretend to ignore the fact, he must know that his method of attack under a pseudonym is somewhat the reverse of courageous. Your correspondent evidently thinks he has a good opportunity of taking me at a disadvantage; I can, however, assure him that I provided for such a contingency. I therefore now take the course suggested in the editorial footnote (on page 488), with which I thoroughly agree. The Vine leaves I forwarded to 171, Fleet Street, were grown by Mr. J. Kitley, who, as many know well, rents the vineries here, the treatment of the Vines having been identical to that which I have long practised. They formed a splendid illustration of good culture ready to hand, and the specimens were sent with the full consent of the grower and knowledge of the Editor that full credit would be given in due time to the improver of the Vines for his excellent work. The public will probably have the penetration to notice how wonderfully interested "Warwick" must be in these now notorious Vines. I have considerable pleasure in being in accord with him on one point. Without doubt Mr. Ward grew good Grapes before he saw me, and I have no doubt will continue to do so as long as he attempts to grow them. If a few years in charge of the fine vineries at Longford is not calculated to make both a good Grape grower and a Grape enthusiast, I hardly know what is. Perhaps my critic will be so good as to inform me if he thinks the vineries at Warwick have always been a better school?—H. DUNKIN.

MIGNONETTE.

How beautiful and useful is this very popular and sweetly perfumed plant, yet it is seldom grown to perfection in private establishments. It is most useful when employed in a cut state, lasting a considerable time in water. When so employed the ends of the stalks should be cut off every morning, and the receptacle replenished with a fresh supply of water.

Having been very successful in the cultivation of Mignonette this season, I think, perhaps, a few words respecting my method of cultivation may be of interest to some readers. I think by far the best varieties to grow for autumn and winter use (and that is what I purpose more particularly to refer to at the present time) is Machet and Miles' Spiral, the latter being of much greater length in the flower spikes, but lacking in girth and colour. Machet has the brightest colour, and is of a more dense and sturdy habit. I think if confined to growing one variety only, I should certainly give preference to Machet.

Seeds of the above varieties may be sown about the middle of July, using the pots in which they are intended to flower. I think the plants succeed much better when so treated than when the seed is sown in smaller pots and potting-on is resorted to, as they are very impatient of root disturbance. Mignonette prefers a rich soil; two parts loam, one of dried cow manure, and a little lime rubbish will form an excellent compost for them. The pots should be clean and properly drained, this being very essential to the successful culture of Mignonette. The soil should also be made firm, but not rammed in in layers. The seeds ought then be sown evenly over the surface and covered with a little sifted soil similar to that before mentioned. Afterwards place in a cold frame on a bed of coal ashes, and water through a fine rose. The frame may be kept close till the seedlings appear, when plenty of air must be admitted, and the young plants thinned out to about five or six in an 8-inch pot. I make two thinnings, the first as soon as the plants appear, and the second when they are large enough to determine which are the best.

The first bloom which appears should be promptly removed and the shoots from the next break thinned out, leaving three or four on a

plant. Each shoot ought to be provided with a neat stake before it gets large enough to fall about. A little artificial manure should be applied after the racemes begin to show themselves, once or twice a week; liquid farmyard manure is also an excellent stimulant if judiciously applied, greatly assisting in the development and lengthening of the racemes. The plants should be placed in a light airy house for their winter quarters about the end of September, a house where Carnations are grown with a temperature of from 45° to 55° suiting them admirably. Where this treatment is properly carried out the result will be fine specimens in full bloom four or five months after sowing, and they will continue to flower several months. I have Miles' Spiral with racemes 13 inches in length, and Machet with some 9 inches in length.—G. PARRANT.

THE CULTIVATION OF THE FUCHSIA.

[Mr. W. P. ROBERTS, Ovenden Hall Gardens, read the following paper at a meeting of the Preston and Fulwood Horticultural Society.]

MR. ROBERTS said it was frequently remarked, and with some truth, that the Fuchsia was not grown so well and so extensively as it used to be, and that the wretched specimens seen at shows were mere shadows of what were grown at one time. Personally he could vouch that the Fuchsia was as high in his estimation now as it was when he first took up its culture twenty or more years ago. As a window plant it was a universal favourite with cottagers, and he expected it would find space in their windows and greenhouses when many of its contemporaries had passed out of cultivation and were forgotten. It was rather singular that the first Fuchsia introduced into this country was grown for a time in a cottage window. It was brought by a sailor from Chili in 1746, and was growing in the window of his mother's dwelling when it attracted the attention of Mr. Lee, nurseryman, of Hammersmith, amongst many others, who, after sundry offers, ultimately procured it for 80 guineas, on condition that he could return a plant or two after a stock had been secured. This plant was named *Fuchsia coccinea*. Some eighty years later hybrids were raised, and since then scores of varieties had been grown which were not now in cultivation; they have been superseded by better sorts.

All the sorts were beautiful, and many formed natural drooping pyramids, and two—Wave of Life and Sunray—had pleasing variegated leaves. The doubles had not such good habit as a rule as the singles, but with a little manipulating they could be trained to any form. He proceeded to the mode of propagation, and said that cuttings might be rooted at any time from January to September, but they rooted sooner and with greater certainty in the spring than during the autumn, providing there was accommodation in the way of a house or pit with a temperature of 60° to 70°. In the latter he had them ready for potting into 3-inch pots in ten days. The usual method of rooting them was to put several in small pots filled with sandy soil and a layer of sand on the surface, a portion of which trickled down and followed the cutting. The sand did not hold so much water between the particles as soil, consequently the cuttings were not so liable to decay. The pots were either plunged in bottom heat or covered with handlights according to accommodation. It was notorious that the Fuchsia would root in sand and water with the greatest freedom, scarcely a cutting missing. He filled a few garden saucers with sand and made it fairly sloppy with water. Then the cuttings were thrust in without the aid of the dibber. In the early months of the year the cuttings required no shade, neither would they flag if the sand were kept moist. In order to have cuttings ready in January it was necessary to start some plants in heat in December. He would follow the rooted cutting into its 3-inch pot, with its roots surrounded with sweet sandy loam, leaf mould, and a sixth of burnt earth, or a smaller portion of charcoal dust. For a few days the young plants should remain in the house they were rooted in, but as soon as they had good hold of the soil and were on the move a temperature of 55° to 60° would suit them better than 60° to 70° from then until they were in flower and their growth completed. The structure must not be an airy one. The plants must be kept constantly on the move by maintaining a moist growing atmosphere, produced by syringing and sprinkling the floor and other surfaces.

Probably the present day greenhouses, which were nearly all glass and very little wood, were not so suitable for the Fuchsia as those of less modern build. Many of those ancient structures, with their small squares of glass, sunk paths, and other internal structural arrangements, had naturally a moist genial atmosphere, which enabled our forefathers to grow plants with greater ease than we can, and this would in a measure account for any decline there may be in its culture. The best plants he ever grew were located in a deep-sunk brick pit, the bottom of which was always moist and cool. The plants in their early stage were on a temporary stage, and as they grew were lowered until they ultimately reached the floor. He was convinced that from the end of May the Fuchsia would do better out of doors, in a shady sheltered corner, plunged in some material to prevent the wind blowing it over, than it did in many houses.

To keep the plants steadily growing they must not be allowed to get the least root-bound, and though it was not safe to give dates as to when they should be potted, it might be fairly assumed that those rooted in January and potted into 3-inch pots would in March or April be ready for 5 or 6-inch pots. The next pot must be 3 inches larger, and the potting must take place ten or twelve weeks before the plants are wanted to flower. If they have been properly attended to they should by July be quite 3 feet in diameter and 6 inches more in height, bushy,

furnished with shoots overhanging the pots, and loaded with flowers. If larger and later flowering plants were aimed at they must be again moved into still larger pots. He rarely grew any of the plants in pots the second year, but made a practice of planting them in the open air in beds. They, however, did very well the second year in pots, and after the leaves were off they should be pruned and stored in any frost-proof structure that was not too dry.

In conclusion, he said the varieties of the Fuchsia were numerous. A few of those he had grown were Lord Falmouth, General Gordon, Gazette, Sir Colin Campbell, Lord Clyde, and Try Me O. The last named was once a great favourite with market growers. Diadem, Clio, Guiding Star, Mrs. Marshall, Marguerite, Rose of Castille, and an improved variety of it, were sorts which still found their way into the exhibition tent, and for general usefulness it was a question if they could be surpassed.

Mr. Payne said the best Fuchsias he had seen were raised in February. They were over 5 feet high, and were grown under a north wall and out of the sun. They had grown 5 feet in one season.

Mr. Roberts, in reply, said it was an easy matter to grow Fuchsias 5 feet high, and 2½ or 3 feet through in a season. His paper had been prepared mainly for amateurs, and he expected that they would have some questions to ask.

Mr. Ashworth said that as an amateur he was highly pleased with the paper. Among cottagers there was another name by which Fuchsia was known, and that was "dropper," and they did drop (laughter). He should be very glad if Mr. Roberts could tell him how to prevent the dropping. Of course, he did not want to be told to tie the flowers on (laughter), but how he could keep them on naturally. He had grown Fuchsias for sixteen years in a backyard in the heart of Preston.

Mr. Roberts said he had never known the flowers to drop in the country; he had not had experience of them in the town.

NATIONAL CHRYSANTHEMUM SOCIETY.

ANNUAL DINNER.

THE annual dinner of the National Chrysanthemum Society was held at Anderton's Hotel, Fleet Street, E.C., on Wednesday, November 30th. Sir Edwin Saunders, F.R.C.S., President of the Society, occupied the chair, and he was supported by a large company, comprising upwards of 120 gentlemen. Amongst others present were Sir John Llewelyn, Bart.; Sir Henry Doulton, W. Herbert Fowler, Esq. (Mayor of Taunton), A. J. Veitch, Esq., C. C. Paine, Esq., E. C. Jukes, Esq.; G. J. Ingram, Esq., J. W. Wilkinson, Esq., Dr. Walker, Messrs. C. H. Payne, R. Ballantine, J. R. Starling, H. Cannell, and numerous well-known Chrysanthemum growers. The arrangements were admirably conducted by Mr. R. Dean, the Secretary.

Sir Edwin Saunders, after the usual patriotic toasts, gave the toast of the evening, that of "The National Chrysanthemum Society." In doing so he said it would be needless to make a long speech, inasmuch as the majority of those present were members and well acquainted with the affairs of the Society; and those who were not members would doubtless be so shortly. He, they would be glad to hear, had enlisted two very distinguished persons in his friends, Sir John Llewelyn and Sir Henry Doulton. The former had come all the way from Wales on purpose to be present. Regarding the National Chrysanthemum Society, it had worked, he thought, a great revolution in the floricultural world, since it had developed from a local suburban society into one of national importance and magnitude. It had had an uninterrupted progress. The value of the Floral Committee meetings could not be over-estimated, and holding conferences, reading papers, and giving certificates fully accomplished the objects the Society had in view. The present high development of the Chrysanthemum could be attributed to the Society, for by the exchange of ideas, affording stimulus in offering prizes, and friendly rivalry, this state of things has come to pass. What would London be without its November displays at the Aquarium? He may safely say that the shows were of great importance from an educational point of view. One can hardly judge the effect they have upon mankind. To his mind they furnish as useful a purpose as the fine art exhibitions of the Royal Academy. (Hear, hear.) According to the latest accounts the Japanese, our most formidable rivals in Chrysanthemum growing, have never been able to produce such good results as are to be seen in this country. With regard to the numerical strength of the National Chrysanthemum Society, there were now 706 members on the books. Of these 637 were ordinary members and sixty Fellows of the Society. There were also twenty-six foreign members, including seven in America, seven in Belgium, six in France, one in Holland, one in India, two in Italy, one in New Zealand, and one in Tasmania. There were ninety-four affiliated societies, eighty-five of these being at home, and nine colonial. To return the compliment paid a short time back by Mr. J. Earland, of Wellington, New Zealand, to the National Chrysanthemum Society, the latter had made arrangements to send out twenty-four blooms, frozen in ice, to the Wellington Chrysanthemum Society.

C. C. Paine, Esq., then gave "The Vice-Presidents and Officers of the Society," coupling with this toast the names of Sir John Llewelyn, Bart., and Messrs. J. R. Starling and C. H. Payne. Mr. Paine said that although the Society had lost many Vice-Presidents, he was proud to say that they had gained an enthusiast in Sir John Llewelyn. Without the indefatigable officers the N.C.S. would never have come into such prominence. He should like to hear, however, that the Foreign Secretary (Mr. C. H. Payne) was in correspondence with Japan. They had members and affiliated societies in many parts of the globe, and if

there was a society in Japan he should be glad to hear of its being affiliated to the "National." As an old member of the original Stoke Newington Society, Mr. Paine referred to the development of the N.C.S. A list of prizewinners was published by the Stoke Newington Society, and he thought a similar method might with advantage be adopted by the "National." If published with the annual report and circulated among the members it would be appreciated by many. Regarding the work accomplished by the Society, he should like to see greater prominence given to the Chrysanthemum as a decorative plant. (Hear, hear). Dwarf, naturally grown, bushy plants suitable for conservatory decoration should be more generally seen at exhibitions. He would gladly offer a prize for such if the Committee could see their way to include it in the schedule.

Sir John Llewelyn, Bart., in responding, said he felt sure that the success of the Society was due to the assiduity and courtesy of the officers. He regarded the Chrysanthemum as one of the most important of flowers, for what would the floral chain be without it? The Chrysanthemum forms the best link in the floral chain, because it comes at a time of year when other flowers are past their beauty. There was one reform, however, that he should like to see accomplished, that was the name of "Chrysanthemum." He invited all interested in the matter to find out a better and shorter name, for after all "Chrysanthemum" merely meant "yellow flower," which did not do justice to the beautiful and varied colours now seen. It had struck him when visiting the Shows that the specimen plants covered with bloom were the most interesting and beautiful in the whole Exhibition. If possible, he thought it would be advisable for the Society to be in communication with the Chinese.

Mr. J. R. Starling briefly referred to the financial state of the Society, and remarked that once there was a reserve fund of £100, but now, he regretted to say, it was *non est*. He hoped it would be re-established as a nucleus for the Society to fall back upon; for although at present in a flourishing condition, they never knew when it might be needed.

Mr. C. H. Payne referred to the foreign work of the Society, and said that the eyes of the Continental growers were upon the N.C.S. A National Chrysanthemum Society had recently been started in Belgium, and there was also stated to be a similar organisation in America.

E. C. Jukes, Esq., proposed the "Affiliated and Kindred Societies," and said that the fact of having ninety-four affiliated societies was most gratifying, and sufficient to show the high appreciation in which the National Chrysanthemum Society was held throughout the kingdom. The country societies no doubt derive benefit through being affiliated with the N.C.S., but he did not disguise the fact that the advantages were mutual. Referring to the letter which appeared in the *Journal of Horticulture* (page 461) regarding the infusing of country blood into the Committee, all affiliated societies had a right to send a representative to every meeting, and it was entirely their own fault if they neglected to do so. He thought the remarks about a "London clique" were unjustifiable. He did not think it could truthfully be called a clique. (Hear, hear.) If it was possible to have country members on their Committees he for one would welcome their presence. But it was no use having country members on their various committees if they did not, or could not, attend the meetings. So far as his experience went every suggestion, no matter how unimportant or otherwise, made by country members received the fullest attention of the Committee, and he hoped that they would, whenever possible, attend the meetings. As he had said, they will be accorded a hearty welcome, and every suggestion they make fully considered.

Mr. R. Ballantine, Chairman of the Committee, proposed "The Health of the President," and in doing so paid a tribute to Sir Edwin Saunders and Lady Saunders. Responding, the President briefly thanked those present for the enthusiastic manner in which his health had been drunk, and said that he would endeavour to do his best towards the Society so long as he was able.

Mr. W. Herbert Fowler gave "The Royal Aquarium and Summer and Winter Garden Society," to which J. W. Wilkinson, Esq., responded.

The Chairman proposed "The Visitors," and in responding Sir Henry Doulton remarked that to him gardening appeared to be one of the purest and most pleasant pursuits imaginable. It was really wonderful to see the interest which poor people take in the culture of flowers, and many would trudge miles to see a display of Chrysanthemums.

Dr. Walker rendered "The General and Floral Committees," Messrs. A. J. Veitch and G. Gordon responding.

"The Horticultural Press" was proposed by Mr. G. J. Ingram, and responded to by Mr. B. Wynne.

The prizes, including the Society's challenge shield, cups, and medals, won during the season were distributed to the respective winners, and aided by a capital musical entertainment a most enjoyable evening was spent.

ECHEVERIA SECUNDA GLAUCA.

As an edging to all kinds of summer bedding this Echeveria is useful and effective, and for tracing designs on carpet and succulent beds it is indispensable. It is a pity that the plants are not sufficiently hardy to pass through our winters out of doors, as in most places it is difficult to find shelter for several thousand plants of this class. They can be wintered successfully in cold pits, but there is a danger of losing them wholesale from damp during long spells of severe frost, when they have to remain covered for a long time. We winter thousands of them in

an outhouse, from which frost is excluded, by placing them on slated shelves and stringing them in the same way as Onions are often t eated. We used to keep them in sandy soil, but found that was not at all necessary, as they were not so liable to damp and kept just as plump if merely placed close together on shelves. The principal disadvantage of keeping them in sheds is that in periods of mild weather they start growing, and from want of light and air the leaves are so thin and devoid of substance that when planted out in spring the plants suffer very much, many of them losing their leaves to the centre. This can be partially avoided by admitting abundance of air during mild weather and by giving them all the light possible.

In order to secure even-sized plants for tracing carpet beds seeds should be sown at once on fine sandy soil in well drained pots or seed pans, and the plants grown through the winter on a greenhouse shelf close to the glass. Abundance of new seed can now be secured from old plants that have been allowed to flower, and this will germinate much quicker than old. The seed pods should be dried and then rubbed through a hair sieve, but as the seed is so very fine no attempt should be made to clean it. It is best to give the soil a good watering before sowing, so as to avoid if possible having to water it after the seed is sown. The seed must be only very slightly covered with soil; indeed, it is not necessary to cover it at all, but a piece of glass should be placed over the pan so as to exclude air and thus preserve the surface soil of a uniform dampness. Place the pan in a shady place, either in a cold frame or greenhouse, and if the soil becomes dry before the seedlings are established it should be moistened by standing the pans in water deep enough for the latter to rise to within 1 inch of the surface of the soil. When the plants are large enough they will require pricking off first into 5-inch pots, and later on into shallow boxes, always using light sandy soil and providing plenty of drainage. If the seedlings are grown through the winter in a warm greenhouse and early in spring carefully hardened they will make useful plants for tracing designs or edgings in May.

The larva of the beetle *Otiorhynchus sulcatus* sometimes attacks this *Echeveria*. Last year we lost many hundreds of plants through its ravages alone. The female appears to deposit her eggs between the base of the plant and the roots, and as soon as they are hatched the larvæ commence eating their way through the centre of the stem until they reach the heart of the plant. Insecticides strong enough to destroy them cannot be used whilst the plants are growing, but much may be done when the latter are taken up by cutting away the affected stems and burning them. If possible, a few inches of the surface soil where badly affected plants have been growing should be taken away and burnt. A sharp look-out should be kept for the beetle in spring. It belongs to the great weevil family, and can be generally known by the head, which is produced in a rostrum. The abdomen is large and long in proportion to the thorax. In the present species the elytra is brownish black, irregularly splashed with greyish-yellow spots, and is about three-eighths of an inch long.—J. H. W.

FRUIT FORCING.

Peaches and Nectarines.—*Earliest Forced House.*—Although a moist genial condition of the atmosphere assists the buds in swelling, and their scales are more freely burst by the developing blossom when the trees are syringed, it must not be practised to the extent of keeping them constantly wet, for an excess of moisture has a weakening tendency. An occasional syringing is all that is necessary when the weather is moist, the border being properly moistened and the surface damped when it becomes dry. In bright weather the trees may be syringed in the morning and early in the afternoon, until the colour of the blossom can be discerned. Maintain a genial condition of the atmosphere by sprinkling available surfaces other than the trees in the morning and early afternoon. The atmosphere must not then be kept so close, as it is essential that the blossoms come on steadily, and have time to develop a strong flower, perfect in all its parts. If the blossom buds are too numerous rub off those on the under side or at the back of the trellis; a gloved hand drawn the contrary way of the growth will do this expeditiously. Allow a little ventilation constantly; commence to increase it at 50°, above which it should be correspondingly enlarged, but not permitting a decline below 50° in the daytime, sufficient artificial heat being employed to raise the temperature to 50° shortly after daybreak, and maintain it at that during the day. With sun heat an advance may be allowed to 65°, but only with free ventilation, and close for the day before the temperature has receded to 55°. Avoid a close moist atmosphere, also warm at night, a temperature of 40° to 45° being ample in cold weather and 50° when mild. Supply water to inside borders, so as to moisten the soil through to the drainage; but where the roof lights have been off until the trees were started the border will not need any until the fruit is set or later.

Second Early House.—This is usually started at the new year. If it contain Alexander and Early Louise Peaches, the fruit will ripen in May without need of hard forcing; if planted with Stirling Castle or Royal

George Peaches and Elruge Nectarine their fruit will not ripen before June. If the roof lights were removed when the growth was matured, they should now be replaced, and the pruning, cleansing of the house, dressing the trees, tying them to the trellis, and top-dressing the border effected. The borders will be moist enough, but a sprinkling of bone meal three parts and one part sulphate of potash being given, in mixture, at the rate of 4 ozs. per square yard, wash it in moderately. Inside borders under fixed roof must be made thoroughly moist, soaking again and again with water so as to moisten every particle of soil down to the drainage, and if the trees are weakly follow the watering with liquid manure. Protect the outside border with dry leaves and a little litter, a few inches thickness sufficing. Exclude frost, employing fire heat only to effect it, and ventilate fully at and above 50°, forcing not being commenced before the new year.

Succession House.—It is much the best plan to remove the roof lights and expose the trees to the elements for the winter. This is an excellent practice, for the coddling of Peach and Nectarine trees in a house kept above freezing point to insure safety for plants is antagonistic to the production of fruit by depriving the trees of that rest they are naturally accorded. It is not safe to remove the roof lights when the wood is soft and unripe, as it is then liable to damage by frost. Trees with that kind of wood set the fruit badly, stone it worse, and are always ailing something. They are radically wrong, generally at the roots, and lifting is a panacea for such ills. Exposure also aids the trees to retain their blossom buds, and the flowers attain to a much finer development than attends trees that are kept in alternating excitements and checks under glass. Even if there are no plants and the house is fully ventilated, the trees are kept constantly evaporating from the young wood when that is not checked by frost, and it can only aid trees that have unripe wood and are liable to suffer in severe winters. Proceed with the pruning, bringing matters in that respect, cleansing the house and trees, to as speedy a conclusion as possible. Houses with fixed roofs should be ventilated to the fullest extent in all but very severe weather, the hot-water pipes having had the water run off.

Figs.—*Earliest Trees in Pots.*—Early Violet, St. John's, and Angélique are the best for early work, the fruit being small and good, and in use several days before those of the two best of Figs for any purpose, namely, Brown Turkey and White Marseilles. A commencement should be made at once to have fruit of the first three ripe early in April, and of the two last-named at the end of that month, or early in May. The trees must have been well prepared for early forcing, not allowed to bear a heavy second crop of fruit, but have the points of last season's wood well stored with matter and bristling with embryonic Figs. They must also be clean and healthy. If the trees are not yet started dress them with an insecticide, taking care not to rub off the young fruit nor damage the shoots. Place the potted trees on pillars of loose brickwork, so that they may not settle with the fermenting material, and only have sufficient of the latter so that the heat about the pots does not exceed 65° until the trees are fairly in growth; but when the leaves are unfolding the bottom heat may be increased to 75° or even 80° at the base of the pots. Start with a top heat of 50° to 55° at night and 65° by day, gradually raising the temperature to 60° at night, 65° to 70° by day, but 5° less all round in severe weather, 70° to 75° with sun heat and moderate ventilation when the leaves appear is not too much, closing at 75°. Be careful, however, not to bring on the trees too rapidly, especially in dull weather, as foliage produced under such conditions is flabby and liable to scorch under bright sun and invite red spider and scale. Sprinkle the trees and house in the morning of fine days and again early in the afternoon to allow the foliage to become dry before night, and the floor can be damped later in the day if it has become dry. Supply water to the roots to keep the soil evenly moist, but not making it sodden, and not less in temperature than that of the fermenting material about the pots.

Fig Trees in Borders.—These are less under control than those in pots, and are not so certainly early forced, because the warmth encourages top growth before the roots are in a position to sustain it. They may, however, be started at the new year to supply fruit at the end of May and in June. The trees must be pruned, if not already attended to in that respect. Cut back the shoots that have attained to the limits of the trellis to where the successional shoots start, in order that they may occupy their places in the ensuing season, and thin out the crowded growths, also remove all long and bare limbs so as to give room for young and fruitful growths. Cut away entirely all elongated spurs, retaining only the short-jointed and promising where there is room for them. Loosen the trees from the trellis, thoroughly cleanse the woodwork with soap and water, the glass inside and outside with clear water, scald and limewash the walls, adding a handful of flowers of sulphur to each pailful of limewash, wash the trees with soft-soapy tepid water with a brush, doing this effectually, and taking care not to break the growths nor rub off the scarcely visible first crop Figs, then dress them with an insecticide. When this is completed tie the trees to the trellis so as the growths can swell without injury from the ligatures. Remove the remains of mulchings and the loose surface soil, and top-dress with a couple of inches thickness of good turfy loam, mixing with it a fourth of decayed manure and a 10-inch potful of bonemeal to every three bushels of the compost. Keep the houses dry, freely ventilated, and merely exclude frost, but a few degrees of that will do no harm.

PLANT HOUSES.

Epacris.—Any plants that only made puny growth during the past season and are healthy, as well as those that have not ripened their shoots sufficiently to flower profusely, may be cut well back. If done at

once such plants will start early, and invariably make vigorous growth next year. Keep plants subjected to this treatment in the greenhouse, and maintain a cool airy temperature.

Erica hyemalis.—Home-grown plants that are not going to flower profusely may have all the strong shoots cut nearly close back. Any young growths that are not more than 1 or 2 inches in length may be left as they are and allowed to extend. Plants treated in this way last year have flowering shoots upon them nearly 18 inches in length. Purchased plants generally do better the second year than the first after flowering. To flower the plants even satisfactorily the first year they must be potted as soon as they have started into growth.

Erica autumnalis (gracilis).—This is hardly worth retaining after it has flowered once. When grown with *hyemalis* we have never been very successful with it owing to it being so badly attacked by mildew. It can be grown fairly well, however, if given a place where the atmosphere is dry and abundance of air can be continuously maintained. A close atmosphere even for a few days means partial ruin to the plants. Be careful that none of these plants are allowed to become dry at their roots or they will be ruined.

Azalea indica.—One of the greatest evils these plants have to contend against is keeping them too dry at their roots during the winter months. At no season of their growth should they be allowed to become dry; once this occurs their silk-like roots quickly perish. Plants that are confined for years in their pots usually lose a very large percentage of their foliage owing to inactivity at their roots. Those that are repotted from time to time as they need more root room have darker and bolder foliage, which they retain well throughout the winter. Plants also that are potted in loam, leaf mould and sand, have better foliage, and make more vigorous growth than those potted in peat and sand. Destroy thrips directly these pests are observed. Syringe the plants well at least once a day when the weather is favourable. Complete the tying of these plants as early as possible.

Camellias.—Continue to give those that are swelling their flower buds, and are confined in pots, weak stimulants every time they need water. Syringe freely all plants that are being gently forced into flower, and maintain a moderately moist atmosphere about them.

Double Primulas.—Place these close to the glass, where they can enjoy rather a dry atmosphere and a little warmth. Air must be admitted daily to prevent their damping, which they quickly do when closely confined. Very small plants should be kept on a shelf, and any flowers they produce ought to be removed as they appear.

Mignonette.—Plants in 5-inch pots must not be allowed to become crowded; thin them out to five or six in each pot. Keep the plants perfectly cool, and as close to the glass as possible. Do not allow them to suffer by an insufficient supply of water, or their foliage will soon turn brown. Trained plants that have their pots full of roots may have a little artificial manure applied to the surface of the soil at intervals of a fortnight.

Zonal Pelargoniums.—Plants that have been kept as cool as possible may be placed in a temperature of 60°, when they will quickly come into flower. Be careful not to overwater these plants, or they will start into soft growth instead of flowering freely. Damp must be expelled from the house by the admission of air whenever the weather is favourable. At this period of the year the plants do well standing on a moderately dry base with the atmosphere as dry as possible. Not only are the flowers liable to damp, but the foliage as well, if too much moisture is kept about the plants.

Bouvardias.—Those that have been retarded by keeping them in the greenhouse may now be introduced into gentle warmth. The plants must be kept growing if they are to continue flowering. Water carefully, but give applications of artificial manure to the surface of the soil occasionally.

Justicia flavicom.—This plant should now have a temperature of 50° to 55°, in which it will open its beautiful plumes of bright yellow flowers. After the plants have flowered once do not throw them away, as they will come into flower a second and even a third time. This is a capital plant for a conservatory where a little warmth is maintained.

Acalyphas.—The leaves are falling from these where they have been kept in the conservatory, and only ordinary temperatures maintained. The plants may be cut back to within 2 inches of the soil, and if placed in a temperature of 60° and kept on the dry side they will soon break into growth. When about 1 inch of growth has been made the plants may be reduced and potted in the same size pots, or if they are only in small pots the drainage can be removed and the plants given a small shift. Cut-back plants with three or four shoots make excellent bushes.

Crotons.—Plants that become damaged by use in rooms and are needed for stock may be cut close back, and if the soil is kept rather dry the plants will soon break into growth and yield good cuttings. If a large stock of any particular kind is needed do not cut them down too closely.

THE BEE-KEEPER.

APIARIAN NOTES.

GARDENERS AND BEES.

I HAVE the honour of being on intimate terms with many ladies and gentlemen who keep bees and value their produce as much as they do the finest Peaches or Grapes. In some cases the bees are cared for entirely by their owners; but in others they are entrusted to their gardeners. Now, many gardeners regard the bees with indifference, being of secondary importance, which is a mistake. The majority of the class referred to are not only pleased with honeycomb, but proud because it is from their own bees and the gardener's management. Some gardeners are alive to that, and do all in their power to make the most of them for their employers' good.

FEEDING BEES IN WINTER.

I have received several letters referring to bees being still unfed. Deep snow and keen frost prevail now, keeping bees within doors. I have fed bees throughout a severe winter with syrup only; but the feeders were put on or under the bees during mild weather, and they were accustomed to it, feeding a little only when required. The bees never attempted to fly much, and so the experiments were satisfactory. "G. P.," a reader of this Journal, has applied for advice, whether it is too late to feed bees. It is certainly too late to postpone feeding till this late season; but, as above hinted, if the bees are in want it is never too late to feed them.

METHODS OF FEEDING.

The best way to feed now is to give a piece of honeycomb right over the cluster. A very small piece will do. Feeding with syrup, as a rule, may be safely practised from the middle of January and onwards. If the bees are in frame hives carry them into a dark room, and remove several empty combs by using carbolised paper. Do all this in the dark, or with a lantern that can be instantly darkened, so that the bees do not fly nor leave the hive. Fill the combs with syrup (Howard's plan) by dipping them slowly into it and then replace. Do not confine the bees, but let them remain in that position till the weather is calm and mild, at a temperature of 50°, or near that. The next best plan is to feed with candy right over the cluster. If the bees are in straw hives feed with candy only.

A CHEAP FEEDER.

Your correspondent asks for a feeder. Messrs. G. Neighbour and Sons, 127, High Holborn, will supply what is wanted. Their feeders have a perforated tin covering. I prefer a wooden or cork float or spars, also in two pieces. The following is the way to make a useful and cheap feeder:—Take a tin scoop about 10 inches long by three-eighths deep with turned-over edges, and any width to suit the fancy; 2 inches on legs is sufficient. The outer end should be made so that it closes the upper part of the entrance.

FOUNTAINS.

This may be a jar, glass bottle, or a tin. When the latter is employed an old powder-flask with a thimble requires no preparation other than to fit a piece of cork into the neck. Burn a hole with a wire through the centre large enough to let the syrup flow, but not so large as to let bees inside. Of course allowance must be made for the valve, which is simply a saw-handle screw, or common one let into a piece of lead. I use both sorts, and oil-can screws, instead of cork. The cork is, perhaps, the better of the two, as it is easily inserted or drawn out. An inch is a good width for the neck or thimble. The latter is passed through a hole in a wooden cover at the end of the trough outside the hive till its orifice is a little under top edge of trough, which should be either let into the block or filleted round to prevent stronger bees getting at the syrup. The size of the wooden cover depends upon the fountain, 6 inches square would do for a feeder holding from 6 to 10 lbs. of sugar.

PUNIC BEES.

As I am anxious to gather all the reliable information about these bees that I possibly can, will "C., Northumberland," kindly say whether the yellow colouring of the combs sealed by the Punic bees resulted from propolis or pollen? Of all the combs of Punic bees I have ever witnessed one case only came under my observation slightly propolised; other supers from them were paragons of beauty.

"C., Northumberland," states one good point of the Punic bees that many inexperienced persons denied, viz., the bees have gathered

and sealed honey which I presume was in supers. It is nothing unusual to see supers from one hive coloured while those of the same breed are beautifully pure. The difference depends on circumstances I have previously explained, and may do so again if required.—A LANARKSHIRE BEE-KEEPER.

*All correspondence should be directed either to "THE EDITOR" or to "THE PUBLISHER." Letters addressed to Dr. Hogg or members of the staff often remain unopened unavoidably. We request that no one will write privately to any of our correspondents, as doing so subjects them to unjustifiable trouble and expense.

Correspondents should not mix up on the same sheet questions relating to Gardening and those on Bee subjects, and should never send more than two or three questions at once. All articles intended for insertion should be written on one side of the paper only. We cannot reply to questions through the post, and we do not undertake to return rejected communications.

Primula obconica (*J. H. W.*).—We have seen many flowers as large as those you have sent, though perhaps not quite so well coloured. Continue your experiments and selections and you may obtain a more distinct advance another year.

Mushrooms in Boxes (*A. L.*).—A few days after inserting the spawn good loam should be spread on the surface and beaten down firmly to 1 inch in thickness, and hay spread on the soil to prevent the moisture escaping from it. Mushrooms grow well in a temperature of about 55°, a few degrees more or less simply accelerating or retarding their growth.

Variegated Elder (*J. H. V.*).—The leaf you send is too withered for its true character to be comprehended. The markings are probably faded now, and would be brighter and clearer during the period of growth. We have frequently seen variegated Parsley. If yours give you pleasure by all means grow the variety. We have previously heard of the variegated Tree Mallow reproducing itself from self-sown seed.

New Chrysanthemums (*Constant Reader*).—You cannot obtain more reliable information than is imparted by Mr. Molyneux in his descriptions of new varieties of Chrysanthemums. The first instalment of his matter appears in the present issue (page 509) and the remainder will follow in due course. When you stipulate for a certain number of varieties you must name the proportions you desire of the different sections, or a satisfactory reply cannot be given.

Grapes Faulty (*E. J.*).—The Grapes are rusted and blotched, and, though they shrivel off sweet, the stem of the bunch is shanked. The Vines must be in a bad condition, as the wood is weak, unripe, and discoloured, with the buds long and pointed. Probably the border is defective. Make an examination, and it may be found that the drainage is not efficient, or the soil has become too close and sodden. In that case the Vines should be lifted, efficient drainage provided, and the roots laid in fresh compost near the surface. In the absence of particulars we are unable to further advise you. You do not mention their age, distance of training, nor, indeed, describe them in any way to enable us to assist you satisfactorily.

Cutting Yew Trees and Hedge (*Welshpool*).—The best time to cut a Yew tree is when the fresh growth is about to be made, say during mild showery weather early in April. It may then be cut back to any extent, and it will push fresh growths and clothe the stems in a few months. If the hedge needs much cutting back it should be done about the same time, so as to allow of fresh growth being made quickly, and then irregularities can be cut away in August, which is the best time to clip Yew hedges annually. Yew is easily propagated from seeds, which should be sown in spring; the ripe fruits, after being gathered, should be mixed with sand and kept in a heap until sowing time. Many of the seeds will germinate in the first year, but the seed bed should be left two years, planting the seedlings in nursery rows in the autumn.

Raising Crab Stocks (*May*).—Crab stocks, so called, are raised by sowing the pips or seeds of Apples that are used in cider making, the seeds being separated from the pulp, washed, and dried. They should be sown as soon as they are available and the ground is in a suitable state, as they lose their vitality in a short time. If sown broadcast in beds the seeds must be thinly distributed, not covering them more than an inch deep with fine soil; but it is best to sow in drills an inch deep and 9 inches asunder; after depositing the seeds in them thinly cover with fine soil, and press close with the back of the spade. The situation should be open. In the autumn following the seedlings may be transplanted, placing them in rows about 3½ feet apart, and the plants

18 inches asunder in the rows, where they may remain until fit to bud or graft. True Crab stocks are obtained from seeds of the wild Crab.

Shortening Vine Canes (*Tom Smith*).—It would have been better if the laterals had remained, pinched at the first leaf, and to every subsequent sub-lateral leaf as made. That would have strengthened the canes, and the laterals could have been cut off when the foliage was turning yellow without starting the main buds. We should cut back the canes two-thirds of their length, and allow the part left to bear fruit next season, taking the bearing shoots, commonly termed laterals, from them at 15 to 18 inches apart along the canes, and allow each to bear a bunch of Grapes. From the extremity of each rod let a continuation cane issue and grow to within 2 feet of the length of the house before stopping it, keeping the laterals pinched to one leaf as made. The canes can be shortened one-third of their length another autumn, and being depressed every bud to their base will break. This plan is only advised where the object is to get rid of the old rods quickly, as you will be able to do in the year following, cutting off the old spurs so as to give the bearing shoots on the new rods space as they require it. It would have been more to the purpose to have stopped the present year's growths at 10 feet, pinched the laterals, and thereby strengthened the canes.

Destroying Mealy Bug on Vines (*An Old Subscriber*).—There is no winter dressing that is a sure remedy if applied to Vine rods only, for the pest hibernates in cracks, crevices, and beneath the old bark of the rods, also in those of the woodwork of the house, so that the difficulty is to reach the insects. Winter dressings, however, are good deterrents, provided the house be thoroughly cleansed. After removing the loose bark, but not peeling and scraping the Vines into the quick or live bark, they may be well washed with a solution of the compound named (Giehurst) at the rate of 4 ozs. to a gallon of water, applying with a brush, and reaching well into every angle, crack, crevice, and hole of the Vine rods, spurs, and stem. Repeat the washing as soon as the Vines are dry. Keep a sharp look-out for the mealy bug in early summer, and if any are found touch each with a small camel-hair pencil dipped in methylated spirit. But it is not only Vines alone that the insects secrete themselves, and that is why we say dressing the rods alone is only partially effective. The enemy lurks in all sorts of obscure places, especially where dry, such as on the under side of stages, in the soil near dry walls and hot-water pipes, on various plants, sticks, or flower pots, and fissures everywhere. It is to these that attention must be directed, as well as to Vines. It is not so much a question of any particular applications as of thorough methods of searching for and finding the insects, as when reached they are easily enough destroyed. One of the best methods of preserving and increasing the stock of mealy bug is to allow the leaves of Vines that are infested to shrivel and fall in the house, instead of removing them by hand when ripe and burning them. By this simple method thousands of insects have been destroyed.

Water from Colliery (*Aqua*).—The water is only very slightly saline or alkalic, and in neither respect injurious to vegetation, but you do not seem to have tested it for acid—that is, saturated blue litmus paper with it, which, if it contained an acid in excess, would turn red. Gypsum is of no use where there is not an excess of alkali, and the softness of the water is no barrier to its use for horticultural purposes. An alkali is the best neutraliser of acid, but nothing can be safely done in the case of impure water without an analysis and scientific guidance. Colliery water, however, is not as a rule injurious, pitmen and their families having to rely upon it solely in many localities. If you filtered it through charcoal it might be freed of its injurious properties, probably organic acids, as we have found peaty and bog water that was injurious to plants become quite clear (white), and not baneful when passed through charcoal beds alternating with layers of gravel. A safe manure for Azaleas and Rhododendrons is cow excreta, 1 peck, scalded in boiling water, then put in a bag, adding enough water to make 20 gallons, stirring well occasionally, and using the liquid when it is clear. Standen's, Thomson's, and other manures are good, but they must be carefully used, as a strong dose destroys the hair-like roots.

Double-glazed Greenhouses (*H. G. M.*).—The principle of double-glazing greenhouses was much advocated over thirty years ago as likely to economise fuel or heat, insure a more equable temperature, and lessen the injurious effects of the sulphurous laden fogs so prevalent in or near large towns and manufacturing centres. It was adopted in a few instances, but apart from the expense, it was found that what was saved in artificial heat was more than counterbalanced by the loss of solar heat through the refraction of the rays. Another objection was that the inner glass surface became coated with dust, and greatly obstructed the light and heat, so that, unless the upper surface or outside lights were moveable, and the inner surface kept clean, the light was only sufficient for Ferns and similar plants requiring a uniform temperature and moderated light. Double-glazing is not suitable for flowering plants and fruit trees, but it might be useful during the worst four months of the year (November to February inclusive) in large towns as a safeguard against fogs; indeed, it has been so used with advantage, the outer lights being moveable and so tight fitting as to exclude the baneful fogs. Double-glazed roofs are not a panacea for drip, for that is caused by the condensation of the moisture the air contains when brought into contact with cooler surfaces, and the inner glazing is only in a degree less cold than the outer, therefore the drip is only moderated. Grooved sash-bars are the best preventives of drip, as they carry off the condensed water to the bottom of the rafters or sash-bars, where it can do

no harm. The grooved sash-bars are supplied by most horticultural builders. Roof-heating is also a good preventive of drip, especially in frosty weather.

Making Charcoal (Nemo).—Charcoal is prepared by piling billets of wood in a pyramid form, with vacuities between them for the admission of air, setting fire to them, and covering them with earth. To carry out the work properly some practical knowledge is necessary, for though an inexperienced person can make charcoal, economy in the manufacture of it depends on the attention and adaptability of the operator to circumstances. The practised "charcoal burner" will so regulate the heat that the least yet necessary part of the combustible substance is consumed, part volatilised, together with a portion of water, so that there remains behind the largest portion possible of the carbon of the wood, retaining the form of the ligneous tissues. We have found it cheaper to buy than to make charcoal by unskilled hands. Charcoal is also made by heating the wood in close vessels (retorts or kilns), by which the volatile parts are driven off, the charcoal remaining in the retorts; it is not so dense as that obtained by the other process. The charcoal of chemists is more carefully prepared—deep black (not brown) in colour, brittle, porous, inodorous, and tasteless. Owing to its porous nature charcoal absorbs a large quantity of air or gases at ordinary temperatures; that made from heavy wood 90 times its volume of ammoniacal gas, 85 hydrochloric acid, 35 carbonic acid, 9.25 oxygen, and 1.75 of hydrogen. Charcoal, in absorbing effluvia and gases, is useful as a manure. It is one of the most indestructible substances known, and has no injurious effect on the roots of the most delicate plant, those of Orchids often clinging to it better than to anything else. The quantity to apply, crushed or in lumps, to the soil for plants may vary from a sixth for Orchids to a sixteenth for Heaths, a 9-inch potful answering well for 3 bushels of compost for fruit trees. As a manure its value rests on absorbing carbonic acid and other gases, yielding them up to the plants as required for nourishment. About 40 bushels of charcoal dust is a proper dressing per acre, applied in early spring or when the crops are appearing above ground as a top-dressing. Of course Vines are checked by lifting, the extent of the check depending on their condition and the skill of the operator. Many Vines have been greatly improved by the process when properly carried out.

Names of Fruits.—*Notice.*—Special attention is directed to the following decision, the object of which is to discourage the growth of inferior and promote the culture of superior varieties. *In consequence of the large number of worthless Apples and Pears sent to this office to be named, it has been decided to name only specimens and varieties of approved merit, and to reject the inferior, which are not worth sending or growing.* The names and addresses of senders of fruit to be named must in all cases be enclosed with the specimens, whether letters referring to the fruit are sent by post or not. The names are not necessarily required for publication, initials sufficing for that. Only six specimens can be named at once, and any beyond that number cannot be preserved. (*J. F. D.*).—The Apple is no doubt Little Herbert, and is not of first-rate quality. The Pear is Lewis, a variety of American origin. (*W. J. Bligh*).—1, Old Hawthornden; 2, Beauty of Kent; 3, Alfriston; 4, Blenheim Pippin. (*W. S. Payne*).—50, Ross Nonpareil; 32, Waltham Abbey; 16, Blenheim Pippin; 53, Cellini. (*J. D.*).—1, Fearn's Pippin; 2 and 3, not known, worthless; 4, a wilding; 5, too much decayed; 6, Napoleon.

Names of Plants.—We only undertake to name species of plants, not varieties that have originated from seed and termed florists' flowers. Flowering specimens are necessary of flowering plants, and Fern fronds should bear spores. Specimens should arrive in a fresh state in firm boxes. Slightly damp moss, soft green grass or leaves form the best packing, dry wool the worst. Not more than six specimens can be named at once, and the numbers should be visible without untying the ligatures, it being often difficult to separate them when the paper is damp. (*C. O.*).—The specimens are much too small to identify with certainty. They are probably as follows:—1, *Opuntia microdasys*; 2, *O. leucotricha*; 3, *Euphorbia Caput-Medusæ* (?); 4, *Echinopsis Eyriesi* (?); 5, *Aloe glauca*; 6, *Haworthia cymbiformis* (?).

COVENT GARDEN MARKET.—DECEMBER 7TH.

Trade slow, good supplies with no alteration in prices.

SWINE.

INCLUSIVE of all classes, from porker to bacon, hog is the familiar old term of swine; that is our reason for using it now, as we desire to give a few useful hints on swine management once more. Never has the pig been held in greater respect than at the present time, for it has been so profitable this year that on farms where it is bred largely it has literally proved worthy of Paddy's designation of "the gentleman that pays the rent." In common with other things in agriculture, swine are subject to cycles of extremes. Last year they were ruinously cheap to those who bred them; this year they have proved comparatively far above sheep or cattle in value, or in other words, they are highly profitable. How, indeed, could they be otherwise, with corn so cheap and pork so dear! Yet, in a recently published computation of losses in agriculture this year, £1,000,000 is stated to be the amount in round numbers lost to the farmer from a reduction of 5s. per head in the price of pigs!

The farmers' condition is bad enough, but such misleading and altogether erroneous statements will do nothing but harm to it. It is notorious that pigs have been dearer this year than for some time previously. In the paper containing the extraordinary statement which we quote, the market review said: "Pigs are dearer, if anything, especially for neat porkers, which are worth 7½d. or more in some markets"—an extraordinary and highly remunerative price per pound. The same review also said: "There is a fresh breeze of revival in all branches of the meat trade. There is a better feeling all round, and values are the turn better even for the better description of stores."

"Neat" porkers are now in much request, and there is nothing more profitable than compact, well-fed, well-bred porkers of about 50 lbs. weight, in the best dead meat markets. Mark the term "neat," which means to the dealer a compact chubby animal, carefully dressed for sale, tempting in appearance in the clean, healthy hue of its flesh and skin, in striking contrast to the dark colour and flabby texture of inferior porkers. At the home farm porkers are also wanted for home

consumption now and onwards till spring. Large hogs are also coming in now for the annual supply of bacon, and where a large number of flitches are required it is well to begin the pickling in good time. We always prefer smoked bacon, and as a general rule keep the bacon a month in pickle and a month in the smoke, taking care to use non-resinous wood, such as oak or beech, in the smoking house.

If mild-flavoured bacon is wanted it can be supplied during the winter by curtailing the time of salting and smoking, but we strongly advise home farmers not to attempt supplying mild cured bacon for summer, because of the risk of loss from the half cured flitches becoming putrid. All bacon, therefore, for use in the summer must be well salted and dried; it must also be protected from flies and be kept in a cool dry room. Hams should be placed in paper bags for the smoking, and be frequently examined for flies or maggot in the bacon room. Very seldom indeed do we meet with a fine-flavoured ham, which is a very different thing to the ordinary ham pickled in brine. Here is the recipe which we published some years ago in the *Journal of Horticulture*:—For a ham of 20 lbs. take 2 lbs. of common salt, 3 ozs. saltpetre, 3 ozs. bay salt, 3 ozs. shallots, 1 oz. coriander seed, 1 oz. juniper berries, 4 lbs. treacle, $\frac{1}{2}$ lb. beef suet. With these ingredients make enough pickle to cover the ham, turn it every day for a month, then smoke for another month, when it should be ready for use at once, or it may be kept for a year suspended from a hook in the bacon room. The delicious flavour of hams so cured is indeed a revelation to those who taste them for the first time, and we cordially commend the recipe to the notice of new readers of the Journal.

Breeding should go steadily on the year round from the time young sows are six months old. Never keep large heavy sows; they consume enormous quantities of food, become unwieldy, crush many of their progeny to death, and are altogether undesirable. They fatten readily enough, command a good price, and should always be sold. The period of gestation is sixteen weeks, so that it is an easy and quick affair to raise a large stock of pigs, and under good management they contribute materially to the profits of dairy farming, perhaps more so now than they have done for a long time. Cheap corn mixed with milk is the food to promote a healthy quick growth. Pigs of all kinds are much in request, and a considerable surplus over home requirements is now most desirable, both of porkers for market and store pigs of six or eight weeks old.

WORK ON THE HOME FARM.

Tenants of small dairy farms do not keep enough heavy horses for carting much beyond milk and fodder. It has therefore been a boon for them to have the yards and surroundings of their homesteads regravelled by the landlord. With this work the yard drains have also been examined and repaired, unsound roofs made waterproof, interiors of cow hovels, piggeries, and stables whitewashed, woodwork of rough buildings tarred, and of superior buildings painted. Fences and gates have also been repaired or renewed. New hovels for cattle are in course of erection out on pasture as well as near yards. For such buildings preference is given to corrugated iron sheeting for the roofs and sides, which rest on a few courses of brickwork, with iron piers and bracings. The feeding manger, or "foost," as it is called in the Midlands, is of brickwork; the floor is also of brick paving, which is certainly not so slippery as cement concrete; but the latter is the more cleanly. These corrugated iron buildings have carved roofs, are low, compact, yet fairly commodious, and are well ventilated; they are the speciality of a Liverpool firm, and we are much pleased with them.

Each hovel opens into a yard enclosed by a fence of the corrugated sheeting securely fastened to a stout frame, which makes a thoroughly snug enclosure for cows or store cattle, which have thus shelter from both wind and rain. The promise of these hovels led to the building of hayricks close by in anticipation of winter requirements. With hay already up to £6 per ton, there are anxious forebodings of food difficulties if the winter proves long and severe. The new hovels and yards will certainly aid economy in feeding, as exhaustion and loss of tissue from exposure is at an end among the stock. Condition will be more easily sustained, and the food turned to better account than of yore.

Such a short supply of hay is a reminder of the folly of not having a few acres of every dairy farm under the plough. Rye, Rye Grass, Clover, Lucerne, mixed seeds, Sainfoin, green Maize, Cattle Cabbage, Thousand-headed Kale, root crops, and, above all perhaps, some Oats, and Oat straw would all be available then. The farmer who has three

or four large Oat stacks now need have little anxiety about small hayricks or a long hard winter, provided he has been so prudent as to keep the number of his live stock well within bounds.

ROOT AND SEED STANDS AT THE SMITHFIELD SHOW.

THE stands of roots and seeds at the Smithfield Cattle Show, which opened on Monday, December 5th, at the Agricultural Hall, Islington, were this year quite up to their usual standard. The Swedes and Mangel Wurtzel were especially fine, whilst in some cases Potatoes and garden root crops were well represented. Apples, too, in one or two instances were noticeable; though considering that fruit growing is now recognised as a panacea for agricultural depression, fruit was not so extensively exhibited as might have been the case.

Amongst other stands, that of Messrs. Sutton & Sons, Reading, made a most imposing display. Here we found Mangels, Swedes, and other roots in splendid condition. The Swedes and Mangels were arranged in collections, the varieties being Crimson Tankard, Intermediate, Oxheart Yellow, of Mangel, and of Swedes Crimson King and Champion were staged. The roots of all were remarkably clean and well grown. Messrs. Sutton also had a dozen varieties of their disease-resisting Potatoes, conspicuous among them being Windsor Castle, Satisfaction, Abundance, and Triumph. Cabinets of grass and agricultural seeds were also well represented in this stand. It may be of interest to mention that two of Messrs. Sutton's customers (Mr. R. H. Major, Langley, Slough, and Mr. E. Hobbs, Sonning) won two 20-guinea cups, which were exhibited on the stand.

Near the stand of the last named firm that of Messrs. J. Carter and Co., High Holborn, was situated. This, also, made a grand display, a splendid exhibit of Elephant Swede being most noteworthy. This is a stupendous root of a clean appearance. The Mangels were likewise particularly fine, the best being Warden, Yellow Globe, Golden Intermediate, Mammoth Long Red, and Improved Golden Tankard. The disease-resisting Potatoes shown by Messrs. Carter & Co. also attracted more than a passing notice, the tubers being clean, large, and of perfect symmetry. Growing examples of Carter's grass seed for laying down land for permanent pasture were likewise exhibited.

The stand of Messrs. E. Webb & Sons, Stourbridge, also deserves special mention. This was well arranged. Webb's new Swede, "Giant King," was exceedingly fine, the roots of this being of a large size and excellent shape. Potatoes were also well shown by this firm, Stourbridge Glory, a new main-crop kidney variety, being exceptionally good. Wordsley Pride, a second early kidney variety, was likewise noticeable, and the same may be said of other varieties. Seeds of various kinds were well represented in this exhibit.

Messrs. Dicksons (Limited), Chester, had a stand of natural Grasses and Apples, the latter being well grown and brightly coloured. Among other varieties Golden Noble, Mère de Ménage, Blenheim Orange, Lord Derby, Cellini, and New Bess Pool were most noticeable. Messrs. Harrison and Sons, Leicester, had a stand of roots, comprising Swedes, &c., in grand condition. Vegetables were shown by this firm, including Potatoes, Beet, Onions, Early Milan Turnip, and Carrots. Seeds were also well represented.

Messrs. J. Cheal & Sons, Crawley, were represented by a stand of roots, seeds, and a few dishes of Apples. The latter attracted considerable attention, the samples shown being large and brightly coloured. Messrs. Jarman & Co., Chard, made a display of roots, vegetables, and seeds, the Onions and Carrots being excellent.

There were, as usual, a large number of implements, and amongst others the stand of Messrs. Ransomes, Sims, & Jefferies, Ipswich, was noticeable.

REMARKS.

27th.—Fine and sunny almost throughout.
 28th.—Overcast all day, fair evening.
 29th.—Overcast morning; wet from 2 P.M. to 5 P.M.; bright night.
 30th.—Unbroken sunshine from sunrise to sunset; cloudless night.
 1st.—Overcast early; incessant rain from 11 A.M. to 6.30 P.M., dull and drizzly after.
 2nd.—Unbroken sunshine throughout; lunar halo in evening; rain at night.
 3rd.—Dull, foggy and drizzle early; steady rain from 10.45 A.M. to noon; some sun in afternoon and rain again at night.
 An average week as regards temperature, with bright sun on some days; rain above average.—G. J. SYMONS.

IN most gardens there is now a considerable amount of space uncropped, and it should be decided at once when and what steps shall be taken towards preparing the ground for next season. Soils vary so surprisingly even before being much cultivated that no general rules as to their treatment can well be laid down, so much depending upon circumstances. Some land would be best let alone till near the time cropping is to take place, but other ought to be dug at once; in some cases bastard trenching would be beneficial, and ordinary trenching might advantageously be resorted to in others. When and what to use, if there is any choice, in the way of manures also require consideration, and soils may be greatly improved by the addition of a variety of other substances, soluble or otherwise.

HEAVY SOILS.—These are, perhaps, the most frequently met with, and under good cultivation they usually prove the most fertile. Heavy ground naturally consists largely of clay, and requires to be treated with the greatest judgment. When first taken in hand trenching of any kind had better be left alone, but the drainage ought to be perfected. As early in the winter as possible the ground should be dug with a fork to the full depth of the latter, and only partially decayed strawy manure, preferably from stables, freely buried in the trenches. This kind of manure is slow in decomposition, and acts mechanically in the direction of dividing naturally too close soils. Frosts, winds, sunshine, and rains will further break down or pulverise the roughly laid-up spits, and if a spring dressing of fine sandy soil, leaf mould, fine ashes, spent tan, peat, mortar rubbish, or burnt clay is forked in the improvement effected in a comparatively short space of time will be of a permanent character. Caustic lime applied at the rate of 1 ton to a quarter of an acre of ground is a very excellent form of dressing, either for heavy soils newly broken up or for any that have been freely manured of late years, and stand in need of correction. Place it in 4-bushel heaps, cover with soil till it is slaked, and then spread over the surface of ground that has been dug some few weeks in advance, and fork into the surface. Never bury lime deeply; it will find its way down quickly enough. The other substances, whether in mixture or separately, should also be well mixed with pulverised soil, and not deeply buried. After the top spit has been considerably improved, and exhausted of some of its fertility, the time has arrived for double digging, a process to be presently described. There are some soils that contain so great a per-centage of clay that it is scarcely possible to greatly alter their character quickly. In some few cases it is unwise to even dig them many weeks in advance of cropping, some clays when pulverised assuming the consistency and character of birdlime. The majority of heavy soils, however, should be roughly dug as early as possible in the autumn or winter, and if soon pulverised pay well for being forked over, without disturbing the manure underneath, in February or early in March; for often the surface is finely divided when cropped, but underneath are great hard and cold lumps, which remain in that state all through the summer. The second turning discovers and brings these to the surface to be pulverised. On no account interfere with retentive soils in wet weather, or the surface will be made pasty before it is turned in, and be years in recovering its original fairly open state. Nor should cowyard manure be used if that from horse stables can be

had. The former sours the land badly, making it heavier and colder than before its application; whereas strawy manure, as already stated, acts very differently. Chemical manures are far preferable to those of a solid nature obtained from milch cows more especially. All wheeling on heavy land should be done as much as possible either when it is frosted over or in a dry state, planks for wheeling on being necessary at all other times.

MEDIUM SOILS.—There are a great variety of these, and in many cases there is a good depth of free working, yet fairly retentive soil, which is improved by deep cultivation from the outset. As the soil would contain 20 per cent. or more of clay, often of a sandy or gravelly nature, it is yet inadvisable to be too hasty in bringing up much of the subsoil to the surface. First prepare it by bastard trenching and the admixture of decaying substances, such as vegetable refuse and solid manure of any kind, and then a reversal of the spits, if clay is not very abundant, may safely be attempted. Mixed farmyard manure is the best for these medium soils, and they will stand plenty of it. Being fairly retentive, too, the manure in a half-decayed state may be dug in now, and the surface of the ground laid up to be improved by, sweetened and perhaps broken down by frosts. A dressing of lime is usually required about once in seven years. Advantage should be taken of frosty weather to do all the wheeling necessary on these medium soils.

LIGHT SOILS.—Ground of a very free working character has its disadvantages as well as the rest. In particular sandy soils are far too non-retentive of moisture to be very fertile, and not till they have been greatly increased in depth and retentiveness will they ever be much more satisfactory. If the subsoil is not of a very chalky or gravelly nature much may be done towards improving the physical properties of the soil by first bastard and then ordinarily trenching it. Clay sometimes underlies these light sandy soils, and bringing about 3 inches of this, or even less, to the surface and well mixing with it, would completely change its character for the better. It is to the absence of clay that the pooriness of light sandy soils is to be attributed. If either clay or marl can be obtained it would pay well to spread about twenty loads of this over a quarter of an acre of ground, doing this either before or early in the winter. It must be left exposed to all weathers till broken down to a finely divided state, when it should be forked into and mixed with, not buried under the surface soil. This admixture of clay or marl has the effect of at once making the ground more retentive of moisture as well as fertilising agents, including any that may be absorbed from the atmosphere. If no clay can be added it is not advisable to either manure or dig long before the ground is wanted for cropping purposes. Should the former be buried in the ground much before the roots of plants are there to assimilate the food thus placed within easy reach, the chances are much of it will be washed away down the drains and wasted. Better build the manure up into a square heap (it ought to be well decomposed for light soils), placing a layer of fresh soil underneath and another on the top, and thereby preserve its best properties and increase the bulk against the time it is wanted. Roughly digging or ridging light soils in the autumn or early winter is a mistake, for the simple reason that they are already too finely divided. Failing a dressing of clay or marl, collect a great heap of road trimmings, road scrapings, decayed garden refuse, and good cowyard manure; and a heavy spring dressing of this, or when the ground is dug, will serve to greatly improve its depth, retentiveness, and productive character.

BASTARD TRENCHING.—This process consists of breaking up the soil two or more spits deep without changing their positions, thereby increasing their depth and fertility without running any risks of bringing poor unworkable subsoil to the surface in injurious quantities. Some few soils, principally those of an alluvial or deposited character, may safely be trenched outright, but by far the greater proportion would be little short of ruined for years if

other than bastard trenched at the outset. Having a breadth of clear ground, now is a good time to bastard trench this, it being of importance that the mass should settle down considerably prior to being cropped. Commence by marking out a width of 30 inches across one end, and from this wheel the top spit and loose soil, or "shovellings," left in the trench back to the opposite end, or where it is intended to finish. In the bottom of the trench deeply fork either manure or other substances that will slowly decay and improve the character of the subsoil, well mixing it in. Mark out another 30-inch width, and deposit the top spit of this and shovellings on the top of the subsoil just previously broken up, and so on with similar widths till the breadth is completed, the last trench being completed by the addition of soil wheeled back. The shovellings are usually quite fresh soil, being loosened from just below where ordinary digging reaches, and the admixture of these with the somewhat stale, or it may be over-rich surface soil, gives it just the amount of correction needed. If of rather a clayey nature take an early opportunity of well mixing it with the top soil, or otherwise it may impede operations, especially in the way of seed sowing next spring.

TRENCHING.—Heavy ground that has been previously bastard trenched two or three times will most probably have the subsoil sufficiently well prepared for bringing to the surface, and some few naturally deep, free working soils there are which as before hinted may be trenched outright. It must be borne in mind that a spit of fresh clayey subsoil when first brought to the surface may run together badly, and be worked and cropped with the greatest difficulty for several years after. Trenching, therefore, ought not to be recklessly resorted to, especially on a large scale; experimenting on small plots being advisable, in order to prevent a huge mistake being made. Ordinary trenching should be commenced by first digging a trench 20 inches wide and two good spits deep, the whole of the soil being wheeled back to where the work is to be finished. Mark out the next 20-inch width, and from this dig and throw the top spit into the bottom of trench in front; on the top of this depositing the bottom spit of the second trench, leaving it in as rough state as possible for frosts to operate upon. Subsequent operations to be merely a repetition of this, the last trench being filled in with the soil wheeled back. In this manner the positions of the two layers of soil will be completely reversed, this operation greatly increasing the depth and productiveness of the whole mass, the fresh unexhausted soil being brought up where it can be better acted upon by the atmosphere, and be more within the reach of the sun's warmth and the roots of any crops growing upon it. When ground is being trenched for Rhubarb, Globe Artichokes, Asparagus, or any crop requiring a rich deep root run, plenty of solid manure or decaying vegetable matter may well be mixed with each spit, but for all ordinary crops no manure ought to be needed. —W. IGGULDEN.

SHOWING AND JUDGING HARDY FLOWERS.

ALLOW me to heartily thank you for giving prominence to Mr. Shanks' notes, and for your remarks thereon. I do hope we may have a few stirring letters on the subject, and that they may result in more explicit wording in the schedules of the various shows, and an extended love for and interest in "hardy border flowers." —A SHOWMAN.

THERE has been considerable difficulty at flower shows in dealing with classes described as hardy herbaceous plants. The principal difficulty is to decide what are hardy plants. This is in fact an indefinite expression, whether applied to plants which are hardy in one part of the country or the reverse in another, and even so in two gardens in the same neighbourhood, where the situation and aspect differs.

There are plants which grow out of doors in the Isle of Wight which could not be so grown in the north, and it would hardly be reasonable at a northern show to exhibit such a plant grown in a house in a class of hardy plants.

My suggestion is that in framing schedules this class should

be described as "Herbaceous perennials, grown in the open." This would, I think, obviate the difficulties in future. It would, of course, exclude hardy plants grown in a house, and I think they ought to be excluded.—B. (*Amateur*).

YOUR suggestion of "hardy border flowers" for "herbaceous" and perennial is good, but if you look at our Diss prize list, which I enclose, I think you will say that it is so clear that "he who runs may read." We have classes for annuals and for biennials and flowering shrubs, and these are excluded from the perennial classes. With Mr. Shanks I approve of varieties and not species, especially in the larger classes for thirty-six or twenty-four bunches, but I would consider two bunches of one variety in a class for twelve bunches not worth full points.—F. PAGE ROBERTS.

The following is the description of the classes sent by our correspondent:—Class 12, "Twelve Bunches of Annuals;" 13, "Thirty-six Bunches of Hardy Perennials (distinct);" 14, "Twenty-four Bunches of Hardy Perennials (distinct)." (Exhibitors in Classes 13 and 14 may not show in Class 15.) 15, "Twelve Bunches of Hardy Perennials (distinct)." 16, "Twelve Bunches of Hardy Perennials (distinct). Open only to those who do not employ paid assistance of any kind in their culture." 17, "Collection of twenty-four Hardy Perennials, to be shown separately. One or two spikes of each variety." (Classes 12, 13, 14, 15, 16, and 17 must be shown as cut blooms, including hardy flowering bulbs; excluding biennials and flowering shrubs). 18, "Twelve Bunches of Biennials and Flowering Shrubs."

[Is it not singular that hardy flowering bulbs are eligible in the class for annuals? After the word "distinct" in those classes the word "kinds" should be inserted, unless several varieties of the same kind are admissible. Probably local exhibitors know what is meant, but that is not sufficient for general acceptance.]

WHAT a prolific mother of disputes and wrangles, of difficulties and trials, of worries and annoyances! Happy is the Hon. Sec. who has been fortunate enough to steer his bark through these quicksands without wounding the tender feelings of an exhibitor or treading on the more sensitive corn of some cantankerous committeeman, the latter possibly a person utterly ignorant of horticulture. Let the agenda paper contain "consideration of schedule," and however cold the atmosphere externally it will be quite warm within, perhaps even hot with a thunderstorm to cool the air. Many such meetings have I attended in the past, and many a fierce battle have I seen, whilst I have been trying to guide the little bark into smooth water. Now, though discussion on the subject may do some good, it will remain a troublesome point. When a society is fettered by a scanty supply of the sinews of war printing is often felt to be a terrible expense, hence notes and explanations are often omitted, and as a result errors occur. It is quite possible, too, that in the infantile days of the society judges were selected who possibly did not detect the difficulties, or, discovering, passed them over.

Such was the case with a society to which I was once honorary secretary; I well recollect the first check. A leading gardener in the neighbourhood was asked to judge. At the class for vegetables, so many varieties, I was appealed to. The exhibitor had staged, as he considered, say ten varieties of vegetables, but he had two sorts of Lettuces staged as one variety. "Look here, Mr. Secretary, you have a schedule, and you say ten varieties, but this exhibitor has eleven, for he has two sorts of Lettuce as diverse as Cabbage and Savoy." Well, I think the disqualification was made. The following year I insisted on an explanatory note. So it ran: That different sorts of the same flower or vegetable would be considered "two varieties" and judged accordingly.

Such a rule holds as good in flowers. Take the class on which particularly Mr. Shanks (page 497) writes. Two varieties of Rose, for instance, may be almost as distinct in appearance as different species, and yet may be a great addition to the beauty of a stand containing twenty-four sorts of the flower. Varieties of Liliums, Gladiolus, or Gloxinias would be equally grand additions, and would be met by a similar note as to the meaning of the word "varieties." At this same Show I introduced a class for "flowers grown out of doors," and it became very popular, and of course excluded outdoor flowers that had been kept under glass, one of the difficulties Mr. Shanks mentions. Here, however, comes in the good faith of the exhibitor, as I calculate it would take an extra sharp judge to detect those grown under glass. It must always be remembered by exhibitors that where the competition is very keen twenty-four or twelve varieties made up of true varieties would rank higher, if equally good, than the same number containing three sorts of Gloxinia, two Liliums, &c., and where an exhibitor

could stage all varieties I apprehend he would and should stand a better chance of winning.

I think the point of stands of cut flowers might be made easier thus: if they came after, say, the cut Roses, Gladioli, Carnations, and Phloxes, those flowers for which a class is provided; if it stated "For so many varieties, two or three prizes, flowers for which a class has already been provided not to be shown in the stand." I also found a class at the end of the cut flowers for "any other variety not previously classed, so many blooms," most attractive, a large variety of flowers being thus exhibited which had no place before; the competition became so strong that two first, second, and third prizes were ultimately offered.

The dimensions of bunches it is difficult to arrange. First, it seems to me to be necessary to impress on exhibitors that a stand with bunches nearly on a level as to height and size carry an extra charm from their evenness. This even character cannot be gained if the exhibitor is tied to showing, say, five stems in a bunch; the point is possibly better achieved if the schedule says, "not more than five stems in a bunch." This way, a grand stem say of perennial Phlox stands by itself and is not disfigured by being squeezed against two or three other stems. Five stems of well grown Salpiglossis will make an equally good show; whilst two, or at most three, stems of Gladiolus are sufficient. Mr. Shanks' suggestion as to the size of tubes I do not think possible, because it is unlikely that all societies would agree as to size; and next, it entails a degree of expense on exhibitors of small means, the very persons who want encouragement to exhibit. It is not everyone who can afford special Rose tubes or Chrysanthemum tubes.

I confess I lean more to your suggestion of "hardy border flowers" rather than "herbaceous" or "perennial." We do want to make schedules as simple as possible, for though gardeners of the present day are much better educated than formerly, there are still some of the older ones left who have not had the same advantages, and it often happens that the whole matter is left in the hands of the gardener. Everyone has a lingering preference for his own infant, and even to yours I prefer, "For the best stand of flowers, grown out of doors, so many varieties," and this would include shrubs and even trees; to this addition, I, for one, see no objection.—Y. B. A. Z.

[A class thus worded would admit flowers of tender bedding plants; also if a person made up his stand of twelve bunches with three varieties each of Carnations, Roses, Liliums, and Delphiniums, or even twelve distinct varieties of any one of those kinds, he could not be disqualified.]

EVERYONE really interested in this subject must be glad to find it again being discussed in the pages of the *Journal of Horticulture*. During the past three years I have frequently been perplexed in order to come to an equitable decision when judging herbaceous and hardy flowers. We have no authoritative data to work upon. The wording of the schedules is ambiguous in most instances, and as a matter of fact I have known of instances where members of a Committee appointed to draw up a schedule have been ignorant as to what is generally understood by the term herbaceous. Considering how great and thoroughly representative is the competition in these days in the classes devoted to herbaceous and hardy flowers, the time has surely come for the formation of a representative society which shall frame rules and have an authority on the lines of the National Rose Society.

Surely such names as Wolley-Dod, Ewbank, D'Ombrian, Page-Roberts, A. L. Fellows among the parsons, with T. S. Ware, P. Barr, Backhouse, and George Paul of the trade, would inspire the confidence of every local society in the kingdom. Who will make the start? There is no time to be lost, and there are several questions to be definitely decided, one of the most important being, "Are all bulbous plants to be excluded in a stand of herbaceous flowers?"

We had letters on the subject last autumn, but the matter was dropped just when one thought it was about to be pushed through to some final result. This is the quiet season, so the *Journal* will, I feel sure, find room, now that the shows are over, for the opinions of those best qualified to air them. We want the opinions of experts rather than those general and casual controversies which so often end in discussions *et preterea nil*. By this means we shall get some definite lines upon which to set to work.

The other question raised by Mr. Shanks is also an important one—i.e., the showing of hardy flowers. Nothing can be more inartistic nor hideous than the flat squashed-up huge bunches of annuals, biennials, and perennials, such are now staged at most shows—no foliage, no grace, nothing to show the habit of the plant; in fact, nothing to teach those who come to learn; and surely the chief object of our shows should be to edification in

floriculture. I sincerely hope that Mr. Shanks' letter and the Editor's remarks, on page 497, will be the means of some real practical movement towards the end all lovers of herbaceous and hardy flowers have at heart.—J. A. WILLIAMS.

CROCOSMA AUREA MACULATA.

THE old type, *C. aurea*, which is a well known plant in gardens, is sometimes designated *Tritonia aurea*, and *Crocantus mossambicensis*, under either of which names it may frequently be found. It is a native of Kaffraria, Natal, the Transvaal northwards to Mozambique, and the

FIG. 69.—CROCOSMA AUREA MACULATA.

Zambesii highlands, and although usually grown as a greenhouse plant, it will also be found a valuable addition to open air flowers. It is quite as hardy as the new race of *Tritonias* lately introduced through Lemoine & Sons of Nancy, which along with the *Crocasma* get injured in severe winters if not well protected.

The same may be made to apply to the handsome variety *maculata*, of which we give an illustration (fig. 69). It is also to all intents and purposes a greenhouse bulb, but it may readily be grown in the open ground, and either lifted and protected in frames, or protected in the open ground with any loose open material at hand. This variety is by far the best of this group, and one of the very showiest and most useful of summer flowering bulbous plants. The flowers are quite half as large again as the type, the three inner segments being marked near the base with red-brown blotches. Seen in a group it gives a most

telling effect, and in this way is superior to *C. aurea imperialis*, in which the flowers are large and of a brilliant orange shade.

Both varieties are now in the trade, and should be noted by all on the outlook for showy probably hardy plants. There is no reason, at any rate, why they should not be grown much in the same way as the *Tritomas*, and be equally as hardy as those very popular garden flowers. They are all increased by division and seeds, and make good plants for growing in pots in the greenhouse.—M.

THE APPLE—VARIETIES AND HOW TO GROW THEM.

[A Paper read by Mr. W. CRUMP, The Gardens, Madresfield Court, near Worcester, at a meeting of the Birmingham Gardeners' Association.]

DURING the last few years the Apple-growing question has been an absorbing topic, and an immense amount of both common sense and nonsense has been written upon it; therefore it is no easy matter to say much upon the subject without laying oneself open to a suspicious charge of plagiarism or copying somebody, an act I, in common with all honest men, would scorn to do knowingly. I purpose to confine my remarks strictly to such facts that have come within scope of my own experience; at the same time I am fully cognisant of the difference betwixt knowledge thus gained and the necessary eloquence to explain such clearly to others.

In the first place there is no hardy fruit grown in this country of such national importance, nor so wholesome as an article of diet, as the Apple, whether cooked or consumed in its natural but ripe condition. Its various uses and value in domestic economy are familiar to all of us. It has become a recognised fact, that the average Englishman does not consume half enough ripe fruit of this kind, probably owing to his inability to procure it good and cheap.

In the second place we have positive evidence that there is no country on the face of the globe that can produce Apples of better quality than certain counties and appropriate places in England. I particularly wish to emphasise this, as there are pessimists about holding contrary opinions, who are ever ready to decry every modern move, and to raise obstacles in the path of progress; in this case pointing to the huge annual increasing importations from the colonies and elsewhere as conclusive evidence in their favour.

I gratefully acknowledge the value to the public of these high-class importations, and especially to us as growers, for the object lessons thus taught have been the means of arousing us from our Rip Van Winkle-kind of sleep, and showing us plainly how we neglected the cultivation of our Apple trees during the greater part of the past century. Such unpleasant facts have aroused John Bull, and doubtless in less than another decade foreign importations will decrease, at certain times of the year at all events, for now everybody will be growing Apples, and everybody will know how to grow them. If they do not know how it cannot be for want of opportunity in these days of technical education and an educational code which includes rudimentary horticulture. The latter I have long desired to see for obvious reasons. Nay, even the Lord Mayor's Show is now considered incomplete without a representation of Apple growing.

The continued depression in agriculture, and the unprofitableness of corn growing, have also been the means of turning the attention of statesmen, landowners, and others to what should have been done years ago as regards planting fruit trees. There are now estates which have established experimental hardy fruit gardens for the purpose of testing varieties suitable to their respective districts, and worked in conjunction with the raising, planting, and cultivating fruit trees on the most approved methods and sound commercial principles. This is done to improve the value of properties, as well as stimulate the home fruit growing industry amongst farmers, allotment holders, amateurs, and cottagers upon these estates—commendable objects surely.

Circumstances during the past ten years have placed me in charge of one of these experimental and interesting plantations of some 3 to 4 acres in extent. We have upwards of 230 varieties of Apples under trial, and my remarks are mainly based upon the results of these experiments. It would be tedious to individualise these varieties, but I have taken careful notes of their relative merits. If I were confined to one Apple only for my own consumption I should choose Cox's Orange Pippin, but to keep up a succession of Apples over a long season I have found those to be enumerated well adapted for the purpose.

DESSERT APPLES.

For earliest dessert purposes I prefer the following:—Beauty of Bath, very early, handsome, a free grower, and good cropper;

brisk, juicy flavour. Irish Peach, very similar in quality; tree of rather peculiar habit, always fruiting on the extremity of shoots, therefore a careful system of pruning is necessary; ripens a few days later than Beauty of Bath. Mr. Gladstone, a good first early; colour very rich mahogany, crops well, and commands a ready sale; tree a compact and free grower, but rather deficient in flavour. Duchess of Oldenburg, not quite so early, but better in quality; beautifully striped fruit, full of sprightly juice and pleasantly perfumed. Those varieties do well as open bushes.

For second early dessert, Worcester Pearmain, one of the handsomest Apples in cultivation, excellent for market purposes, but deficient in flavour, and, like all the early section, should be used immediately after gathering; tree a good bearer and of shapely habit, fruiting freely as a bush or orchard standard. Lady Sudeley, new, or little known, but excellent; beautifully striped, and of very pleasant and agreeable flavour; crops well as a bush. Gravenstein, a splendid yellow-fleshed Apple, rich, sweet, juicy, a real favourite when in its best condition, rather a shy cropper, best on the Paradise stock, unless frequently lifted. American Mother, first-rate as a second early, good in flavour and cropping, producing medium-sized, handsome fruit, and the tree has a robust constitution.

For midseason dessert we have dozens of good varieties, but my choice commences with Cox's Orange Pippin, the best of all; rich yellow flesh, having much of its parent's flavour, the old Ribston; makes a handsome, shapely bush or pyramid; rather spindly wood, and somewhat subject to slight attacks of mildew, a good bearer on any stock, having plenty of fibrous roots. Blenheim Orange, hard to beat all round, but does not bear well as a bush nor on young trees, makes a superb standard orchard tree on the Crab stock; probably this was the greatest prize ever raised from a chance seedling, the quality is familiar to all. King of the Pippins, an old but unbeaten variety, very handsome; a good bearer, and keeps in good condition over a long season. Claygate Pearmain, excellent, and ought to be grown more extensively; much the appearance of Cox's Orange; tree rather more vigorous, and fruit a little more conical and russety; crops freely, and keeps well.

For latest dessert.—May Queen, highly recommended, very handsomely coloured, medium size; an extra good cropper, tree of free growth and splendid habit. We have model bush trees of this variety which never fail to give us branch cordons of grand fruit; in fact, thinning has to be done every year. Court Pendu Plat, the latest to flower, hence its popular name—the Wise Apple—may be relied upon to crop well. The fruit keeps well, and is of handsome appearance, singularly flat and distinct, flavour brisk and good. Sturmer Pippin, a hard fleshed Apple and long keeper, dull red cheek on green ground, juicy and good when others have vanished. It makes a good standard tree for an orchard. Lord Burghley and Allen's Everlasting are both of rich Pine flavour, and may be kept in sound condition until June, succeeding as bushes or standards in orchards in Worcestershire.

Good late keeping dessert Apples are always scarce, consequently of the greatest importance. Our friends at the antipodes command our markets with them, their samples being often retailed at 3d. to 6d. each; but the best flavoured varieties we receive are Calville Blanche as grown in France, and Newtown Pippins as grown in Canada and the United States. Apples may be kept longer in season if stored in barrels away from the air, but the flavour is not improved thereby.

Sixteen dessert sorts may possibly seem a large number for the ordinary fruit grower, but it is rarely that all those named succeed on any one place. Therefore, to ensure success a trial must first be made; then those that answer the best may be planted in quantity, according to circumstances, for doubtless all of us already know something of the subtle influences of soil and climate, as well as the evil of planting too many sorts. The same remarks also apply to the following sixteen culinary kinds:—

CULINARY APPLES.

For very earliest gathering: I can recommend Old Hawthornden, Manks Codlin, Lord Suffield, and Ecklinville Seedling, all pale-coloured. The trees are good growers, and enormous and certain croppers when grown as bushes.

Second early: Peasgood's Nonesuch is the largest and handsomest fruit we grow, consequently returns the best prices in the market. The tree makes an excellent orchard standard, and is a free grower of shapely habit, but a rather shy bearer. Stirling Castle, Cox's Pomona, and Potts' Seedling are each good bearers, and succeed well as bush trees.

Midseason Varieties: These are best represented by Lane's Prince Albert, a splendid and handsome Apple, a most prolific bearer of the best quality; does best as a bush, the habit of the tree being somewhat irregular as a standard. Bismarck, new, promising well, so is Bramley's Seedling, giving handsome fruit, which keeps

well, enhancing its value. Golden Noble is a bright yellow-skinned Apple of great beauty, even in outline, and having rich, clear white flesh when cooked. These last named three make fine orchard trees, worthy of general cultivation.

Very Late Keepers.—Dumelow's Seedling, otherwise Wellington, Normanton Wonder, &c. This makes a fine orchard tree, rather drooping in habit, having peculiar speckled wood; requires considerable pruning to prevent overcrowding; fruit medium size, very firm, yellow in colour, with a rosy cheek on the sunny side; flesh very white when cooked, but singularly acid; one of the very best sauce or jelly Apples. Flanders Pippin, an invaluable late Apple, chiefly so on account of its saccharine properties, suitable for dyspeptics who cannot enjoy Apples, requiring raw sugar to make them palatable. The tree is suitable for the orchard only, and does not bear until attaining a fair age. Newland Sack, a local kind, but possessing valuable properties as a long keeper; makes a splendid orchard standard tree that lives to a great age; bears regularly; fruit dull green and russetty; of medium size, but not striking in appearance; trees get very thick unless systematically pruned. For very latest use nothing beats the old Ironsides or French Crab, which may be kept sound for two years.

The above varieties do not by any means exhaust the list of good and desirable Apples, but they will be found sufficient for general requirements. The most common error is in planting too many sorts, but there is yet room for our raisers of new Apples to give us very late kinds of better quality.

Colour is a great desideratum for market purposes, although it never entirely represents flavour. At the same time I think there can be no question that fruit of any kind grown on trees, kept thin and open to the influences of sun, light, and air, must be better coloured and preferable to those grown in the shade of a thickly crowded tree. I have never yet seen an over-thinned tree where the roots were right. In my opinion the stock exercises a certain degree of influence in the production of colour in Apples. In addition to my own experience on Madresfield soils, aspects, climate, and other cultural details, I saw this practically demonstrated most clearly last September at Kempley, Gloucestershire, where samples of the finest and highest colour of Worcester Pearmain and Peasgood's Nonesuch I had ever seen were grown and shown by an intelligent amateur in that village. These grand fruits had been grown under ordinary circumstances on trees supplied from our home nursery, worked on our favourite Crab stocks, and raised from pips of high-coloured cider Apples. Such evidence was extremely pleasing and encouraging, as foreshadowing what we may expect when the thousands of trees we are planting come into full bearing.

I do not deny but that good fruit can and is produced on Paradise or other dwarfing stocks; but personally I see no necessity for an alien stock when the indigenous Crab gives us all we require under proper management.

METHODS OF CULTURE.

We have yet to deal with the important question, How best to grow Apples? So, following the familiar precedent on hare-cooking by first catching the hare, we will first deal with the tree. My favourite shape of tree is that commonly called the open or pyramidal bush, having branches furnished with fruiting spurs from stem to extremity, regularly situated branches at not less distance than 2 feet apart, and trees planted at least 9 feet asunder.

It may well be asked here, What is the fundamental part of a tree? The roots. What part of a tree is most out of sight—yes, and mind too, and consequently receives least attention? The roots. What part produces or fails to produce the success or disappointment the cultivator is entitled to? The roots. Now, being of such importance, what are roots and what their functions? Roots are of two kinds—the deep or tap roots, and the surface or fibrous roots; in short explanation, the former produce wood and the latter fruit. The natural tendency of the Crab stock is to strike down deeply at first, making tap roots, and the aim of the skilful cultivator should be to convert these tap roots into fruitful fibrous ones by early careful digging up, and replanting them in a horizontal position near the surface, instead of the perpendicular, as in nature. Such an operation dispenses with what is called root-pruning, on the same principle as "Prevention being better than cure."

Why allow trees to make deep tap roots and the certainty of unfruitful wood, both of which have to be cut away with the knife, saw, and spade? The worst part of it is that when a tree has been going on for some time unchecked in this manner and root-lifting is attempted the tap roots are found to be too strong and stubborn to be brought up near the surface, consequently they have to be cut off, which frequently throws the tree into a state of chronic debility, and from which it seldom recovers. It may be taken as an axiom that an abundance of fibrous roots always

complete the ripening of the wood and fruit buds made, but wood made by tap roots never ripens; moreover, so few fruit buds are formed whilst the tree is exhausting its energies to grow gross wood. It will, therefore, be plain to see the importance in purchasing trees to select only those which have had several removals, consequently plenty of fibrous roots. Once the balance is struck and the fibrous roots are formed there is little fear of unfruitful or tap roots again forming; moreover, pruning will be reduced to a minimum, and thinning of the fruit will take its place, although possibly a more painful operation to properly accomplish. I have an idea that nine out of every ten growers are actually afraid or too timid to take these advantageous liberties with the roots of trees; but let anyone try the experiment to test this by carefully lifting a small tree and as carefully replanting at once, treading the ground solid. The work should be done in November, and a mulching placed on the surface. In the case of orchard standards the position is reversed, because a tree presenting an increased surface to the wind will need a few deep roots as a kind of sheet anchor, which is one of the reasons of their being longer in coming into bearing.

For small areas the cordon system is recommended, and doubtless the finest fruit may be obtained in this way, especially when trained against buildings, walls, fences, wire trellises, or over walks, to form a kind of ornamental and useful avenue. Espaliers seem to have lost caste of late years, as much better results are obtained from the same space by planting rows of single cordons trained diagonally.

The substance which I have intended to convey is to plant numbers of Apple trees, but of few kinds, selecting those with short firm wood and fruit spurs and abundance of fine fibrous roots on prepared Crab stocks principally. Plant shallow on firm ground, mulch heavily, instead of mixing manure in the soil; give water and stimulants according to weather and crop. Keep the trees thin, and aim at quality before quantity. Apple growing will then become both a pleasure and a profit.

LARGE APPLES.

I SEND specimens of Peasgood's Nonesuch Apples. I have a dozen bush trees of the variety on the Paradise stock. They were planted in the open fruit garden with other kinds in February, 1890, being then small trees. They were cut back when planted; but beyond cutting out any cross shoots, and stopping the points of strong growths about the last week in June, they have had little done in the way of pruning. Soil, a strong, clayey loam, with a clay subsoil under-drained. The site had been used for a vegetable garden, and being in good condition no manure has been needed yet.

There were a little over 3 bushels of various sized Apples on eight of the trees only, the smallest being the size of a good Blenheim Orange which they very much resemble. Position south, sheltered on the south-west by a wood. The trees are now 6 to 7 feet high, growing strongly and forming fruit buds freely, and will, I think, give some good fruit next year if the spring is favourable.

Most fruit trees here are grown on the extension principle, and if any grow too strong the spade is run round their roots. There are a number of trees on the free stock, and the dwarfs are planted between to give a quick return, and from the heavy crops some of them give they cannot last many years. Such sorts as Stirling Castle, Ecklinville, the Saltmarsh Queen, Lane's Prince Albert, Duchess of Oldenburg, Domino, and Small's Admirable are like ropes of Onions. Whilst some varieties do well others scale and canker, then out they go and are replaced with others that are found more suitable.

Most of the Peasgood's weigh from 1 lb. upwards. They have not been thinned out, or had any water or stimulants of any kind, or no doubt they would have been much larger. —W. SALCOMBE, *Gardener to the Dr. Newington, Ticehurst.*

[One of the Apples sent is the largest we have seen grown in the open air. It was 16½ inches in circumference, and weighed, when gathered, 26 ozs. We congratulate Mr. Salcombe on his notable cultural achievement.]

EDUCATION IN GARDENING.

SILVER MEDAL ESSAY. (Continued from page 499).

METHODS TO PURSUE.

ALL study requires method, perseverance, and determination. There is little to be gained from continually jumping from one thing to another. Whatever subject is studied it ought to be followed up steadily and persistently, for a time at least; then

if a change would seem beneficial, follow up another in a similar manner for a corresponding period.

The best methods of acquiring correct orthography are to study the rules of spelling, adopt careful reading and writing, never being satisfied that a word is spelt right unless absolutely sure. This can be done by consulting a dictionary, carefully correcting all errors. By following up these methods improvements will soon be effected, and after a time the student will be able to see almost at a glance when a mis-spelt word occurs.

Grammar is to composition what spelling is to words. It determines the place of words in sentences, so that the sense conveyed may be expressed clearly. Become thoroughly acquainted with all the parts of speech, which will form the best of all foundations for clear expression. Further progress in this subject, as it can be carried on, will be found to be beneficial. The aim should be to obtain as much knowledge as is compatible with proceeding steadily on with other important and necessary subjects as well.

Botany, being a subject of such paramount importance, it is necessary that a large proportion of attention be given to it, selecting the most useful and practical parts of the subject for the earliest study. This will consist chiefly of morphological botany, or description and study of the organs of plants. Study first the general character of plants, choosing one of the two great divisions into which plants are divided—namely, flowering plants; the other division, which may also be studied, but later on, being that of the non-flowering section. Follow this by learning all about the tissues of plants, their nature and growth; the food of plants; the early development from seed; the growth of roots, stems, and leaves. Particular attention must be paid to grasping all that can be learned about the foliage of plants, as knowledge upon that point is needed in horticulture in order to avoid some of the most prominent cultural mistakes. Leaves are the lungs of plants, and when the distinctively important part they play in the life history of all plants is fully conveyed to the mind, a great lesson in horticulture is embodied in the teaching, which never fails to impress itself upon the whole knowledge previously or afterwards gained. Next comes the flower and its parts, a most absorbing study; the manner of inflorescence, or the general character of flowering as displayed by a variety of plants, as well as the great range of form in which the fruit and seed are produced. The classification of plants, their division into families, genera, species, and varieties, together with their proper names, constitute the nature of the information it is desirable to impress on the mind.

The best and most interesting method to pursue to gain this knowledge is for several students to amalgamate together in a class, which ought to be led by a qualified instructor. Where a class is out of the question, perhaps a few kindred spirits might be brought together for mutual help. Two or three earnest, intelligent students could thus encourage and stimulate one another, discuss knotty points, bringing their combined insight to bear on one problem and thus fathom the mystery. Combination of effort is at all times desirable, but in many cases not always possible; therefore the solitary student unable to command the help of another must perforce pursue the study alone. Even in this case effort and perseverance will command success, and where the help of companions fail that of books may take their place, and an unflinching help, too, they will prove to be if constantly studied. Probably no better methods of pursuing the study of botany, geology, geometry, chemistry, or other science can be indicated than recommending the systematic study regularly of some of the standard volumes on the subjects, taking first an elementary course of lessons, then following with the advanced. It is always better to study in company with another if possible, and better still in an organised class. A similar course conjoined with as much practice as possible is recommended in pursuing the subjects relating more particularly to practical gardening. Endeavour to ascertain the reason of each separate step, considering nothing too simple or unworthy of critical analysis, because it is only by thoroughly understanding each step that progress is made firmly, and the more difficult advanced lessons rendered easier of comprehension.

Study carefully, regularly, and diligently current horticultural literature, and endeavour in every particular to keep abreast of the times. Theoretical knowledge is valuable, but comparatively useless unless accompanied in many cases by practice. Every student in horticulture ought, therefore, to seek early in life employment in practical gardening, and embrace every opportunity of comparing the knowledge gained in actual experience with that acquired by study. Then the one will help the other. No young man ought to be above taking an humble position in any department of practical work if by so doing he can increase his knowledge and skill. Endeavour to secure experience in widely different localities. With youth, freedom, and good health on his side an ambitious young man who aspires to a wide knowledge of his

profession cannot do better than seek several changes during his probationary period, but they should be sought with only one end in view—improvement.

Keeping a diary, or making notes of all important work, is one method of not only gaining knowledge but of storing it up for future use; besides, the practice is beneficial in more ways than these. Render the record interesting by describing the methods of any valuable practice that has been done or seen done. It is possible in many districts to have the privilege of becoming a member of an horticultural society which meets periodically for the purpose of mutual improvement of the members. Much information may be gained in this way. Listening to papers or essays, sometimes popular scientific discourses, and taking part in discussions, is an interesting way of receiving and imparting knowledge. Nearly all societies are well supported by intelligent amateurs, from whom many improving and valuable hints are often derived. Modern improvements in diffusing information have given the means of obtaining valuable horticultural knowledge on practical subjects by the establishment of illustrated lectures, which convey in a clear and popular manner a great amount of information. Where such lectures are given every gardener and student in horticulture should make it a point of attending.

Reading, apart from close study of a subject, is essentially helpful by preparing the mind for the reception of some of the chief facts and principles. Reading is the means of embracing a subject temporarily, passing in review the leading points which call for closer study. By endeavouring to do this systematically and steadily much benefit may be gained, even from one perusal of a book; but by following on a second or a third time still further satisfactory results can be attained.

Observation is capable of throwing much light on whatever is studied or read about. Without the practice of closely observing little progress can be expected to be made. Science has been built up by persistent observation, in which the causes of things have been traced. By education this power of tracing cause and effect is strengthened. A skilful gardener who thoroughly understands the process of watering plants, in pots especially, has gained his power of doing so by accurate observation. He can, as it were, see through a ball of soil and judge its condition correctly through the knowledge gained from prior observations. It is much the same with many other processes, though some, of course, require manipulative skill from frequent practice.—E. D. SMITH.

(To be continued.)

FUNCTIONS OF VINE LEAVES.

THE discussion of this subject in the *Journal of Horticulture* has certainly been an interesting one, and, I hope, instructive. Both sides have defended their systems of culture very well, and I do not doubt that both methods would result satisfactorily. Some years ago I advocated a free, even a bountiful, growth of foliage, and, if I am not mistaken, Mr. Iggulden then took the opposite view, and said that I was extracting material from the border to build up wood that would only be cut away and burnt. That is true to a very large extent; but looking at the matter from an all-round point of view, it cannot be considered waste, because, if we attain the object we have in view by an extension of foliage, we can soon replenish the plant food that has been extracted from the border. I could point, if I wished, to splendid examples of Grapes that were grown for many years by allowing the Vines to make a luxuriant growth of foliage, almost resembling a thicket.

I have modified my opinion very much in this respect, and think that common sense is needed more in this matter than adhering to any hard and fast rule. A liberal growth of foliage is the salvation of a house of Vines which have been partially or wholly lifted. It also has a re-invigorating effect on Vines that have been overcropped, or have sluggish root-action. Enfeebled Vines would much more rapidly be restored to a healthy condition by a free growth of foliage than could possibly be done by any system of close stopping.

We do not, as a rule, take bunches from every lateral on the Vine, and if I understand Mr. Iggulden rightly he does not pinch those from which he takes no bunches so closely. These are alone ample on healthy established Vines to furnish the roof space with foliage fully exposed to the light and to maintain the roots in activity. I am also inclined to believe that this amount of leaf development is ample to keep healthy Vines in a satisfactory condition, provided the foliage is kept clean and the Vines judiciously fed and cropped.

I think it immaterial whether the laterals are stopped at the bunch or one or two joints beyond. I am never very particular about this matter. If the bunch shows close to the main stem I often allow two or three leaves to run, if produced a good distance

from the main rod it may be stopped at the bunch or at one leaf. Whether stopped at the bunch or whether one or two leaves beyond I have never noticed any perceptible difference in the Grapes. If I could determine which bunches I should retain at the time the laterals were first stopped I would certainly pinch them at the bunch and not allow any sub-laterals to extend beyond the bunches. At the time of writing I have Grapes hanging in this condition now, and they are slightly larger in the berry; there is no difference in the colour because all are black. I was first led to adopt this system of stopping by noting a large bunch close to the main rod from which the shoot beyond was accidentally broken when tying down. The lateral had only three leaves on it, and the Grapes were as perfect as any in the house. I am inclined to think by stopping at the bunch the Grapes set better and receive the support that otherwise pass to the leaves beyond.

I do not put particular faith in large wood and heavy leaves. They might be the result of over-luxuriant Vines that sooner or later collapse under the strain of fruit-bearing. I have seen bold foliage that would have been the admiration of Grape growers if the crop had been removed before they saw them. Very often Vines that "shank" by getting their roots in cold or unsuitable soil often produce large foliage, but I have not yet been curious enough to weigh them. What I like to see, and have, is wood that is firm and hard when cut, practically pithless, even if the foliage is moderate in size; such wood will, all other things being right, usually produce good well finished Grapes.

I am not an advocate for large bunches; they are sensational in their way, and may do for particular occasions and exhibiting. Many of us have families to provide for, and I find a few large bunches useful, but the majority of moderate size are far more serviceable.

I am not half so afraid as I used to be years ago of exhausting Vine borders. There is often far more digging out and replenishing than there is any occasion for. Very frequently they are poisoned by overfeeding, not exhausted, but I hope before long to have more to say on this matter.—WM. BARDNEY.

ADIANTUM FARLEYENSE.

HAVING read with much interest the cultural details given by "J. C. C.," and by Mr. Charles Payne (page 478), as the best means of growing this beautiful Adiantum, perhaps I may be allowed to add my experience in the culture of this Fern. I had a few plants in 7-inch pots, and in the early spring these were shifted into 12-inch pots. The compost used comprised equal portions of loam and peat with the fine shaken out, retaining only the fibrous parts; to this were added some sharp sand and well-burnt cinders crushed to about the size of hazel nuts, care being taken to select only those which contained no gas. The whole is thoroughly mixed and well worked round the plant with the rammer. This compost is what the plants had until they were given the final shift, when a few pieces of charcoal and crushed oyster-shells were put over the drainage. When the plants became root-bound weak liquid manure was given once a week during the summer months.

They were grown in the fernery, which was shaded through the summer months, a humid atmosphere being always maintained. I do not believe in syringing the plants, as it causes a rusty and glazed appearance on the pinnæ, and, in my opinion, helps to bring scale. The fronds should be supported and brought into position with fine sticks, and all old and decayed foliage picked out. I may mention the largest plants grown as described measured 5 feet and 5 feet 6 inches in diameter. Should the plants in course of time be getting weaker (as they generally do), they ought to be cut into parts, as many as required, say four or five. This is best done in the autumn; they can then be readily divided in the spring, and so save a check caused by bleeding.—H. P., *The Knoll Gardens, Wimborne.*

MR. C. RUSSELL, on page 456 of the *Journal of Horticulture*, when describing his treatment and success in growing this Fern, asks for the experience of others who may have been successful. Many do not succeed in growing this Fern to their satisfaction. I have for the last twelve years been most successful with the culture of *A. farleyense*, and have grown it in hanging baskets, also in pots, from 3 to 16 inches in diameter. My advice to those who wish to succeed in growing this Fern is to pot it in a mixture of turfy loam, old mortar (broken), charcoal, and coarse sand, with a shovelful of burnt ashes instead of leaf soil. Clean pots should be used, with plenty of drainage, and the soil be rammed firm. Water with care until growth has well commenced. I find a temperature of from 60° to 65° quite sufficient. This Fern should never be syringed from the end of August to April. It likes, however, a moist bottom. Standing the pots on a block in the middle or round the edge of a tank is a good practice. The fronds should be staked or suspended on a ring of wire, held in position by sticks placed at intervals round the edge of the pots.

With respect to keeping *A. farleyense* dry in winter, I do not keep it drier in winter than at any other time, but apply water when required, using diluted manure and soot water at intervals during the winter months. At one time I used to grow it largely in 5-inch pots for table

decoration, as my employers were particularly fond of it for a change. We generally used to place six 5-inch pots at equal distances on a round table and a large plant on a raised stand in the middle. The effect was charming, although rather heavy.—JOHN CHINNEY.

EVENTS OF THE WEEK.—The ensuing week will be comparatively quiet one in horticultural circles. As announced in our last issue the general meeting of the Gardeners' Royal Benevolent Institution will be held on Tuesday, December 20th, at Simpsons', 101, Strand. The customary auction sales will also take place, for particulars of which see advertisement.

— THE WEATHER IN LONDON.—The weather in the metropolis continues to be variable. Sunday opened fine and rather mild, with a slight fall of rain in the evening. Frost was apparent on Monday morning and again on Tuesday, freezing hard at night. A change to rain occurred, however, early on Wednesday morning, and at the time of going to press it is fine but cloudy.

— WEATHER IN THE NORTH.—The week beginning the 6th inst. has been marked by less intense frost than the preceding; 14° were registered on the 6th, and 15° on the 8th. On the latter evening and during the night snow fell heavily. A thaw set in on the 10th, and continued for two days; but frost (7°) has again recurred, rendering the roads almost impassable with ice.—B. D., *S. Perthshire.*

— GARDENING APPOINTMENTS.—We learn that Mr. Herbert R. Richards, recently foreman in the glass department Longford Castle Gardens, Salisbury, as head gardener to Major Trafford, Bawns, Roche Court, West Dean, near Salisbury. Mr. J. Gibson Fielden, late foreman at The Gardens, Dalton Hall, Hull, has also been appointed head gardener to S. Hubbard, Esq., Ilkley Wells House, Ilkley, Yorkshire.

— ROYAL HORTICULTURAL SOCIETY'S MEETINGS IN 1893.—The meetings of this Society for the ensuing year will be held as follows:—January 14th; February 14th; March 14th and 28th; April 11th and 25th; May 9th, 25th and 26th (Temple Show); June 6th and 20th; July 11th (Chiswick Show), and 25th; August 8th, 29th, 30th, 31st, and September 1st (Agricultural Hall Show); September 12th and 26th; October 10th and 24th; November 14th, 28th, and December 12th.

— BLUE TITMICE AND FRUIT BUDS.—Regarding the article on the above heading on page 459 of the "Journal," let me say blue titmice receive but little sympathy in Clydeside. I, for one, suffered by them last year, having a border of young Gooseberry bushes well-nigh stripped of their buds; and as for them attacking bees, I remember twenty years ago having seen them do considerable damage to a hive of bees by killing great numbers at the mouth of the hive. They were in turn caught themselves, and summarily dealt with.—J. W.

— A LUCKY SHOWMAN.—The Editor's remarks on page 512 respecting "A Lucky Showman," places the subject in its proper light. A great many of our best gardeners lay the foundation of a place, when by some unforeseen circumstance they have to leave their situation. Other men then enter, take charge, and commence at once to reap the benefit from the previous man's labour and skill. Such instances are, I think, best not referred to in the public papers, as every gardener ought to understand that he cannot help such things occurring. Good men's work live after they have left the place, and is seen by results.—JOHN CHINNEY.

— ROYAL METEOROLOGICAL SOCIETY.—At the ordinary meeting of the Society, to be held at 25, Great George Street, Westminster, on Wednesday, the 21st inst., at 7 P.M., the following papers will be read:—"Moving Anticyclones in the Southern Hemisphere," by H. C. Russell, B.A., F.R.S., F.R.Met.Soc. "The Tracks of Ocean Wind Systems in Transit over Australasia," by Captain M. W. C. Hepworth, F.R.Met. Soc. "A New Instrument for Cloud Measurements," by Dr. Nils Ekholm, Hon. Mem. R.Met.Soc. "Rainfall of Nottinghamshire, 1861-90," by Henry Mellish, F.R.Met.Soc.

— GARDENERS' ORPHAN FUND.—It has been resolved that an election for eight children to be placed on this Fund shall take place at the annual meeting in February.

— DEATH OF MR. H. T. STANTON.—We regret to record the death of this eminent entomologist, which took place recently. Mr. Stanton was in his seventieth year, and for a long period he acted as Secretary to the Linnæan Society. He was well known among scientific men.

— A BOUQUET FOR MRS. GLADSTONE.—We are informed that during the Premier's visit to Liverpool recently to receive the freedom of the city, Mrs. Gladstone was pleased to accept a very handsome bouquet of choice Orchids, presented by a daughter of Mr. John Cowan on behalf of the Liverpool Horticultural Co.

— NATIONAL FOOTPATH PRESERVATION SOCIETY.—This Society continues to do good. According to the annual statement just issued the cases of footpath interference and encroachments dealt with from October 1st, 1891, to September 30th of this year were 157. Since its foundation eight years ago the Society has dealt with 880 cases.

— OUTDOOR ROSES IN DECEMBER.—A correspondent writes:—"I notice that people in various parts of the country are writing to the papers, stating that they have Roses growing in their gardens at the present time. It may interest your readers to know that on Saturday, December 3rd, I saw Roses in full bloom on the walls of several houses in villages on the foot of the Yorkshire wolds."

— JASMINUM NUDIFLORUM AND COTONEASTER MICROPHYLLA.—What a delightful contrast is made by the bright yellow of the winter Jasmine and the pleasing red of the Cotoneaster berries, enhanced also by the dark green leaves of the latter. I have these two shrubs so growing together that it makes one wish to see more similar examples. I never saw the Jasmine flowering more freely than now.—M. S.

— ANOTHER YELLOW-FLOWERED CALLA.—Yellow-flowered Callas will soon be as common as the white forms. I am informed that Mons. J. B. A. Deleuill, a well-known nurseryman of Marseilles, has a splendid yellow Calla of his own raising. The new hybrid is said to be a cross between *C. hastata* and *C. albo-maculata*, and is of dwarf habit with chrome-yellow spathes. The foliage is spotted, like one of its parents. It will be known as *Richardia aurata*.—H.

— NATIONAL AMATEUR GARDENERS' ASSOCIATION.—The members of this Association held their second annual dinner at the Holborn Restaurant on Tuesday, December 13th. Mr. T. W. Sanders, the President, occupied the chair, and there were upwards of 100 ladies and gentlemen present. Alluding to the Association, the Chairman said, although started but two years ago, unprecedented progress had been made, there being 408 members on the books. There were also one branch of the Association at Liverpool and several affiliated societies, including one in Tasmania. The medals and certificates won during the year were distributed, and with the aid of a capital musical entertainment a most enjoyable evening was spent.

— BERRY-BEARING SHRUBS.—The note by "T. A." (page 510) referring to berry-bearing shrubs calls to my mind a beautiful sight that I saw in Kent in the autumn. This was on the road leading from Eynsford railway station to Messrs. H. Cannell & Sons' seed farm. The hedges were literally aglow with berries of many kinds and shades, from a bright crimson to a dark purple, forming a sight better imagined than described. The soil appeared to be dry, light, and rather chalky, which to a certain extent may account for the profusion of the berries and the luxuriance of the wild Clematis, that made an additional charm to the lovely scene. Perhaps Messrs. Cannell can tell us something about these wild berry-bearing shrubs.—C.

— THE WAKEFIELD PAXTON SOCIETY.—At the recent meeting of this Society Mr. Pitts, gardener to Dr. Kendall (Walton), read a practical paper on "Winter Digging and Manuring." In the course of his remarks, Mr. Pitts strongly recommended the carrying out of all digging and trenching operations before the close of the year, in order that the soil might be well aerated and broken down by the frosts. He enumerated most of the leading manures used in farming and gardening operations, explaining the results of their application upon the various crops; but, after all, he pinned his faith upon ordinary farmyard manure. In the course of a long and interesting discussion which ensued, some exception was taken to the lecturer's dogmatism in the latter respect. Mr. Pitts, in reply, maintained his position, and showed he had good grounds for his faith in farmyard manure.

— APPLES IN ONTARIO.—It is estimated that Ontario, Canada, had an Apple crop this year, including the autumn and winter varieties, of 3,384,179 barrels.

— BAUHINIA GRANDIFLORA.—According to the *Revue Horticole* this plant has flowered for the last few years in the open air at the Botanic Gardens, Lisbon. It is a magnificent stove plant, and is not so generally grown in this country as it might be.

— DEATH OF DR. HAWKSLEY.—Mr. Thomas Hawksley, M.D., founder of the National School of Handicrafts for Destitute Boys at Chertsey, at a cost of £30,000, and formerly in extensive practice in London, died at Chertsey on December 13th, at the age of seventy.

— BALDWIN APPLES.—It is stated that the original Baldwin Apple tree was discovered in Wilmington, Mass., in 1784. In 1835 it was recorded that William Winn of Woburn sold 400 barrels of Baldwin Apples to a dealer in Faneuil Hall Market, Boston, which was said to be the largest crop raised by any person at that time. It is at the present time one of the most popular foreign Apples sold in our markets.

— CROCI.—I am glad to see that Mr. Arnott is keeping up the Croci, and shall be pleased to send him a batch of *Ochroleucus* when lifting time comes. I flowered the first bulb of *Scharojani* seen in England from an odd bulb amongst some others sent me by our poor invalid friend Maw. I sent him the bulb, but never got the sort again. It flowered in July.—R. T. CLARKE.

— NARCISSI IN THE SCILLY ISLANDS.—It is said that in the Islands of Scilly it is not a rare sight to see hundreds of thousands of beautiful Narcissi in bloom in the field in February and March months, and the Narcissi crop now takes precedence of the Potato. Many who grew Potatoes largely a few years ago now grow none at all. One grower, Mr. Francis Watts, will have under cultivation this season twenty acres of Narcissi alone, comprising over 100 varieties.

— ARTIFICIALLY COLOURED FLOWERS.—An American contemporary regrets, and rightly, that artificially coloured flowers are again becoming fashionable in New York. Not many months ago green Carnations were popular in London, but in due course the public taste changed and the artificially coloured blooms gave place to those of a natural shade. The fashion, however, has re-appeared in trans-Atlantic circles, and we are told that bluish-green Chrysanthemums have been prevalent in the capital of the United States this autumn. They are described as looking "like paper flowers manufactured by some artisan with uncommonly bad taste."

— GLASS BRICKS FOR GREENHOUSES.—A new feature in the construction of greenhouses has recently appeared in Europe, says the "Garden and Forest." Mr. Falconnier, an architect at Nyon, Switzerland, has invented a hollow brick, which is made of glass. These bricks are not only capable of being used in greenhouse construction, but there already exists a house in the park Tête d'Or, at Lyons, France, in which such bricks have been used in connection with iron for the arches of the framework. The bricks are used as ordinary bricks would be, and are fastened together either with lime, cement, or plaster. They are translucent, and are blown in the same manner as glass bottles are, in order to make them hollow. They are 20 centimetres long, 14 centimetres wide, and 115 millimetres thick (say 8 inches long, 5.5 inches wide, and 4.5 inches thick), and sell for 24 francs a hundred; this price, however, could be much reduced in case of a growing demand for them.

— LIVERPOOL HORTICULTURAL ASSOCIATION.—The sixth annual dinner in connection with the above Association, held at the Grand Hotel, Lime Street, on Saturday evening, was a distinct success, the attendance numbering about 130. W. Fletcher Rogers, Esq., the Hon. Treasurer, presided, and he was supported by Mr. Thomas White, Chairman of the Association, and Mr. R. W. Ker. After the usual loyal and patriotic toasts had been proposed, Mr. R. W. Ker gave that of the Liverpool Horticultural Association, and spoke of several who had passed away since the last annual gathering, and also paid a tribute to the memory of the late Mr. John Downie of Edinburgh. He went on to speak of the class of plants which used to be exhibited in bygone years and those of the present day, and urged gardeners not to forget some of their older friends, which had had to give way to the prevailing fashion of the day, which might only be of a fleeting character. Mr. T. White briefly followed, stating that this year was the best both as regarded finance and quality of exhibits that the Society had ever had.—R. P. R.

— **HORTICULTURE IN FRANCE.**—The ninth Congress, organised by the National Horticultural Society of France, will be held at Paris concurrently with the General Horticultural Exhibition in the month of May, 1893. The sittings of the Congress will be in the rooms of the Society at two o'clock P.M.

— **THE "KEW BULLETIN."**—This monthly publication appears to increase in interest and usefulness. The December issue contains valuable articles on the "Disappearance of Desert Plants in Egypt," "Taj Gardens, Agra," "Indian Gutta-Percha," "Gold Coast Botanical Station," "Ramie Machine Trials at New Orleans," "Earl of Bute's Botanical Tables," and half a dozen pages of "Miscellaneous Notes." The four which follow are samples. We may state that on and after 1st January next the price of the *Bulletin* will be 4d. per copy.

— **KEW APPOINTMENTS.**—Mr. John Masters Hillier, lately an attendant in the Museums of Economic Botany, has been appointed, on the results of an examination before the Civil Service Commissioners, an assistant in the Royal Gardens to date from September 6th last. Mr. William Watson, lately senior foreman and acting Assistant Curator of the Royal Gardens, has been granted a certificate by the Civil Service Commissioners as Assistant Curator under clause vii. of the Order in Council of 4th June, 1870.

— **UNDER the title of "HARDY SPECIES OF EUCALYPTUS"** mention was lately made in the *Kew Bulletin* (1889, page 61) of seeds of *Eucalyptus globulus*, received from Mr. Abbott, of the Botanic Gardens, Tasmania, and collected from trees growing at high altitudes and accustomed to be exposed to severe frosts. It was hoped that plants raised from these seeds would be likely to bear with impunity the rigours of an English winter. The seeds germinated very freely at Kew, and when the plants were strong enough they were put out in a sheltered bay in the Arboretum nursery in the middle of the summer, in order that they might become established before the approach of the winter. The result of the experiment in this particular instance was disappointing. The first hard frosts in 1889 so severely injured them that, notwithstanding the protection they afterwards received from a canvas screen, they all succumbed before the winter was over. At Kew these seedlings from Blue Gum Trees, accustomed to severe frosts in Tasmania, were, if anything, not so hardy as those of the ordinary forms of *Eucalyptus globulus*. A similar result has to be recorded with plants raised from seeds of *Eucalyptus coccifera*, received at the same time from Tasmania "from trees which were coated with icicles a foot long."

— **BERMUDA LILIES.**—It is pleasurable to record that the services rendered by Kew to the Colonies is recognised by private persons as well as through official channels. It will be remembered that in 1887 an exhaustive inquiry was made under the auspices of Kew into the Onion disease at Bermuda (*Kew Bulletin*, October, 1887). The cultivation of Onions is one of the principal industries of the colony, and the threatened destruction of the Onion crop was regarded by the people as a matter of grave concern. The inquiry made by Mr. Arthur Shipley, F.L.S., established the fact that the disease was caused by a parasitic fungus (*Peronospora schleideniana*) allied to the well known Potato blight. The remedial measures suggested by Mr. Shipley were practical, and it is hoped the disease is now well within the control of the cultivators. Besides Onions, Bermuda is also noted for the cultivation of Lilies (*Lilium longiflorum*, var. *Harrisi*), and from Mr. W. T. James, one of the largest growers of these beautiful plants, Kew has received in recognition of its services, a yearly present of bulbs for the decoration of its conservatories. These plants have proved of striking interest to visitors, and have been greatly admired.

— **ACANTHORHIZA ACULEATA, WENDL.**—The large specimen of this Palm in the Palm House, probably the largest in Europe, is now flowering for the first time. It has a stem 26 feet high, 23 inches in circumference near the base, which is clothed to a height of a foot above the ground with the curious spinous roots peculiar to the genus. The head is about 10 feet high, and is composed of about fifty leaves, which are orbicular palmate, 5 feet in diameter, dark green above, silvery below, split nearly to the base into about sixty segments. The petioles are 3 feet long, unarmed, the margins clothed with white thread-like fibres 9 inches or more long. The inflorescence is a branched drooping dense panicle of white flowers, which are hermaphrodite. A figure of the plant has been prepared for the *Botanical Magazine*. The species is a native of Central America. It has also been called *Chamærops stauracantha* and *Thrinax aculeata*. The other species of this genus—viz., *Acanthorhiza arborea*—is also in cultivation at Kew.

— **BLUE TIT AND FRUIT BUDS.**—While pruning Gooseberries a short time ago I observed a couple of blue tits working very eagerly on the bushes I had pruned. They had found out that they could more easily get at the scale on the main branches after pruning. There is no doubt they are one of our best friends in this respect. Though a bee-keeper in a small way I have not seen them killing bees nor eating flower buds.—R. I.

— **MILD WEATHER IN DEVONSHIRE.**—As an evidence of the mildness of the climate at Teignmouth, a correspondent writes:—"I could send you a boxful of flowers from my garden—Roses, Dahlias, Fuchsias, and many others; and I expect other people could do the same. To-day, December 3rd, the air is warm and balmy like a May day. Invalids could not easily find a more suitable place to winter in than this pretty watering place."

— **INSECT-EATING BIRDS.**—It is claimed that any of the insect-feeding birds will catch about 200 insects a day, and a pair of old birds with a nest of five young ones require about 700 insects per day. This gives an idea of what they are worth in an orchard or garden. I wonder whether this includes the titmice, about which we have heard so much in the *Journal of Horticulture* recently. If so, surely they are worth protecting.—C.

— **EDUCATION IN GARDENING IN BELGIUM.**—The Belgians are advancing in the matter of providing a technical knowledge of horticulture. According to the *Illustration Horticole* there are two Government establishments in Belgium—one at Ghent, with an average of forty-four pupils, and one at Vilvorde, with an average of thirty-eight. In addition, the Government subsidises six other establishments, in which tuition and experiments are carried on—at Liège, Tournai, Mons, Carlsbourg, Virton, and Tirlemont.

— **THE CASTOR OIL PLANT.**—"Good Health" says:—"No sort of bird, beast, or creeping thing will touch a Castor Oil Plant. It seems to be a rank poison to all the animal world. Even a goat will starve before biting off a leaf, and a horse will sniff at it and turn up his upper lip as though it had been the most detestable odour on the face of the earth. There is hardly another instance in natural history of a plant being so universally detested by the animal world as the Castor Oil Plant."

— **POINSETTIAS.**—It may not be known, perhaps, to readers of the "Journal" that there are two distinct varieties of *Poinsettia pulcherrima*. I have been asked how it is that ours are so early, having produced bracts in November. It is this. One variety is much earlier than the other, and can be distinguished by the red midrib in the leaf, also by the colour of the bract, which is paler; the leaves are not serrated as in the ordinary variety. This is a most useful plant, coming into flower with the Chrysanthemums. The plants can be used with telling effect by dotting them amongst Chrysanthemums in the conservatory. Good bracts can be obtained from plants grown in 7-inch pots, and they do not grow so high as the variety that comes into use in December though struck at the same time. I find it will do with less heat than the ordinary variety, which, of course, makes it still more valuable. I advise those who have not grown it to do so, as it is so useful in the dull month of November.—T. P., *The Knoll Gardens, Wimborne*.

— **BRIGHTON AND HOVE HORTICULTURAL SOCIETY.**—The monthly meeting of the Brighton and Hove Horticultural Mutual Improvement Society was held on Thursday evening, December 8th. The subject for consideration was the cultivation and growth of Potatoes, of which vegetable some very fine specimens were displayed. Mr. A. Netley introduced the subject by reading a paper on "Potatoes and Their Cultivation." Having briefly introduced the history of the tuber since its introduction by Sir Walter Raleigh in 1586, to its present universal popularity, he spoke of the soil in which the Potato should be grown, and remarked upon the comparative freedom from disease and the greater cleanliness of skin of those grown in artificial manure. A great mistake made by many gardeners was the planting of their tubers too close together. The lecturer then gave a few hints as to the planting of the different varieties, and touched briefly on the parasites with which they were liable to be attacked, mentioning especially the "wireworm." He also alluded to the deadly growth of the fungus, which was so prejudicial to their healthy existence. The various specimens upon the table were then handed round, while the lecturer briefly gave the characteristics of each, mentioning in laudatory terms two varieties in particular—the Snowdrop, which he said was an excellent Potato for the Brighton soil; and the Beauty of Hebron, than which he did not think a better all-round variety could be found.

— **GUILD OF KEW GARDENERS**—The gardeners of Kew, past and present, are desirous of forming themselves into a Guild, and propose to publish annually a journal in which will be recorded—1, The present Kew staff, from the Director to the gardeners; 2, A list of all Old Kewites, with the date of their leaving Kew, and their positions and addresses; 3, Brief notices of distinguished Past Kewites; 4, Kew Notes; 5, Interesting Correspondence from Old Kewites; 6, The Proceedings of the Mutual Improvement Society and the prize essays of the year; 7, The Proceedings of the Kew British Botany Club; 8, The Report of the Cricket Club; Frontispiece—portrait of a distinguished Kewite. The journal will consist of about fifty pages, royal 8vo., to cover the cost of which, with postage, an annual subscription of 1s. will be necessary. It will be published on May 1st. Will all Old Kewites, *i.e.*, men who have at any time worked as gardeners at Kew, kindly send their names, date of leaving Kew, with present position and address, to the Secretary, for publication in the journal? It is anticipated that every Kewite will gladly become a subscribing member of the Guild, and also communicate any interesting professional information for publication in the journal. It will be seen that the aim and object of the Guild is the very laudable one of uniting all Kew men in a bond of fellowship by means of a journal which will convey to them news of interest, and enable them to communicate with each other. There are probably 500 Kewites distributed all over the world, but of the whereabouts of all except a small proportion there is at present no record. The Committee to carry out this scheme is composed of Messrs. W. Watson, W. J. Bean, G. H. Krumbiegel, J. Browne, H. Pettigrew, and J. Aikman. All communications should be addressed to the Secretary, J. Aikman, Whitestile Road, Brentford. It would save correspondence if members enclose their subscriptions when they write to the Secretary.

— **POISONING MOLES**.—Monsieur Ledain, the director of an agricultural school in Brittany, has asserted that moles may be poisoned by means of live earthworms which have been sprinkled with nuxvomica. The worms, he says, should be collected and left in peace for twenty-four hours to disgorge the earth they have swallowed. Then they should be put in a jar and sprinkled with the drug in the proportion of 30 grains to a saucerful of worms. Twelve hours later they will be ready for use; and then they should not be touched with the fingers, but taken up with little wooden pincers and put at the entrance of the mole galleries, being covered with clods or bits of tile in order that the mole may not be alarmed either by a current of air or a ray of light.

— **ROYAL BOTANIC SOCIETY**.—A meeting of the Fellows of this Society was held on Saturday, Major J. W. M. Cotton in the chair. Included in the objects of general interest exhibited at the meeting was a preparation by Messrs. Christy, of the Kola Nut, for a beverage somewhat resembling cocoa or chocolate, and possessing the same tonic properties as it, and tea, coffee, and other like beverages to a very high percentage. Plants of the tree producing the nuts were on the table from the Society's conservatory. The Secretary said that no thoughtful man could walk through the plant houses or museum in the Society's garden without noticing the vast variety of vegetable economic products provided by Nature, and at the same time being struck with the thought of the little use that had been made of them by civilised humanity. In the last fifty years enormous strides had been made in the use of steam, electricity, and machinery generally—not to mention iron shipping and explosive machines—for the service of man; but little attention had been given by commerce to the utilisation of new vegetable foods, beverages, fibres, and timbers, although their value was continually being brought to notice by travellers and scientific research. As an example, of the many valuable fibres only one or two new ones—and they not the best—*viz.*, cocoa-nut fibre and sparto grass—have been brought into extensive use during the fifty years.

— **EUONYMUS EUROPEUS**.—This seems to have been a good year for this berry-bearing shrub. Hereabouts the woods and hedgerows have been quite ablaze with the brightly coloured berries freely produced. Perhaps the greatest profusion of berries was borne on bushes growing in shallow soil over chalk, irrespective of position as regards aspect, although plenty are to be found carrying good crops of berries in stiff land. I came across a plant one day in a hedgerow that was laden with pure white berries, which formed a good contrast to others near of the more common colour. The natives here call it the "Skewer" Wood Tree.—E. M., *Hants.* [The "natives" are not far wrong. The common name of the shrub is the Spindle Tree, so called from its wood being used long ago for making spindles. It is called Prickwood and Pricktimmer, from being used for toothpicks and skewers. The wood is said to be used by musical instrument makers.

For skewers and toothpicks the wood should be cut when the shrub is in bloom, for then it is tough and not easily broken; it is also used by watchmakers for cleaning watches. The berries act as an emetic and purgative, and are fatal to sheep; and when powdered and sprinkled on the hair, destroy pediculi; sometimes it is made into an ointment for the same purpose. No animals, except the goat, will browse upon the plant.]

— **MEALY BUG ON VINES**.—Replying to your correspondent "Nemo" (page 505) as to what dressing we applied to our Vines, I may state that there was nothing special about it, being a mixture of clay soot, sulphur, Gishurst, and cow manure, with one wineglass of petroleum to a quart of water. The whole was simmered on a slow fire for, say, twenty minutes, and brushed well into every crevice of the Vines. The wood, glass, trellis, and walls had previously been washed with a strong solution of soft soap and petroleum. But I do not attribute our success so much to the dressing used as to not syringing it off when starting the Vines, and paying strict attention during the summer, destroying every insect as it appeared with a small brush dipped in petroleum. This was done, not every ten or fourteen days, but four or five times in the week; in fact, every bright day. I may add we are pruning our old Vines just now, and I am pleased to say there is not the least sign of bug to be seen in the house.—R. R., *Belfast.*

— **COUNTRY FRUIT MARKETS**.—I thank "A. D." for his well-intended advice on page 505, but under the circumstances it would have been impracticable to carry out. It may possibly be remembered that just as the bulk of the Green Gage crop were ripening it was a very wet time, and before the fruit was at its best for gathering nearly the whole were split, and especially the finest fruits fit for boxing as described. To have boxed up these would have been worse than doing the best one could of disposing of them at home at almost any sacrifice. The fact is we are too much at the mercy of the middleman, and when one has to depend upon one man it is even worse than when there is competition. In this particular case a dealer agreed to take my fruit on a certain day. It was gathered at some inconvenience and extra expense, mostly cracked, and needed using at once. The day came but not the man, and I have not seen him even yet. My own impression is that he was overstocked, and if fruit is put together damp and split it is spoilt before it could get into the consumer's hands in towns, and would probably be slaughtered in price and find its way into the tons of stuff that is made into town jam. No! Bottling and preserving fresh when the fruit was gathered was what would have been the proper course if it could have been carried out on a small scale on the Toddington principle.—J. HAM.

— **NEWCASTLE BOTANICAL AND HORTICULTURAL SOCIETY**.—At the annual meeting of this important northern Society, held on the 7th inst., Mr. Gillespie, the Secretary, reported that the payments during the year had amounted to £1425 7s. 11d., and, as the income was £1277 16s. 3d., there was deficiency on the year of £147 11s. 8d. The balance in hand had been reduced from £559 17s. 2d. to £412 5s. 6d. The Chairman, Councillor J. Baxter Ellis, in moving the adoption of the report and balance-sheet, said they required very little comment from him. In one respect they had to a certain extent their usual misfortune, but they had had misfortunes many times, and they had never been disheartened, nor did they intend to be this time. At the time of the spring Show, which they always looked forward to for material help, they had had extremely bad weather. For the autumn show they had had very fair weather; but still they had, and through no fault of their own, misfortune, for on one of the most important Show days there was a bye-election in Newcastle. There was no doubt whatever that that interfered very materially with the attendance at Leazes Park, and consequently, upon the year's working there was a loss of £147 11s. 8d., leaving the Society with a balance in hand of £412 5s. 6d. He had no doubt the Society would again overcome its difficulties, for there was one thing that always inspired them, and that was the knowledge that they enjoyed the entire confidence of the Newcastle people and the people of the North of England. Next year they proposed to join with the Northumberland Agricultural Society, which has been invited by the Corporation to hold its Show in Newcastle. He then referred to Mr. Gillespie's retirement from the office of Honorary Secretary, and acknowledged the value of his services during the last fifteen years. Mr. B. Plummer seconded the motion, which was carried unanimously. Ald. Gibson was elected President for the forthcoming year, with the Mayor of Newcastle (Mr. Edward Culley) Vice-President. Mr. Gillespie, in consideration of his valuable services, was invited to a seat on the Council, and has accepted the honour. The next spring Show has been fixed for April 19th and 20th.

THE ORCHID REVIEW.

ON January 1st, 1893, will be published the first number of an illustrated monthly journal, devoted exclusively to orchidology in all its branches, edited by Messrs. R. A. Rolfe and Frank Leslie. The prospectus states that the work will be specially devoted to the interests of cultivators of Orchids, and will be conducted on broad and independent lines as a general repertorium of information on every branch of Orchid lore. Among the subjects treated of will be found :—Descriptions of new species and hybrids, with their origin and parentage ; notices of interesting collections ;

crest, which adds considerably to its charm. It is obviously a useful Orchid for decorative purposes, inasmuch as it continues in full beauty for a long period.

CYPERORCHIS ELEGANS, BLUME.

Though this Orchid must have been introduced into England many years ago, it is still very rarely met with. It is a native of the Himalayas, where it was discovered by Wallich in 1821. It was originally classed as a *Cymbidium* by Lindley, and as such it is still generally known. *Cyperorchis elegans* is, as the name implies, a graceful plant, and though it may lack the brilliant colours of the *Cattleyas*, it is still sufficiently showy and attractive to merit a wider cultivation than it at present receives. It flowers during the months of November and December, and as the Orchid houses are as a rule not very gay at that season, it is surprising that this plant should have been so much overlooked. The leaves are strap-shaped, recurved, 12 to 18 inches in length by three-quarters of an inch broad. The tubular flowers are borne in a stout pendulous many-flowered raceme about 10 inches in length. The

FIG. 70.—SPATHOGLOTTIS VIELLARDI RUBRA.

portraits of interesting Orchids ; cultural notes by experienced cultivators, with a comprehensive calendar of operations ; geographical notes and sketches of Orchids at home ; biographical sketches ; reports of meetings and doings of the month generally, with any other matters likely to prove useful or interesting to lovers of Orchids. The price is 1s.

SPATHOGLOTTIS VIELLARDI RUBRA.

THIS charming variety was exhibited by Sir Trevor Lawrence at the Drill Hall on Tuesday, November 1st, when the Orchid Committee of the Royal Horticultural Society awarded it a first-class certificate. The plant shown, and from a sketch of which our illustration (fig. 70) has been prepared, bore a spike containing fifteen fully expanded blooms and a number of buds. The sepals and petals are of a bright purplish shade, as also is the lip, the latter, however, being a deeper colour, and possessing a yellow

individual flowers are about 2 inches in length and nearly an inch in diameter, greenish-yellow in colour, with a few spots of red on the lip.

This Orchid requires an intermediate temperature all the year round. It should be grown in a compost of fibrous loam, peat, and sphagnum in well-drained pots. Abundance of water is essential, particularly in the growing season.

A figure of *C. elegans* is given in the "Botanical Magazine," t. 7007, and a plant may now be seen in flower in the cool Orchid house at Kew.—A. B.

CALANTHES.

THESE plants, now coming into bloom, are so useful that it is well-nigh impossible to grow too many. Crowding should certainly be avoided, or injury results. As many as can have room to develop themselves properly during the later stages of their growth only

should be grown. Any surplus stock may be cultivated in baskets and suspended from the roof. These are not only effective when in flower, but they are useful for cutting, and thus save those grown in pots for other decorative purposes.

Calanthes do well in a compost of two parts fibry loam to one part of peat; sand should be added, a little charcoal, and some cow manure that has been passed through a sieve. Leaf mould may be substituted for peat. Last year I did not use peat, and the plants improved in size and the spikes were larger. The pots should be well drained, and the pseudo-bulbs potted just below the rim. The soil being of a light nature will settle and leave sufficient room for water by the time they are in active growth. If the pseudo-bulbs are placed in small pots to start with they may be slightly elevated above the rim. At one time I followed this practice, but it is not necessary, as I have found the plants do equally as well when placed at once in the pots in which they are to flower.

After potting the plants should be placed where the temperature at night does not fall below 60°. The atmosphere should be close and moist; very little water will be needed at first, if over-watered *Calanthes* rarely do well. No more should be given than is really necessary to keep the soil from becoming dry. The supply should be gradually increased as the roots and growth are developed.

Those to be placed in baskets may be started a number together in small pots. This I consider a good plan, as there is not the liability to give them too much water as when placed direct into baskets. Where the watering can be carefully attended to they can be placed into the baskets to start with.

Few Orchids deserve more care or attention; they well repay for the room they occupy and the labour expended upon them. A small house filled with them, when *Adiantum cuneatum* is employed as a groundwork, is most effective at this time of the year.—G. O.

PRICES AND QUALITY OF APPLES.

YOUR correspondent "W. P. W." (page 502) hits the right nail on the head. The successful man in fruit growing in the future will be he who, no matter what may be the number of his acres, grows fine fruit, of good appearance and quality. It often annoys me to hear people say that fruit tree planting has been overdone, is being overdone, and that our markets are glutted with Apples which will not pay for the expenses of pulling and conveyance. Of course the markets are glutted with a certain sort of Apples, or rather I would say with fruit which by courtesy are called Apples, but which would more fitly be described as Crabs. These miserable specimens, the produce of old, worn-out, starved to death orchards, are simply almost unsaleable, and the sooner their owners recognise the fact the better it will be both for themselves and the public. Every market man knows the truth of all this, and were proof required it might easily be furnished. I well remember one day in 1890 going into our local market and seeing tons of these poor Apples selling with difficulty at 3s. per bushel, when a man from the country arrived with a cartload of Apples grown upon pyramid trees, and sent in as they should be in prime condition, well coloured, and carefully handled. What a commotion he made. The lately unwilling purchasers rushed after him, and almost before he could unload his hampers the fruit was sold at 16s. per bushel; those who secured it looking upon themselves as fortunate, whilst many went away grumbling because they could not be supplied.

Do we want another picture? In the *Journal of Horticulture*, December 3rd, 1891, we read that the imports of American Apples into Liverpool during the first half of the previous season (1890) were 96,628 barrels, whereas up to the date of that issue, or half the season (1891), they reached the enormous number of 369,880 barrels. Again, I take up a market report of October 7th, 1892, and find that the imports for that one week were—Liverpool, 36,000 barrels; Glasgow, 16,000; London, 13,000; making a total of 65,000 barrels sent into three of our ports during one week. Does this look like a falling off in the demand? Then, again, the prices in 1891 ranged from 10s. to 20s. a barrel, whilst in 1892 they ran from 12s. to 18s., showing no diminution in price. It is scarcely necessary to say that this enormous and growing demand for American Apples is not from any merit they possess in point of quality, for the cooking varieties are not to be compared with good English fruit, but simply from their size and the fact that they are sorted and all the small ones left at home. Of course I expect to be told that if the cooking varieties are inferior to our English fruit the Baldwins and Newtowns are quite the reverse. That may be the opinion of some, especially those to whose weak digestions the soft and melting fleshed American Apples are suited; but I am sure the great majority will give their vote in favour of

a neat, well-coloured, crisp Cox's Orange Pippin, a verdict which I most heartily endorse.

Your correspondent's remarks are just what is wanted at the present moment. As he says, the old-world growers must find out by bitter experience that they are out of date; but there are numbers who contemplate planting, and yet fear to launch their bark, hearing these dismal rumours of bad sales. To such, if there be any, who read your "Journal," and probably, being seekers after knowledge, there will be many, I would say, Be bold. Fruit culture is yet in its infancy; with a population consuming less than half the quantity of fruit per head than our Continental neighbours eat, with allotment gardens multiplying in our midst, and growing a few fruit trees just to whet the appetite and educate an enormous new fruit-eating public, there is every prospect that the demand for good fruit will increase by leaps and bounds. Only one word of caution is needed, Plant good kinds suitable to your district, and do not plant more than you can properly manage. Let the lesson of poor starved fruit be always before your mental vision, but never in your sight.—A. H. PEARSON.

THE price of the Domino Apples—namely, 4s. 6d. per bushel, as stated by your correspondent "W. P. W.," in your last issue, page 502, is widely different from 6s., which was stated previously, and which I suppose was a price estimated before the fruit was gathered. I should also like to know whether 4s. 6d. is the market price or the net price home, for if it is the market price it would be reduced to 3s. 6d. or 2s. 6d., according to distance of the market. The average price, as stated by me in your issue of December 1st, was 2s. 9d., not 2s. as your correspondent quoted, so that our prices are not so widely different as appeared at first, especially if 1s. 6d. a bushel is considered as immaterial. The price of 2s. a bushel, mentioned in my last communication (page 478), was an extreme price. Is 4s. 6d. a bushel also an extreme price—the other way?

"W. P. W." then refers to the different prices received by two different growers in Kent, the one a large grower whom he thinks does not attend well to his trees, and the other a small (?) one who only has 100 acres of ground, and who cultivates his ground well (respecting which your correspondent gives some interesting details), and by inference implies that I am to be classed with the former. In defence of my position and prices which I receive I may be allowed to state some facts without being considered boastful. My ground is at present only about 40 acres, all of which is under fruit cultivation, and which is my own property. My wages bill for men averages about £10 a week, or £500 a year, and for women as much as £30 a week in the season. My manure bill I estimate at about £500 a year, so that I do not think it will be considered I neglect my ground either as regards cultivation or manure, and from the wages of the women it will be seen that the crops are usually heavy, for three-quarters of the ground has only been planted five years. Then as regards marketing. I send to the principal markets of England, Scotland, and Ireland, and from the three towns to which I have sent most constantly my salesmen have told me, unsolicited, that my fruit is acknowledged to be the finest and best packed that goes into them, and that it always realises the highest prices. The other salesmen give similar testimony. Because of my knowledge of the markets I am able to buy a quantity of fruit from various other growers within a radius of ten miles, as I can give them a higher price than they can otherwise get. Last year I bought about 130 tons, and this season about 60 tons. My outlay for baskets is about £800, and increases every year.

I think I have said sufficient to show that my prices may be taken as at least fairly representative ones, and also that a considerable amount of capital is required for working a fruit farm well, as there are horses, vans, and many other things to take into consideration. Of course higher prices can sometimes be obtained from a special customer. My object in writing in the first place was simply in order that readers of your journal should not be misled by seeing 6s. a bushel stated as the price of Apples, when the average price of good sorts of Apples home to the grower has been very much less. I am glad to find that my views are supported by "one of the largest fruit growers in Kent."

From statements which have appeared in some of the horticultural and other papers two things might be considered as axioms—first, that the present race of fruit growers are a set of blockheads; and secondly, that if readers would only go into fruit growing it would be a sort of Eldorado. I do not think that "W. P. W." wishes to imply this, but the effect of his remarks, coming after such statements, must be taken into consideration. I do not deny there are some very poor fruit growers, as there are lawyers, gardeners, and others; but I hardly think all are to be considered as belonging to this class.

There are hundreds of men on the look-out for the best sorts,

and ready to extend their plantations almost indefinitely if fruit growing pays well, the one question with them being, Will it pay? I do not say there is no profit in fruit growing, but it is not the lucrative business that it is estimated to be by some people; and I still adhere to my statement, that in consequence of the low price of fruit growers have to enlarge their holdings to get the same profit as they used to do from a smaller extent of ground. A few years ago 3d. per pound, or 6s. per half sieve, was the usual price for Black Currants, as Lea's "Small Farms." The average price home per half sieve from London markets from 1882 to 1888 is as follows:—4s. 1d., 2s. 10d., 3s., 4s., 1s. 8d., 3s., 3s. 3d. Since then it has been higher, but crops have been light the last two years.

I quite agree with your correspondent as to the benefit of good cultivation, and I think in the main our views are the same. I repeat what I said before, that it is my opinion that if fruit growing is to pay the best sorts must be grown, and the fruit cultivated and marketed in the best manner.—WALTER KRUSE.

ONE reason for the prices of Apples being so low in the autumn is the glutting of the markets with "windfalls," the result of heavy gales. These have been sold as low as 1s. 6d. a bushel. One grower picked up and took into the market sixty bushels of fallen Apples in one day. A second reason why Apples are so cheap at Michaelmas time is that so many "little people" have their year's rent to get ready that off goes the fruit, good or bad in quality, to the market and sold for what it will fetch. The two causes named are sufficient to glut any market for a time with inferior fruit, and for which there is no present remedy. It is not in the power of the persons alluded to to destroy the old and inferior trees and to plant new, they being the property of someone else. In spite of this, though, good fruit finds a fairly quick sale. One grower of about eight acres of mixed fruit told me a short time since that he had grown fruit for twenty years, and the better he grew it the better he could sell it, and notwithstanding increased competition he had no trouble to get rid of all he could grow at good prices.—E. MOLYNEUX.

THE NATIONAL CHRYSANTHEMUM SOCIETY.

I WISH Mr. Charles E. Pearson would drop such a term as "metropolitan exclusiveness." The Floral Committee is openly elected by the General Committee at the first meeting after the election of one-third of the number of the latter, a meeting to which all representatives of affiliated societies are invited. We generally get sixteen to eighteen candidates nominated to fill the five vacant seats on the Floral Committee, and the contest is always a spirited one, and the voting remarkably even. It is an excellent opportunity for the representatives of affiliated societies to nominate from the provinces, but they do not do so. In an open election, with on an average from fifty to sixty persons present, how can there be "metropolitan exclusiveness?" I think the Floral Committee adequately and completely represents all classes of Chrysanthemum cultivators. If Mr. C. E. Pearson will send me the names of two or three provincial growers, members of the Society, qualified in his opinion to be members of the Floral Committee, I will take care they are duly nominated for election; but I cannot in any way control the voting. It appears to me to be a mere waste of time to discuss the question alluded to in the latter part of Mr. Pearson's communication until he himself or those who think with him are prepared to indicate an alternative place. I am repeatedly challenging objectors to do so. I am still waiting for them to name a more suitable building so central and so readily reached from all parts.—RICHARD DEAN, *Secretary*.

THERE are numbers of persons like your correspondent Mr. W. H. Divers (p. 509) who are looking out for a satisfactory issue of the matter that has been brought before the N.C.S. by Mr. Godfrey. Mr. R. Dean, like the good secretary he is, appears ready to pitch full tilt at anything and everything that turns up; but no amount of noise and bustle will silence the real question in which the public are interested, and what we require from the Committee is a straightforward and definite expression of opinion on the subject. Either Mr. Godfrey has made unfounded charges against a member of the Committee or they are substantially true. Why all this delay in an explicit statement? The allegations are either true or untrue. The case could be settled beyond all dispute in a few hours. The best thanks of the Chrysanthemum world are due to the Editor of this Journal for the impartial manner he has treated the whole question. I am beginning to form the same opinion of the Floral Committee as a very prominent exhibitor has done—namely, there are far too many tradesmen on it. Surely there

are sufficient Chrysanthemum specialists to act as the Floral Committee without trade growers. This would place the nurseryman above the suspicion of voting on the side of his bread and butter. I am exceedingly pleased to see we have no anonymous writers on this matter, which serves to show clearly every one has the courage of his opinions and the boldness to express them.—JAS. B. RIDING, *Chingford*.

CROYDON CHRYSANTHEMUM SHOW.

WE are informed that the Borough of Croydon Chrysanthemum Society's Exhibition will be held on November 8th and 9th next year.

CHRYSANTHEMUMS IN THE ANTIPODES.

WE learn that an Australian Chrysanthemum Society has been started in Sydney, New South Wales, and another at Cambridge in New Zealand. From this one may infer that the Chrysanthemum is becoming as popular in the colonies as it is in this country.

CHRYSANTHEMUM W. W. COLES.

EARLY formed buds of this variety invariably produce yellow blooms, or nearly so. The florets in this case are fluted at the base, more so than in those developed later. From the remark made by "J. H. W." (page 509) "in every case the yellow blooms appeared first" leads me to infer that the suggested sport appeared on several plants, which strengthens my opinion that the yellow blooms are the result of early formed buds rather than a distinct sport.—E. M.

MONS. R. BAHUANT.

I SHOULD very much like to know the proper pronunciation of Mons. R. Bahuant through the medium of the *Journal of Horticulture*.—JOHN BULL.

[It is not easy to clearly represent the pronunciation of many French names in print. In this case Bahueang is suggested for improvement by expert orthoëpists. The "h" is not pronounced so forcibly in French as in English, and the "u" has much the same sound as "ue" in *flue*.]

CHRYSANTHEMUM VIVIAND MOREL.

ALTHOUGH the quality of the blooms shown of this variety have not been of such all-round excellence as they were last year, when fewer were staged, it has been sufficiently good to rank as the best Japanese of the year. From statistics gathered from the report of twenty-five Shows, where a prize was offered for the best Japanese, Vivian Morel won fifteen times. The poorer quality of the blooms may be accounted for by the fact of there being such a "run on" this variety; owing to the wonderful manner in which it was exhibited last year, compelled nurserymen to propagate closely to execute orders.—E. M.

THE HARTLEPOOL CHRYSANTHEMUM SOCIETY.

THE Committee of this Society are to be congratulated on the success of their last Show. Starting the year with a balance on the wrong side, and after paying all prize money and expenses incurred, the Treasurer's balance-sheet now shows £42 7s. 4½d. on the right side. The Committee made determined efforts and had ready help afforded them in various ways, particularly in respect of the generous offer of Capt. D. G. Irvine to provide a magnificent band, which was thankfully accepted, and the splendid selection of high-class music rendered by it contributed greatly to the enjoyment of those present, besides attracting large numbers of visitors. In recognition of the untiring services of the Honorary Secretary, Mr. A. Taylor, gardener, Broomhill, a silver albert was presented to him through the Chairman, Mr. J. F. Wilson, on behalf of the Executive Committee.—G.

JOHN FARWELL AND VIVIAND MOREL.

WE send by post a couple of blooms of this variety for your inspection. These will give you an idea of the size and form, though not of the colour, they being considerably past their best. The fresh blooms are a beautiful rich crimson, one of the most distinct colours we have. We also send a photograph of a plant of Vivian Morel, carrying four of the finest blooms we have yet seen. The largest of them measured 14½ inches in diameter when the florets were held up horizontally.—J. R. PEARSON AND SONS.

[The blooms of John Farwell were large and massive, full of narrow, semi-fluted florets, and borne on strong, clear stems. Such plants as they were cut from would be effective in groups, as also would Vivian Morel, grown so well as it is represented in the photograph in question.]

SENDING CHRYSANTHEMUM CUTTINGS BY POST.

THE condition of some cuttings just to hand through the medium of the parcels post has prompted me to write a note on this subject. If private gardeners would only copy the Chrysanthemum specialist in this there would be no need for any suggestion on my part. Unfortunately they will not take a hint. The worst form of packing cuttings to go by post (and I am sorry to say it is a plan very often adopted) is that of wrapping them in cotton wadding, simply encasing that in brown paper. Sometimes a label is attached for the address and stamps, but where this is absent the cuttings are very often smashed by the force in which the post office stamp is employed. The wadding absorbs the moisture from the cuttings. When these are weakly, as is very often the case with new or scarce varieties, the chances are that the bulk of those packed in that manner fail to strike. Cuttings are sometimes sent simply enclosed in an ordinary letter without a vestige of packing

except that afforded by a sheet of note paper. Freshly gathered damp moss is the best material for packing, and light tin boxes the most suitable receptacle for sending them in, even better than wood; no absorption of moisture takes place when packed in tin boxes. A thin layer of moss at the bottom of the box and on the top of the cuttings keeps them fresh and cool for several days if necessary. If a quantity of cuttings are sent a layer of moss between occasionally is useful.—E. MOLYNEUX.

[Specimens of flowers sent to this office to be named invariably arrive in the best condition when packed in damp moss or soft freshly cut grass in closely fitting tin boxes. Those which arrive in the most withered state are enclosed in dry wadding, while many are spoiled by being crushed in the post. Our experience is in close accord with that of our correspondent in his well-timed note on packing cuttings of Chrysanthemums.]

PREMIER BLOOMS.

WHETHER or not the blooms that gain the premier award are found in the prize collections, I think the offering of such is attendant with some beneficial results. If only to educate the ordinary sight-seer as to what constitutes an ideal bloom in each section something is gained. Many times have I heard the remark in a show room, "Amongst all these blooms I wonder which is considered to be the best." The notification of the premier award settles this query. Although such awards do sometimes go to the prize stands it is not invariably the case. At one large exhibition this season, where close upon 2000 blooms were staged, the premier Japanese was found in an unplaced stand, a result keenly appreciated by the owner. I have known the premier bloom in the incurved section found in an amateur's stand, even when professional growers were taking the leading prizes in the "thirty-six" classes. The recipient in question felt not a little proud of the achievement. Seldom are the blooms anything like as good when a class is specially made for one instead of selecting the premier from any stand, and in no sense can they lay claim to the premiership in an educational point of view. Some societies offer a silver medal for the best bloom in each section. This is an honour much coveted by the recipient.—E. M.

CHRYSANTHEMUMS IN THE LONDON PARKS.

"VISITOR'S" note (page 481) on this subject seems rather ill-natured. One would have thought that the proposal to give some awards to the superintendents of the County Council parks for the best display of Chrysanthemums would have been received with pleasure, and have shown that the County Council was evidencing more than an ordinary interest in the work of their park superintendents. As to the making of such awards, it requires no exceeding ability to discern after careful scrutiny by any impartial person which of the parks had the best Chrysanthemum show. It is so obvious that the County Council desire to give their park gardeners all possible encouragement, that the note struck by "Visitor" seems very discordant. It is true all have not the same facilities, but no doubt efforts will be made presently to put all the parks so far as possible on the same footing or basis.—D.

CHRYSANTHEMUM MRS. A. HARDY.

IN looking through the reports of the recent Chrysanthemum shows it is noticeable how few times this variety has appeared upon the exhibition boards. I may not be correct, but I do not think it has been exhibited many times this season; the reason, I suppose, is the difficulty in its culture. I have seen several collections this season, but I have only seen one good bloom of it, and that was exhibited at Cardiff. I have tried to grow it for two seasons, but have failed to get a decent bloom. Some say grafting it is the best way to succeed, so last spring I inarched it on a strong plant of Fair Maid of Guernsey, and although it grew strongly for a time it failed to produce a bud. The best blooms I ever saw of it were exhibited at Bristol last year by Messrs. Drover, and I believe they showed some good blooms of it again this autumn there. I have no doubt it would be interesting to other readers besides myself if some of the successful growers would record their mode of culture in the *Journal of Horticulture*. It seems a pity that such a good thing cannot be more often seen.—R. M.

GOLDEN WEDDING.

IN a report of the New York Show, sent to us by an English visitor, and published in our issue of the 24th ult. (page 462), the above variety is alluded to as follows:—"Golden Wedding of Peter Henderson & Co. is by a long way the finest and largest golden yellow Japanese incurved I have yet seen. It was awarded the first prize for the best variety in the Show. Messrs. John Laing & Sons, Forest Hill have secured the European control of this grand sort." In reference to that precise statement, Messrs. H. Cannell & Sons write as follows:—"We had, as far as we knew, purchased a stock of Golden Wedding Chrysanthemum from Messrs. Peter Henderson of New York before we saw it stated in the 'Journal' that Messrs. Laing & Sons had the control of the whole stock in Europe. We immediately wrote Messrs. Peter Henderson to telegraph either 'Yes' or 'No.' The enclosed is their reply, appointing us to have control of distributing the above variety in Europe." The telegram sent to us by Messrs. Cannell, as handed in at the New York office at 5.15 P.M., and received at Swanley 5.56 P.M., December 6th, is, "Yes.—Tritoma." Can the confusion have arisen through Messrs. Peter Henderson & Sons having sold stock to both the firms in question? We shall be obliged if the great American firm will supply us with information on the subject. After what has transpired there is bound to be a sharp look-out for Golden Wedding Chrysanthemum in England.

NEW CHRYSANTHEMUMS.

(Continued from page 510.)

INCURVED.—*George Cockburn*.—A bronze coloured sport from Princess Beatrice, but having all the appearance of making a larger bloom than its parent. The foliage is remarkable for its robust character. As a front row bloom this should be of service. Experienced adjudicators always think highly of Princess Beatrice when in good condition on account of the difficulty in obtaining it so.

Princess Alice.—I saw this in a stand at the Exeter Show, but whether new or old I am unable to say. I cannot find it mentioned in any catalogue or book. The bloom reminded me very much of Jeanne d'Arc in its form, only the petals were not quite so toothed; the colour was deep pink and quite pleasing.

JAPANESE.—This section has been enormously added to during the last year from all quarters of the globe, I might say, in addition to the many English raised seedlings which are being annually introduced, and not only the French but the American raisers will have to look to their laurels in the matter of introducing the finest varieties. So numerous and good as the finest in this section that I shall class them under their different colour, commencing with white varieties, as without doubt they are the most popular.

Beauty of Exmouth (Godfrey).—This has created much interest of late. I look upon this variety as one of the finest whites in existence. It is an English raised seedling, Avalanche being one of its parents, which is a sufficient guarantee of its form being good. In colour it is ivory white; the blooms are massive, from 7 to 8 inches in diameter and proportionately deep; the florets are narrow, incurving as the blooms expand; with development the florets straighten outwards, some still retaining the curl at the tips. I have seen blooms produced from early crown buds, and I have seen them on terminals grown in quantity, and in all stages it preserves its steadfastness. It is undoubtedly a grand variety and has obtained thirteen certificates.

Marquis de Paris.—This is not a giant, but it is one of those full solid flowers that exhibitors would do well to make a note of. The florets are moderately broad; from early buds many are split or forked at the tips. It is dwarf in habit, a step in the right direction.

Princess May (Agate).—An English seedling of the purest white. The florets are long, narrow, and droop in a charming manner. It is a full solid flower of large size; the habit of growth is quite of the best, being sturdy and not too tall.

Gaetano Guelphi.—This belongs to the medium sized class, and is a pure white; the long narrow florets curl at the point and droop gracefully. It is altogether a charming addition to an already numerous section.

Madame Leblanc.—A snow-white flower, with broad flat florets, slightly pointed; a full and promising variety.

Mr. C. Myers.—This belongs to the class known as October flowering varieties, much in the style of Eynsford White, but smaller; useful where early white flowers are required.

BRIGHT COLOURED VARIETIES.—As usual, there are not added in large quantities, but a distinct advance has been made even in this respect by varieties raised by Mr. Shrimpton.

William Seward.—Just the colour that has long been wanted—purple crimson, reverse of the florets gold, although little of this is seen in fully developed blooms. When the florets are unfolding the gold is visible. This variety will do much toward brightening many stands which lack colour; white, yellow, and lilac tints very often predominate. This new variety is devoid of any semblance to coarseness. The florets are narrow and semi-drooping, the flower being quite full in the centre. Well developed blooms measure nearly 8 inches in diameter. The habit of growth is said to be of the right kind, from 4 feet to 5 feet high. Taken altogether, I look upon this as one of the chief novelties of the season, for never have we had such a well formed flower of such a striking colour.

James Shrimpton.—Another extremely bright coloured variety from the same source. To say at once that it is an immense Cullingfordi would be the most exact and easiest description, as undoubtedly it is. Taken altogether it is a magnificent front row bloom, and a grand companion to Avalanche.

G. W. Childs.—Apparently a seedling from Edwin Molyneux, which it much resembles in form and colour, except that there is a suffusion of plum colour on the surface of its florets, especially in its young state, more dense than in its parent.

Beauté de Toulousaine.—This has flat florets of a rich red colour, very promising as an exhibition variety.

C. Shrimpton.—Somewhat like Gloire du Rocher, but with broader and longer florets, brighter in colour.

Excelsior.—An English seedling; a full-centred flower, the florets not too stiff. The colour is bright rose-cerise, the under side of the flat florets silver. It is decidedly a conspicuous bloom in a stand, and one that exhibitors should make a note of.

G. C. Schwabe.—This has been largely exhibited during the past season, and is a flower deserving of encouragement, as it possesses quality, having fairly broad florets which are quite full in the centre; the colour is distinct and pleasing, bright carmine rose. A seedling from Edwin Molyneux, of which it partakes in habit of growth.—E. MOLYNEUX.

N.B.—A mistake has occurred in placing Chrysanthemum Mr. A. Jacobs in the incurved list on page 510. It is a Japanese.—E. M.

(To be continued.)

FRUIT—A PLETHORA OF VARIETIES.

UNDER the above heading a correspondent on page 500 of your valuable paper of December 8th mentions my collection of Apples exhibited at the Hereford Fruit Show, and goes on to ask if it is a healthy sign to find so many varieties offered to the public. I may say that my collection contained about 270 distinct varieties, with about thirty varieties of Pears, but not including cider Apples, which were in a separate collection shown in a different part of the building. When I mention the fact that it was subdivided into four different divisions—viz., The best Apples to grow for market (containing only about twenty-five varieties), a general collection of culinary Apples, a general collection of dessert Apples, and the best flavoured dessert Apples (containing about thirty varieties), and that on the name card attached to each variety a few words were added as to its season, qualities, &c., not always praising it, but when necessary showing its bad qualities, as "Cellini, liable to canker on some soils," "Old Golden Pippin, too small," &c., I think even your correspondent will acknowledge that a large collection may be educational. I think myself that it is often very much so, as it shows growers, side by side, with varieties of which they have had a high opinion, other sorts greatly superior.

I think such collections are quite as instructive, if not more so, as small collections (shown for competition), which usually contain a good proportion of sorts useful for exhibition only. My chief object in writing is not, however, to describe my own collection, but to open up the subject as to whether our nurserymen can reduce their lists, and if so to what extent; and I think your correspondent will find this a much more difficult question to answer than he thinks. A nurseryman who does more than a local trade has to cater for different persons, who look at fruit growing from very many points of view. 1st, There is "the grower for market only;" 2nd, "The grower for private consumption only;" 3rd, "The grower who likes to exhibit sometimes;" and then there is "the grower who makes a hobby of fruit growing, who takes a pleasure in seeing the variations in colour, size, and qualities of the different varieties; who likes to test those sorts, new or unknown to him, and find out their suitability for his soil or climate, without thought of profit." I will treat first with "the grower for market."

I have never advocated that the grower for market should go in for a large number of varieties, and in a short paper I read before our local Chamber of Agriculture in 1885, almost before the revival in fruit growing began, on "Profitable Fruit Culture," I said, "Do not plant too many sorts; plant sufficient of each variety to pay you to pick and market a bulk of each variety separately." These are still my views; in my own plantations I have planted to grow fruit for market. I do not think I exceed eighteen varieties, but if I lived in a different county, or on a different soil or even aspect, it is very likely these sorts would be greatly changed. My advice to growers for market has always been, Test fresh varieties on a small scale, find out those sorts which suit you, and plant those only largely.

2nd, There is "the grower for private consumption." I find tastes vary in Apples as in other things. There are many different tastes; some like a highly aromatic Apple, others a sharp crisp one, others again a soft-fleshed Apple. They also want more variety and sorts to last in succession over as long a season as possible, and to meet all requirements as dessert or cooking Apples. Many do not look at the cost of production so long as they can have Apples of their own growth.

3rd. There is "the grower for exhibition," who likes to have handsome dishes of fruit for showing or on his table, independent of whether they are heavy croppers, or of good quality for dessert or cooking. There is also "the grower for pleasure." Why should not such a man have as great a variety of Apples as well as flowers? A beautiful Apple gives as much pleasure to a pomologist as a beautiful flower to a florist. Again, if there were no growers who tested new or little known varieties, when would the qualities of those come to light? Your correspondent's own list contains sorts not long introduced and which have been little tested yet on a large scale and in different localities. We can advance in varieties of Apples as in other things.

To add to all this, there are "varieties most suitable to grow as dwarfs," "varieties most suitable to grow as standards," and others "most suitable for ornamental planting, either for the beauty of their fruit or flowers," "varieties most suitable for different climates, localities, or soils, north, south, east, or west." In either of these localities I could name Apples known chiefly or only locally, and hardly ever seen in a nurseryman's catalogue, which succeed admirably in their respective districts, and are known well in them for their good qualities, and which withal sell well in their markets. Your correspondent gives a list of forty-three varieties, which he states "we really cannot do without," and of course does so honestly, from his point of view and experience; but I could name scores of varieties which from my point of view are far better than at least one-third of them. Besides my full catalogue I issue a short one, containing only about fifty varieties of Apples, which I believe from my experience to be most reliable. But how often am I asked for my full catalogue, as the sort wanted and thought most of is not in the shorter one?

Your correspondent asks how many varieties are grown in America, and queries "Not 270 by any means." I have a catalogue before me, issued by one of the largest firms of nurserymen in the United States, who have 175 names of Apples down in their list, and sixty-eight of these they recommend for extended cultivation; but, strange to say, there are only twenty of all these I have ever heard of as being cultivated in England, and only seven which are anything like in general cultivation here. So I think it is more than probable that at

least 270 varieties of Apples are grown in America. I think where the Americans chiefly beat us is that they only send us their best fruit, properly graded and packed, keeping their inferior at home for other purposes; but this matter is gradually being righted, as we are going forward, and the Americans, if anything, are going back in this respect.

In conclusion, I think that only when nurserymen have to cater for the wants of growers for market in Kent, or the old redsand formation of Herefordshire, or any other favoured locality, will the nurseryman's list of sorts who has more than a local trade, be within your correspondent's ideal number.—JOHN WATKINS.

IXIA LILIES.

THE two "Ixia Lilies" known to horticulturists—namely, *Ixiolirion montanum* and *I. tataricum*, are both attractive border plants, and form welcome additions to any collection of hardy favourites. They are suggestive of *Camassia esculenta* in the form and colour of the flowers,

FIG. 71.—IXIOLIRION MONTANUM.

especially the first-named, which is represented in the woodcut (fig. 71), but they are not quite so strong growing as that, though very free and floriferous. *I. montanum* has been found in Persia upon the hills about Teheran and in other similar districts of temperate Asia. It is quite hardy in the neighbourhood of London permanently planted out in the borders. A moderately good soil appears to suit it better than one that is very rich, as in the latter case the growth is excessively luxuriant and the flowers proportionately few. In a well-drained position, where the bulbs become thoroughly matured, flowers are annually produced very freely, and are not only attractive in the borders, but afford a useful supply for cutting, the bright purplish blue colour being most agreeable for associating with the numerous other tints, which are more common.

I. tataricum differs little from the preceding, and the cultural observations are equally applicable to both. This species has more expanded, less tubular flowers than the other, and the colour also is rather lighter, though this varies to some extent in different plants according to the situation they occupy and their vigour. It is also more limited in

its geographical distribution, being confined to the Altaic range of mountains. Both the species have been referred to the genus *Amaryllis* by some writers, *Ixiolirion* being one of the genera founded by Dean Herbert.

ROYAL HORTICULTURAL SOCIETY.

DECEMBER 13TH.

THE first of the winter meetings at the Drill Hall, and the last of the season, proved very bright and attractive, for the large room was well filled with exhibits. Chrysanthemums were very numerous owing in part to the lateness of the season, and some were of remarkable excellence, while Orchids were numerous and fine. A special word is also demanded by Mr. G. Paul's English-grown *Azalca mollis*, in bloom at the middle of December. There was not an extensive display of fruit.

FRUIT COMMITTEE.—Present: P. Crowley, Esq. (in the chair); with Rev. W. Wilks, Dr. Hogg, and Messrs. John Lec, A. W. Sutton, J. Cheal, G. W. Cummins, J. T. Saltmarsh, W. Warren, A. Dean, G. Taber, A. H. Pearson, G. Norman, H. Balderson, F. Q. Lane, J. Hudson, G. Sage, J. Smith, W. Bates, J. Willard, G. Bunyard, and J. Wright.

As will be seen there was a good attendance of members at this the last meeting of the year. On the last occasion a dish of very large kidney Potatoes was placed before the Committee, sent by Mr. Fidler, and named *Colossal*. As the variety had been grown at Chiswick, and proved satisfactory as a cropper, free from disease, Mr. Barron was requested to have some tubers cooked. This was done, and they were reported by him as being excellent in quality. He selected medium-sized tubers. Mr. Wilks had a large one tried, and it was hard in the centre, or to use the common expression, had a "bone" in it. The Committee awarded a first-class certificate for the variety. It was raised by Mr. Brawn of Walsall.

Mr. Barron again placed on the table a bunch of the White Gros Colman Grape, previously certificated, showing that it will at least hang till nearly Christmas. The quality was excellent, far superior to its black prototype. This Grape was raised by Mr. T. Bradshaw, gardener to the Marchioness of Downshire, Hillsborough Castle, Co. Down.

Mr. John Crook, Ford Abbey, Chard, sent fruits of his Fordiana Tomato, medium sized and well coloured, but no award was made. Messrs. Vertegans & Co., Chad Valley Nurseries, Birmingham, sent fruits of *Diospyros Kaki*, a Tomato-like fruit, a mixture of sweetness and acidity, the latter greatly preponderating. It has often been tried in this country, but has never been found satisfactory even under glass (vote of thanks).

Mr. C. Turner, Slough, sent a dish of Knight's Monarch Pear. Mr. Knight accidentally distributed two of his seedlings under that name, and some of the Committee thought this the accidental one, but good all the same.

Mr. J. Toogood, Alwalton Hall, Peterborough, sent a seedling Apple, some of the fruits resembling New Hawthornden, but faulty in quality, and therefore passed. Mr. G. Cummins, gardener to A. H. Smee, Esq., Hackbridge, sent a dish of Apples—Smee's Seedling—a small dark Nonpareil-like fruit, thick skinned, and too dry to meet with much favour, and no award was made. Mr. Cummins also sent fruit of the Remborough Apple, medium-sized, and tree said to bear well. Mr. Barron was requested to see it in the summer. The Apple seems to possess a blending of the characters of the Blenheim and King of the Pippins. Mr. C. Princep, Buxted Park, sent fruits of Apple The Spires, a large Calville-like fruit, but wanting in quality, and passed.

Mr. H. Bannister, gardener to H. St. Vincent Ames, Cote House, Westbury-on-Trym, sent fine specimens of a seedling Apple resembling Cobham. The Committee desired information on the character of the tree, and to see fruits again next year. Mr. E. Corkey, Frome, sent a dish of seedling Apples, not very unlike Golden Noble in appearance, but inferior in quality (passed). Mr. James Hudson brought specimens of Golden Noble and Waltham Abbey Seedling to show that the varieties are distinct. The trees are also dissimilar in habit. The dissimilarity was admitted by the Committee (vote of thanks).

Messrs. Cooper, Taber, & Co., Witham, Essex, sent tubers of their new Potato Duke of York, a flattish kidney, said to be of good quality and a free cropper, $7\frac{1}{2}$ tons having been grown on 70 rods of ground. It is to be further tried and reported on as a variety of promise.

Mr. Barron selected from the fruit-room at Chiswick dishes of twelve varieties of Apples, suitable for dessert at Christmas—namely, Baumann's Red Winter Reinette, King of the Pippins, Beauty of Hants, Cox's Orange Pippin, Rosemary Russet, Wagener, Braddick's Nonpareil, Dutch Mignonne, Cogswell, and American Mother. Seventy varieties of Beet were also brought, but the most distinct feature about most of them was displayed by the names.

At the close of the proceedings Mr. Crowley conveyed the thanks of the Council to the members for their services during the year, together with his acknowledgment of the support that he had received from his colleagues. On the proposition of Mr. J. Cheal the thanks of the Committee were unanimously tendered to Mr. Crowley for his business aptitude and the unfailing courtesy displayed by him at the meetings.

FLORAL COMMITTEE.—Present: W. Marshall, Esq. (in the chair), Messrs. R. Owen, R. Dean, H. Herbst, G. F. Bause, H. B. May, G. Nicholson, F. Ross, R. B. Lowe, G. Gordon, W. Furze, W. Bennett-Poë,

E. Mawley, C. J. Salter, T. Baines, Harry Turner, John Fraser, G. Paul, B. Wynne, W. H. Williams, and Rev. H. H. D'Ombraim,

Chrysanthemums formed a very conspicuous feature, half filling the central staging. Mr. W. Wells sent a collection of mixed varieties, including a promising white Japanese named Mrs. Jerome Jones, which is noteworthy for its very substantial florets. Mrs. Libby Allen was also conspicuous (bronze Banksian medal). Mr. Blair, Trentham Gardens, staged a stand of twenty-four incurved, which, considering the late date, were remarkably fine, being large, full and smooth. There were a splendid half dozen of Mrs. Robinson King. Miss Haggas was also exceptionally fine. Mr. Blair also had a grand box of twenty-four Japanese, in which Lilian Bird, Mons. Carrière and Mrs. Clarke were admirably represented together with many others (silver Banksian medal). Mr. Robt. Owen had a large collection of new and choice varieties. Viscountess Hambledon a white or blush Japanese, was very fine in petal. Peter Blair is a narrow floretted Japanese with petals of a peculiar old gold hue. Robt. Owen is a large yellow incurved with broad florets. Waban is a large blush Japanese with a rosy carmine wire to the florets. Several of these received awards and are described below. A silver Flora medal was awarded for the collection.

Messrs. Cannell & Sons had a number of their Cyclamens, the strains being noteworthy for free blooming and splendid flowers. It is hardly necessary to say that the plants were well grown (silver Banksian medal). Messrs. G. Paul & Son, The Old Nurseries, Cheshunt, had a most seasonable exhibit in the form of a group of berried and foliage plants, such as Pernettyas, various Hollies, Aucubas, *Hedera helix palmata*, and others; also *Azalca mollis* in bloom. These were remarkable in consideration of the early date of their blooming. They had been grown at High Beech, and were exhibited to show the adaptability of the plant for very early forcing, which fact they proved in a striking manner (silver Flora medal). Mr. H. B. May contributed a group of well grown, clean, and healthy Crotons of table size (silver Flora medal). Messrs. Veitch and Sons exhibited some new Japanese Camellias, which are referred to below; also the beautiful Begonia Winter Gem, a dwarf grower with brilliant rosy crimson flowers. Mr. T. S. Ware sent pans of *Corbularia Clusi* and pots of *Iris histrio*, both making beautiful objects. Messrs. Pitcher & Manda received a silver Banksian medal for a collection of Chrysanthemums, in which Lord Brooke and Mrs. Libby Allen were conspicuously fine. Mr. Wythes sent a group of decorative Chrysanthemums and also a basket of Hellebores.

ORCHID COMMITTEE.—Present: H. J. Veitch, Esq. (in the chair), Baron Schröder, Messrs. J. O'Brien, De B. Crawshay, T. W. Bond, C. J. Lucas, W. H. White, F. Sander, S. Courtauld, E. Hill, J. Jacques, A. H. Smee, H. M. Pollett, J. Douglas, T. B. Haywood, and Dr. Masters.

Mr. Wythes, Syon House Gardens, Brentford, sent a splendid group of *Cypripediums* and *Calanthes*, the plants being of the most vigorous and healthy character, with abundance of bloom. As coming from a private garden this collection was very noteworthy. Messrs. B. S. Williams & Son had a small, but interesting, group of Orchids, comprising *Odontoglossum Rossi albens*, *Cypripedium Pitcherianum* variety, *Calanthe Oweniana*, *C. Hookero-Veitchi*, and others. Messrs. Hugh Low and Co. had a small group, comprising *Cypripedium insigne Wallacei*, a good plant of *C. Leeanaum*, *C. nitens*, *C. Chamberlainianum*, *C. bellatulum*, *Vanda Amesiana*, and others. Sir Trevor Lawrence, Bart., Burford Lodge, Dorking, sent a pan of *Sophranitis grandiflora* full of bloom, *Dendrobium Burfordiense*, a hybrid between *D. Linawianum* and *D. heterocarpum*, *Laelia autumnalis atro-rubens*, *Masdevallia gargantua*, and a number of *Calanthes*, these comprising some delightful varieties, such as *versicolor*, *Burfordiense*, *bella*, *rose nivea*, and *Veitchi splendens* (silver Banksian medal). P. Crowley, Esq., sent *Angræcum pellucidum* with two spikes of its transparent yellow-tinted flowers. W. E. Ellis, Esq., sent *Dendrobium Phalænopsis Schröderianum*. Messrs. Pitcher and Manda were represented by a collection of *Cypripediums*, chiefly composed of varieties of *C. insigne*. Messrs. Sander & Co. had a group full of interest, comprising *Cypripedium Calypso*, *Oakwood* variety; *C. Johnsonianum* (see below); *C. Lathamianum*, Clark's variety; *C. Leeanaum*, Andenshaw variety; *C. Alcidis superbum*, *C. Leeanaum gemmatum*, *Laelia Gouldiana*, *Cattleya O'Brieniana*, *Laelia Oweniana*, *Odontoglossum Insleayi splendens*, *Dendrobium Cassiope*, *Cypripedium Chamberlainianum* and others. *Cypripedium insigne Sanderæ* was exhibited by Norman Cookson, Esq. It is a lovely form, the labellum and petals being of a clear pale yellow, the staminode deeper yellow, the dorsal sepal yellow veined with green and with a broad margin of white.

Mr. Bolton, Warrington, sent *Cypripedium Chamberlainianum giganteum*, and others. T. Statter, Esq., contributed several *Cypripediums* and *Laelia Gouldiana*. Mr. Brymer sent *Oncidium insculptum*, *Dendrobium Treacherianum* (botanical certificate), and *Laelia anceps Barkeri*. R. J. Measures, Esq., sent *Pleurothallis punctulata* (botanical certificate), and a number of *Cypripediums*. M. Wells, Esq., Broomfield, Sale, contributed *Cattleya labiata alba*, a beautiful white form (see below). W. Thompson, Esq., Stone, sent *Masdevallia hybrida McVittiae* (*tovarensis* × *Veitchi*) (see below). G. D. Owen, Esq., Rotherham, sent *Cattleya amethystoglossa*, *Selwood* variety, and *Laelia anceps Oweniana* (see below). Messrs. Veitch & Sons had a *Sophranitis* *Calypso* (see below), *Epiphranitis Veitchi*, and several *Cypripediums*. Arête received an award of merit (see below). C. E. Smith, Esq., Cobham, sent a grand plant of *Cypripedium insigne* 4 feet across, and carrying ninety-six blooms. (A silver Banksian medal was awarded). G. Lutwigh, Esq., received a bronze Banksian medal for some fine examples of the same Orchid.

CERTIFICATES AND AWARDS.

Chrysanthemum Mrs. Robinson King (Mr. Blair).—This yellow incurved has been described frequently, and needs no special comment (award of merit).

Chrysanthemum Enterprise (Mr. R. Owen).—A charming variety difficult to classify. It is neither a true large nor Japanese Anemone, but is likely to become popular for all that. The guard florets are soft rosy pink, the centre lemon (award of merit).

Chrysanthemum Viscountess Hambledon (Mr. R. Owen).—A Japanese with very broad, substantial, incurving florets, white, in one example also streaked with mauve (award of merit).

Chrysanthemum Waban (Mr. R. Owen).—A large Japanese with broad florets, white flushed with rose, and with a clear edging of rosy carmine (award of merit).

Chrysanthemum Robert Owen (Mr. Owen).—A large, deep, and massive incurved, rich deep yellow (award of merit).

Camellia Sasanque (Messrs. Veitch & Sons).—This is a single species from Japan with bright rose flowers, having prominent yellow stamens, and described as hardy. It is a beautiful species, and may prove valuable for hybridising (first-class certificate). A double white form was also shown.

Sophro-Cattleya Calypso (Messrs. Veitch & Sons).—This beautiful bigeneric hybrid is a cross between *Cattleya Loddigesi* and *Sophrontis grandiflora*, the former being the seed parent. It is a charming and richly coloured flower, the sepals and petals being rich rosy carmine, the throat buttery yellow, the lip deeply margined with rosy carmine. It is dwarf with lanceolate leaves (first-class certificate).

Cypripedium Arête (Messrs. Veitch & Sons).—This is a hybrid between *C. Spicerianum* and *C. concolor*, the former being the seed parent. It is a miniature form with marbled leaves and speckled flowers, the ground colour being white or greenish, speckled and streaked with rose (award of merit).

Chrysanthemum Mlle. Marie Recoura (Messrs. Cannell & Sons).—A large white Japanese with long slender florets, likely to turn out valuable for late use (award of merit).

Cypripedium Johnsonianum (Messrs. Sander & Co.).—This hybrid is a cross between *C. nitens magnificum* and *C. Lawrenceanum*. The lip petals are of burnished purple. The lower area of the dorsal sepal is deep green, the upper portion and edges pure white, lines of purple dots running through from top to bottom (award of merit).

Laelia Fincheniana (C. W. Finchen, Esq.).—A charming form with pure white sepals and petals. The prominent lip is white with a broad patch of magenta; the wings of the tube are white with magenta streaks (award of merit).

Cattleya labiata alba (M. Wells, Esq.).—A pure white form of *labiata* emanating from a portion of Messrs. Sanders' importation. It is absolutely pure white save for a lemon tinge in the throat, and extremely beautiful (first-class certificate).

Masdevallia hybrida MeVittie (W. Thompson, Esq.).—A hybrid between *tovarensis* and *Veitchi*, with bluntly lanceolate leaves and pale rosy-mauve flowers (award of merit).

Cattleya amethystoglossa, Selwood variety (E. D. Owen, Esq.).—A distinct and attractive winter flowering form, having long slender pseudo-bulbs, with a cluster of six flowers. The sepals and petals are cream coloured with a number of magenta blotches, the tip and the edge of the tube rich magenta (award of merit).

Laelia anceps Oweniana (E. D. Owen, Esq.).—A charming and richly coloured variety, with petals and sepals of a brilliant rose, paler at the base and with conspicuous white patches. The lip is rich magenta and the yellowish throat is streaked with the same colour (award of merit).

Chrysanthemum Fred Dorner (Messrs. Pearson & Sons).—A yellow Japanese, with deep globular flowers that will prove valuable for decorative purposes if free in blooming (award of merit).

NATIONAL ROSE SOCIETY.

ANNUAL MEETING.

THE sixteenth annual general meeting of the National Rose Society was held in the rooms of the Horticultural Club at the Hotel Windsor, Victoria Street, S.W., on Tuesday, December 13th. The Rev. W. Wilks, in the absence of the President of the Society, the Very Rev. the Dean of Rochester, occupied the chair, and there was a large attendance of members. The first important item on the agenda was the reading of the Report for closing year, and the financial statement, both of which are given below.

REPORT OF THE COMMITTEE FOR THE YEAR 1892.

In accordance with a resolution passed at the last annual general meeting of the Society, requiring amateur exhibitors to show according to the number of plants of exhibition varieties grown by them, the Committee drew up schedules early in the year in order to meet these altered requirements. The new system appears to have worked admirably, and greatly to the satisfaction of all classes of exhibitors. Indeed, the Committee are of opinion that in taking this important step, the Society has every reason to congratulate itself on being the first horticultural society in the kingdom to adopt any such complete and equitable arrangement for the benefit of its numerous amateur exhibitors. Several of the affiliated societies have already shown their approval of the new classification by framing their own schedules on similar lines, and it is to be hoped that another year other Rose societies may follow their example.

Three Exhibitions have again been held. That which took place at the Royal Horticultural Society's Exhibition Hall at Westminster, owing to the backwardness of the season, again proved a small one. On the other hand, the Crystal Palace Show was the largest which the Society has ever held, the number of blooms staged in competition, not including garden Roses, amounting to 7100. The provincial Exhibition held at Chester was also a remarkably fine and extensive one. Unfortunately, the Show day proved wet throughout, and consequently the attendance of visitors was very limited.

A sub-Committee has been appointed to prepare a new catalogue of exhibition and garden Roses, the old one being now somewhat out of date, having been issued in 1884. Several meetings have been already held by this Committee, and it is expected that the new catalogue will be ready for distribution to members during the course of the ensuing spring.

The position of the Society, as the leading authority on all matters connected with the Rose, is fully sustained, while there are at the present time more members and affiliated societies on the Society's books than at any previous period—viz., 527 members, and thirty-six affiliated societies.

FINANCIAL STATEMENT.

The Treasurer is again enabled to report favourably upon the Society's financial position. The income from all sources, including a balance of £40 0s. 11d. from last year, was £719 7s. 11d., while the total expenditure amounted to £687 11s. 4d., leaving £31 16s. 7d. to be carried forward to the next account.

T. B. HAYWOOD, Treasurer.

ARRANGEMENTS FOR 1893.

The Committee have made the following arrangements for the coming year:—An early Show of Tea and Noisette Roses will be held in conjunction with the Royal Horticultural Society at their Exhibition Hall at Westminster on Tuesday, June 20th, while the Metropolitan Exhibition will take place, as usual, at the Crystal Palace on Saturday, July 1st. Applications have been received from three different affiliated societies requesting the Society to hold the Provincial Show next year in their neighbourhood. After due consideration the Committee have decided to accept the application of the Workop Rose and Horticultural Society. Arrangements have accordingly been made to hold the Provincial or Northern Show in connection with that Society at Workop on Thursday, July 13th.

MEMBERS' PRIVILEGES.

Subscribers of £1 will, as in previous years, be entitled to two private view tickets for the Society's Exhibitions at the Crystal Palace and at Workop, and to four transferable tickets, admitting at the same time as the general public; while subscribers of 10s. are entitled to one private view and to two transferable tickets. Every member will also receive one ticket of admission to the early Exhibition of Tea Roses at Westminster. They will also be entitled to a copy of the Society's new descriptive catalogue of exhibition and garden Roses as soon as issued. Members joining the Society for the first time next year will also receive a copy of this new catalogue. Members alone are allowed to compete at the Society's Exhibitions.

The Committee desire, in conclusion, to convey their best thanks to the local Secretaries, upon whose exertions the welfare of a Society like this so much depends; and especially to Mr. C. J. Grahame, local Secretary for Croydon, who has again secured for the Society a large number of new members. To the donors of special prizes their thanks are also due, for donations of this kind are always extremely welcome, as they not only relieve the funds of the Society, but also often add very considerably to the interest of the exhibitions themselves. The Committee

have also to acknowledge the kindness and liberality of the Right Hon. Lord Penzance, who has not only presented the Society with a donation of £15 (a portion of which will be expended next year on a cup for garden Roses), but who has also promised to offer a 5-guinea cup for the same class of Roses in future years.

PROPOSITIONS AND ALTERATIONS OF BY-LAWS.

Following the reading of the report and financial statement, which were unanimously adopted, Mr. T. B. Haywood remarked that he wished to resign his position as Treasurer of the Society. This regrettable step he took for various reasons, amongst others being the difficulty of getting members to pay their subscriptions. The announcement, however, was received with so much regret by the meeting that ultimately Mr. Haywood promised to remain as Treasurer for one more year.

The Rev. J. H. Pemberton then proposed that the following words be added to Regulation 1:—"That the metropolitan Show shall be held on the Saturday nearest to the 6th of July." In putting forward this motion Mr. Pemberton said that he appealed, in the interest of northern growers, to the National Rose Society to consider the advisability of altering the date of their metropolitan Show. This must not be regarded as a northern show, but the representative show of the N.R.S., and it ought not to be held too early or too late. They ought to strike the happy medium. The Show this year was a grand Exhibition, but it was not a representative one. Many growers, a week before it took place, were afraid they would have no Roses. Many of the early districts—such as Croydon, Bath, Bagshot, and others—held their Shows after the National, which, to his mind, proved that the latter took place too soon. There were thirty-six affiliated societies, and only nine of these held their shows preceding that at the Crystal Palace. He had received letters from many well-known northern growers who were anxious that a later date should be decided upon. It was the opinion of many growers this year that their Roses were much better at a later date than the Show. Mr. Bateman supported the movement, and said that they had been losing sight of the fact that they were a National Rose Society. The past experience proved indisputably that for the "warm corners" the date of the Crystal Palace Show is suitable, but not for general districts. Mr. Grahame, on the other hand, said that the Crystal Palace Show of this year was one of the largest on record. There were sixteen counties represented at the Exhibition. It could hardly be said, therefore, that the date was too early. Rev. H. H. D'Ombraïn pointed out that the Amateurs' Challenge Trophy had been won twice each by northern and southern growers, and the same applied to the nurserymen. He thought it would be a pity to disturb a system that had worked so well. Mr. Mawley remarked that he had gone carefully into the matter, and as a National Show he thought as near to July 6th as possible would be a good date. The proposition, on being put to the meeting, however, was lost, the votes being 19 for and 26 against.

The Rev. J. H. Pemberton also made the following proposition:—"That the affairs of the Society be managed by one Committee, consisting of forty members (exclusive of the officers), to be annually elected by ballot at the general meeting of the Society, and that the by-laws and regulations be altered as suggested on the circular calling this meeting." This motion was seconded by Mr. Bunyard, and carried by a large majority.

The Rev. Foster Melliar proposed, "That at the general meeting all members be allowed to vote by proxy on matters of which due notice has been given." In moving this Mr. Foster Melliar pointed out the inconvenience to which it put country members, when attending the meetings for the purpose of voting. Mr. Grahame said he had long been in favour of members of the Society being allowed to vote by proxy. He thought country members should have a voice in the matter. The Rev. H. H. D'Ombraïn, however, was not in favour of a change. Other societies, that which their Chairman was connected with for instance, had important matters to carry out, but they did not think voting by proxy necessary. The proposition was, on being put to the meeting, lost by ten votes.

The Rev. F. Burnside, in regard to the selection of the medal blooms, made the following proposition:—"That in order to assist the Judges in the selection of the medal blooms, it be an instruction to the Judges of all the other classes to mark in some way, to be decided by the Committee, all blooms in the stands in their classes which in their opinion ought to be brought to the notice of the Judges for the medal blooms." The Rev. Foster-Melliar seconded this motion, which was carried by a majority of twenty.

The result of the ballot as to the election of the Committee was then announced. It was moved and carried, and Mr. Cranston's name be substituted for that of Mr. W. H. Fowler, whose official duties as Mayor of Taunton would prevent him attending the meetings.

A vote of thanks to the Chairman concluded the proceedings.

GRAPES AND TOMATOES AT HILL GROVE, KIDDERMINSTER.

DURING the past two or three years it has been my good fortune to inspect the Grapes growing at Hill Grove, Kidderminster, the residence of W. Hatton, Esq. The garden is not a large one, but Mr. Poole, the gardener, acts up to the principle of whatever is worth growing is worth growing well, be it flowers or fruit. He is also an old reader of the *Journal of Horticulture*, and anything pertaining to Vine culture

he takes the keenest interest in, and very pleasant chats have I had with him on this his favourite fruit.

A variety that he takes especial interest in is Mrs. Pince's Black Muscat, and he is of the opinion that when well grown and looked after that it is the best late black Grape in cultivation. The bunches are heavy and well shouldered, tapering well down to the point, and coloured splendidly. Another variety that he has been most successful with is Gros Maroc. It must not be inferred that I mean size of bunch, colour, and size of berry, as this is as good as the best of other people's, but in flavour. This, as is well known, is the shoal in many gardens in which it has been wrecked, but not so at Hill Grove. There it is grafted on the Madresfield Court. At the time when it first fruited there was only room for one rod in the place of two, and it was a question which should be sacrificed, the Madresfield Court or Gros Maroc, but it fell on the former. Mr. Poole says that the flavour is vastly improved by the union. Now many good gardeners are of the opinion that the stock does not influence the scion of any class of fruit as to alter the flavour for better or worse; but in this instance if the Madresfield Court has not influenced the scion for the better in flavour, what is it? If the majority of gardeners were asked what should be sacrificed in the above instance I am sure they would have answered off-hand, Gros Maroc. The experiment is well worth trying in other gardens. Gros Colman, Lady Downe's, and Black Hamburg are equally well grown.

I also noticed some good crops of Tomatoes produced on plants for supplying ripe fruits throughout the winter. The variety was a cross between the old Orangefield and Hathaway's Excelsior. It had the productiveness of the former with the size of the latter, it also being intermediate in character. The fruits were certainly not so smooth or round as one might wish, according to the present standard of an ideal Tomato, but they were weighty, and a good colour.—A. YOUNG.

HARDY FRUIT GARDEN.

Assistance for Fruit Trees.—The application of food, in the shape of natural or artificial manure, is necessary at times to the roots of most trees, in order to sustain them in a continuously fertile state. The present time of the year affords, perhaps, the best opportunity for supplying fertilising matter, as it also is for enabling the food thus supplied to have its virtues gradually washed into the ground, where they can combine with the soil constituents, ready to be available for the roots in spring. Active extension of root fibres then commences, and rich food in suitable quantity being ready to hand they multiply rapidly, to the benefit of the trees and crops.

When Trees Require Assistance.—Help is not absolutely needed every year by all trees. Judgment must be exercised in ascertaining their condition—not only at the present time, but for some months previous. Trees which have borne during the current season heavy crops of fruit will most likely be in the greatest need of manurial assistance. Applied now, it will help them considerably in strengthening their fruit buds, which may be weakly, owing to having had to compete for support with a large crop of fruit. Too heavily cropped trees often fail to fruit the next season, because their resources have been taxed to the uttermost in perfecting the crop. Such trees should not be too heavily manured, or they will be likely to run too much to wood, not having that balancing or restricting power which a reasonable crop of fruit gives. Old-established trees sometimes become barren, from the simple fact that the roots have long since exhausted the food supplies within their reach, and if the roots do not descend into the subsoil in search of that support they cannot find near the surface they will remain in a stationary condition, producing neither healthy wood growth nor sufficiently strong fruit buds to give good crops. Trees in the latter condition will be benefited by a dressing of manure, in either solid or liquid form. A sprinkling of bone dust and occasional doses of soot are also beneficial, especially on strong soils.

Advantages of Manuring.—The chief aim of the cultivator in enriching the soil with proper substances which experience has found to be best adapted for fruit is to maintain the trees in health, vigour, and fertility. Annual or biennial top-dressings encourage the production of roots near the surface, where they can more easily be fed and partake of the natural advantages of air and warmth. To obtain command of the roots, liberally feeding them with food and moisture as they require it, ensures, other conditions of culture being carried out well, regular and even crops of good fruit.

Best Kind of Manure.—As a general rule the best manure for the majority of fruit trees and bushes is that from the farmyard. It contains, if good, a large proportion of the necessary elements which fruit trees need, and will always be largely used. If possible, it should be neither quite fresh nor thoroughly decayed, but in that state in which its component parts are decomposed enough to be of use in supplying plant food, but not so decayed that the chief nutritive elements have escaped, leaving behind a heavy, soapy mass. In the latter case it is of little use. Fresh manure, on the other hand, is more beneficial, as it

contains much that has not had time to escape; therefore, when applied to the soil a proportion of its available constituents are secured.

Liquid Manure.—Where sewage tanks and cesspools exist their contents may be emptied on the ground in the fruit quarters, old-established orchard trees, large wall trees, and others of more than ordinary dimensions and age being the most benefited. Good results follow its application to smaller trees, but it must not be given to them so freely as to larger and older specimens. The roots of the former, being nearer the surface, may be equally well fed by mulching with good manure, reserving the liquid for larger trees which have impoverished the soil.

Applying Manure.—The conveyance of solid manure to handy positions in the fruit quarters is best done in frosty weather. Much of it may be laid in small heaps ready for spreading when dry mild weather prevails, or a slight frost just hardens the ground. Spread the manure 4 inches thick over the roots as far as the branches extend outwards. Wall trees may have it spread over the border 4 to 6 feet wide according to the height of the trees. Cordon trees on walls, espaliers, and borders will have root extension confined within narrower limits, which it is desirable to encourage, therefore confine the mulching to 3 feet wide. Bush fruits may, as a rule, have a heavy mulching, covering the ground between the rows as well as over the roots with manure, this being applicable to Gooseberries, Currants, Raspberries, and Strawberries in quarters, lines, clumps, and beds. When not planted too closely together there is usually some amount of space between Gooseberry and Currant bushes not occupied with roots. This affords an opportunity for burying the surface soil immediately under the trees, which often contains pupæ of caterpillars, from which again winged insects emerge next season. Therefore, where attacks of caterpillars have been prevalent remove the soil referred to, burying it deeply, accompanied with a dressing of lime. The space over the roots, many of which will be exposed by the process, fill up with manure, or loam and manure. Avoid spade digging between Raspberries and Strawberries, which are generally so well furnished with fibrous roots that any disturbance of the soil results in injury or destruction. The annual surface dressings of manure contribute the best to their maintenance and support with the most prolific results.

Applying Compost.—Unless the soil near the surface is well occupied with roots, it is advisable with wall trees to remove some of the inert and impoverished surface material down to the roots, replacing it with some fresh, sweet mixture consisting mainly of loamy and turfy soil intermixed with burnt refuse, soot, pulverised lime rubbish, a little half-decayed manure. If the soil be of a heavy nature some gritty material from the roadsides will also tend to lighten it. This compost coming directly in contact with the roots will soon accelerate the production and ramification of fresh fibres. The trees relish encouragement of this kind, and soon show it in the improved condition of growth and the perfection of better flavoured fruit.

FRUIT FORCING.

Vines.—*Earliest House.*—When the eyes break, the temperature will need to be increased to 60° at night in mild weather, and 55° when severe, gradually increasing it so as to have it 60° at night when the Vines are in leaf, and from 65° to 75° by day, with moderate ventilation. Sprinkle the floors and surfaces of borders twice or three times a day in clear weather, avoiding a too damp or too dry an atmosphere. To Vines in pots liquid manure should be given at the temperature of the house. Disbudding must not be practised until the bunches show in the points of the shoots.

House to Afford Fruit in May.—The house for this purpose should be started without delay. A bed of leaves and stable litter placed on the floor of the house, turning a portion of it daily, so as to supply ammonia to the atmosphere, is saving of fuel, and conduces to a good break. Outside borders must have the needful protection from cold rains and snow; a few inches thickness of dry leaves and a little litter over them answer when the Vines are planted inside, but where the border is all outside a covering of warm litter is preferable, two-thirds of leaves to one of stable litter affording a less violent but more lasting heat than manure alone, adding fresh material as necessary. The inside borders may be rendered thoroughly moist by applying water, or in the case of weakly Vines liquid manure, at 80°. Start with a night temperature of 50° in severe weather, 55° in mild weather, and 65° by day, except the weather be cold, when 55° will be more suitable. This slow work is better than a high forcing heat, which induces a weak growth; and we do not advise those temperatures to be exceeded until the growth commences. Depress young canes to the horizontal line or below to insure the regular bearing of the buds. Maintain a moist atmosphere by syringing occasionally, but avoid excessive moisture, and keeping the rods dripping wet, which excites the production of aerial roots from the rods.

Midseason Houses.—The Vines should be pruned and at rest; if not complete the work, and cleanse the houses without delay. Where the Grapes are partially cut the remainder may be removed with a good portion of wood attached, and if the stems are inserted in bottles of water the bunches will keep admirably in a dry room from which frost is excluded. Thus the Vines will be liberated for pruning and the house for cleansing, repairs, and painting. A long and complete rest invigorates Vines, and early pruning effects that better than anything else.

Late Houses.—Vines that have the foliage all off will only require sufficient fire heat to exclude frost, but Muscats require a temperature of 50°. Black Hamburgs, however, shrivel in that heat, 40° to 50° being sufficient for them and thick-skinned Grapes.

Pines.—*Young Stock.*—Keeping these plants too close and warm causes them to become drawn and weakly. At night 60° should not be exceeded, but a mean between that and 55° secured at night, which, with 65° in the daytime, will keep young stock gently moving, admitting a little air at the top of the house at 65°, leaving it on all day, but do not let the temperature fall below that point, and when the sun raises the temperature to 75° a free circulation of air should be allowed. The bottom heat must be kept steady at 80°. Avoid a very damp atmosphere, moderate humidity will suffice. Apply water only when the plants become dry, and then give weak liquid manure in a tepid state. Allow the plants plenty of room, and keep them as near the glass as is safe.

Plants for Affording Fruit in May and June.—Where a supply of ripe fruit is required in May and June, and plants are not showing fruit, it will be desirable to select from those started last March, which have completed a stout growth and are now in a state of rest, such as show the best indications of starting into fruit when subjected to a higher temperature both at the roots and in the atmosphere. If the plants cannot have a structure to themselves they should have a light position in the house where the fruifers are swelling. In the fruiting department 65° will be ample at night, 5° lower in the morning in cold weather, and 70° to 75° by day.

Strawberries in Pots.—When the crowns commence swelling and the trusses appear the temperature may be advanced a few degrees by day, but 50° to 55° is sufficiently high at night. Syringe the plants lightly in the early part of fine afternoons. Examine them daily and supply water to all that require it. Keep a sharp look out for aphides, and if any appear fumigate the house on two consecutive evenings. It is very important that the plants be perfectly clean, and fumigation must not be practised when they are in flower. Another batch of plants should be placed in a house from which frost is excluded, removing the decayed leaves, and the surface soil should be loosened and a top-dressing supplied, a little bonemeal being excellent. Attend to the drainage; if defective rectify it, and wash the pots. The plants may be introduced during the next three weeks to a Peach house or Strawberry house. John Ruskin, La Grosse Sucrée, Vicomtesse Hericart de Thury, and Noble are suitable varieties. Plants for starting later will be quite safe in their quarters outdoors plunged in ashes to the rim of the pots, and a light covering of dry fern or litter may be given in severe weather, removing it when the weather is mild. If the plants are placed in frames the lights should be drawn off in mild weather, but in mild wet weather the lights should be tilted. The plants cannot be kept too cool, and none should be allowed to suffer through want of water.

Cherry House.—Houses that are to be employed for supplying ripe Cherries from the middle of April and onwards must now be closed. Be sparing of fire heat at the commencement, not employing it unless absolutely necessary to maintain the temperature at from 35° to 40° at night, and 40° to 45° by day, ventilating when the temperature is about 50° to 55°. Close the house when the temperature is at 50°. Syringe the trees and available surfaces early on fine afternoons, so as to admit of the buds becoming dry before nightfall. The border will be sufficiently moist for some time through the removal of the roof lights, if not it must have water to bring it into a thoroughly moist state. Trees in pots if at all dry will require repeated supplies of water to secure the thorough moistening of the soil to the base of the pots.

THE FLOWER GARDEN.

Summer Bedding Plants.—A mild winter is not always the best as far as keeping tender bedding plants is concerned. Damp is very destructive among Zonal Pelargoniums especially, and these ought, therefore, to be kept rather dry at the roots, and all decaying leaves picked off whenever seen. They keep best in a house where a little fire heat is maintained and the top ventilators open during the daytime. Give shrubby Calceolarias, Violas, Pentstemons, Antirrhinums, and Carnations in frames abundance of air with a view to checking premature growth, and protect well from severe frosts. It is a great mistake to subject any of them to fire heat. Carnations ought to be raised well up to the glass in pits or frames, have all dead leaves picked off, and be fumigated occasionally if green fly is seen on them. Bedding Lobelias also object to much fire heat, and should never be very dry at the roots, otherwise the growths harden and flower early, whereas the young shoots to be propagated should be succulent and fresh. A warm greenhouse suits Heliotropes and Ageratums, and only old plants of the former should be kept somewhat dry at the roots. Such heat-loving plants as Iresines, Coleuses, and Alternantheras winter most surely on shelves in plant stoves and forcing houses, receiving only enough water to keep them fresh in appearance.

Transplanting Bulbs.—Mild, fine weather in November has been most favourable for lifting, dividing, and transplanting established clumps of various bulbs, but it is not yet too late to divide and replant clumps that are either becoming crowded or present a sickly appearance. Clumps of Snowdrops growing wild can now be shifted to the flower garden or borders, taking care to replant as deeply as they were previously buried, the latter remark also applying to transplanted bulbs generally. Daffodils and Narcissi in particular are liable to be badly splashed by heavy rains when in flower, but a mulching of leaf soil, given now, would prevent this and otherwise act beneficially. Mild weather is the best time to lift and replant bulbs, and also for loosening the soil among those not lifted, prior to mulching with leaf mould.

Border Chrysanthemums.—The season has been a good one, both for the summer and autumn flowering varieties. Strong young plants give the best results, and if there are no stock plants in pots of the best

border varieties, some of each ought to be lifted, potted, and stored in cold pits or frames. Cuttings in the least frosted damp off, whereas those from plants that have been protected from severe frosts strike readily in February or March. Summer and early autumn flowering varieties, of which there are plenty to select from, are much the best for open borders and for growing against walls, planting out surplus plants of the majority of Japanese and large flowering forms that succeed well under glass being so much wasted labour and space.

Protecting Roses.—It is scarcely possible to protect standard Roses effectively, but there is no difficulty with dwarfs, and they may need protection badly before midwinter. At present they are in a very sappy state through the long-continued mild weather, and therefore ill prepared for a trying ordeal. Straw litter or bracken placed round the stems to a short distance above where they ought to be pruned next spring will save them, as will ashes or cocoa-nut fibre refuse mounded up well over the lower parts. If Tea Roses are brought in before March it is advisable to defer planting and lay them in separately by their heels in good fine soil, where they can easily be protected from severe frost.

THE BEE-KEEPER.

APIARIAN NOTES.

THE WEATHER.

SINCE the 1st of December the weather in Lanarkshire has been of a wintry nature, deep snow, and a low temperature prevailing. On the 2nd the thermometer registered 9°, but on all other mornings since the frost commenced it was never lower than 19° and never higher than 21°, the day temperature ranging from 25° to 28°, very much like the same month in 1853.

THE APIARY.

At the present time the apiary gives me no concern. All the stocks are well supplied with food to last till April or May, are thoroughly protected from rain or internal damp, and proof against frost many degrees below zero. They will be let alone until the snow disappears. Notwithstanding the low temperature, I have observed bees flying about and returning safely to their hives. The greatest number of dead bees I have observed outside are five, and none whatever upon the floor of the hive. Preparing sections at this time of the year for another season has its advantages, but unless stored in a dry and high temperature and hermetically sealed, the comb foundation is liable to fall away, so that it is perhaps better to postpone the work till further on in the season.

It is to be regretted that foul brood in many places is still rampant amidst all the eloquent boasting of an advanced and enlightened Association. An entire riddance of it may be effected by adopting the "purgatorial" cure, which as yet with intelligent people has never failed. The changeability of appliances.—This is a great means of spreading foul brood when once it has established itself in the apiary through mismanagement. Unless the bee-keeper is perfectly sure no foul brood exists amongst his hives he should be careful not to change any parts or appliances from one to another. I believe feeders are means of spreading foul brood. Everything in or about the hive should be numbered, including feeders, and there should be one to every hive.

BREEDING.

This will begin in many hives having young queens by the end of the month. Old queens will not begin till rather late in the spring, consequently when their hives are in a comfortable state the bees are less likely to fly out than those having young queens; but the latter raise the temperature of their hives more than non-breeding ones, hence are better able to resist an inclement day should they venture out. The moral to be observed is never to make the slightest alteration of site, covering, or width of entrance from the time the hives are finished up in September or October until the spring.

FOUNDATION.

Procure this and all supers and frames fitted with it during winter. A word of caution as to its use. Many bee-keepers fill sections and supers with it, which gives a greater quantity of honey, but of inferior quality. Those who go in for quantity use full sheets, and have to be contented with a lesser price, while those who go in for quality can easily dispose of it, in the face of a glutted market too, and at a higher figure. The latter are those who are really creating a desire for honey amongst the million, which will result in more profit. The former may be causing more sensation, but are shutting the door against future profits.—A. L. K. B.

TRADE CATALOGUE RECEIVED.

James Carter & Co., High Holborn, London.—*Vade Mecum and Seed Catalogue.*

*All correspondence should be directed either to "THE EDITOR" or to "THE PUBLISHER." Letters addressed to Dr. Hogg or members of the staff often remain unopened unavoidably. We request that no one will write privately to any of our correspondents, as doing so subjects them to unjustifiable trouble and expense.

Correspondents should not mix up on the same sheet questions relating to Gardening and those on Bee subjects, and should never send more than two or three questions at once. All articles intended for insertion should be written on one side of the paper only. We cannot reply to questions through the post, and we do not undertake to return rejected communications.

Primulas (B. C.).—The white Primulas are very good indeed, the coloured flowers good, but we have seen many better. We suspect the plants have been very well grown.

Photograph (D. Buchanan).—The photograph of Vine leaves and Tomatoes is very good indeed. The exhibit of the brilliant leaves and fruits at Edinburgh must have been both novel and attractive, the special award and certificate being evidence of this. Reporters usually accidentally omit some exhibits at large shows, and they are not infrequently restricted to space, therefore do the best they can under the circumstances.

Vine Leaves Falling (F. J.).—There is nothing wrong in the leaves falling a few days before the footstalks, but it indicates activity at the roots, and the gradual or slow ripening of the foliage. It is most pronounced in Black Hamburg Vines, and is a good rather than a bad sign. We advise you to admit aid freely, and keep the house as dry as you can so as to assist the foliage in maturing by aiding the evaporation of moisture from that remaining, and it will materially benefit the wood. Vines that carry 1 lb. of Grapes per square foot of roof are not in bad condition.

Cutting Box Edging (F. J.).—It is not desirable to cut Box edging during the winter months, as there is then danger of damage by frosts. Even when the Box is cut during mild weather at this time of year, and frosts occur afterwards, serious injury accrues. If only slightly cut in the edging assumes a very unsightly appearance; if cut hard back the sprays die down considerably and the edging becomes irregular and gappy. We have not found any better time than mild showery weather after the middle of April to clip Box edgings when they need a fair amount of cutting back, or if merely trimming is needed it is best done in June.

The Cobham Apple (H. J. II.).—Your letter addressed to Mr. Kirk, nurseryman, Brompton, Kent, was not likely to find the Mr. Kirke who obtained grafts of Pope's Apple, raised trees for sale, and named the variety Cobham, for he died many years ago, and the South Kensington Museum and other buildings are erected on the site of the old Brompton Nursery referred to. It is impossible that we can do anything so invidious as to recommend particular nurserymen from whom to obtain fruit trees. Those who may have trees of the true Cobham Apple would have no difficulty of disposing of them if they wished to do so by advertising. This variety bears much sooner than does the good but tardy old Blenheim Pippin, and so does the Beauty of Hants. All are good Apples.

Houses for the Early Muscat Grape (Elstree).—We presume by Muscat that you mean the Muscat of Alexandria, which is not an early Grape, and cannot be forced so as to become perfect in colour and finish before the middle of June, and then it has formidable competitors in Madresfield Court, which has a "smack" of Muscat, and other early and fine-looking Grapes. Muscat of Alexandria, if well grown and finished (not otherwise) always commands good prices early in the season, and is profitable. Well kept late Muscat of Alexandria and Canon Hall Muscat bring the highest prices, and are highly profitable, but the difficulty is to keep them in good condition to a late period. Lean-to, or preferably three-quarter span-roofed houses, are the best for early forcing, and they must be efficiently heated.

The Chrysanthemum Leaf-mining Insect (G. O.).—The "maggots that form tunnels in Chrysanthemum leaves" are produced in the same way that the maggots are in the leaves of Celery. The name of the Chrysanthemum enemy is *Tryptera artemisiae*, which punctures the leaves, depositing eggs in them, these hatching into maggots that feed on the parenchyma of the leaves. This, or an allied insect, is exceedingly destructive to the larger-leaved forms of the white Marguerites—such as Chrysanthemum Halleri, the smaller-leaved C. fruticosum being also attacked, but less persistently. We know of a gardener who insures his Celery against the attacks of the fly by syringing the plants once a week in the summer with a weak solution of petroleum, which he says does the plants good, while the Celery fly will have nothing to do with them.

Marechal Niel Rose Under Glass (S. S.).—The cause of the buds pushing "blind" or flowerless shoots, instead of breaking into flowers in April and May, is immaturity of the wood and buds, and it is somewhat late now to effect the transformation of the wood into flower buds. A sudden check would do it most effectually, such as root-pruning; but that is a dangerous expedient to practise on Rose trees that cover large areas, and is only advised in moderation and with great care, for if done excessively, though the plants may give a large crop of flowers, they are generally so exhausted as to make little growth afterwards. We advise the removal of the soft growths to wood becoming somewhat ripe, and giving all the light and air possible, but excluding frost. Withhold water from the roots, but do not allow the soil to become so dry as to cause the soft wood to shrivel.

Vines with Loose Bunches (Amateur).—When the bunches are unsatisfactory pruned on the close or spur system there is necessity for change, and you could not do better than prune to the best bud—the "round and plump" at the third or fourth joint, in preference to those at the base, which are "small and pointed." As to the looseness of the bunches, that depends in a great measure upon the vigour of the Vines and ripeness of the wood. With the wood well ripened compactness of bunch may be relied on from all the eyes or buds, and sometimes gross Vines will give loose bunches from the base buds; but such are rare as compared with bunches from eyes further from the base, which are not only very much larger but correspondingly looser, and usually have more seedless berries. The chief points to bear in mind are to prune to the best buds only where the wood is ripe, not where it is immature; and to pay especial attention to disbudding in the spring to prevent overcrowding of the growths and foliage in the summer.

Pruning Roses when Planting (J. S.).—We should not hesitate to shorten the very long growth, reducing them about half, though we know they are often left uncut till spring, and Roses thus left unpruned, say till April, have grown very well, though we have also known some to fail. The difference may be attributable to the weather. Should the air be very dry over a long period, as it often is in February or March, when easterly winds prevail, the longer the shoots are the greater the evaporating surfaces, and consequently the greater the escape of the juices from the plants, at a time when the roots are inactive, and cannot absorb moisture from the soil to compensate for the loss. When Roses are dug up and planted in October and November they may commence rooting at once, and can then imbibe moisture to meet the demands of evaporation; but when planted now, and onwards, we suspect the roots remain dormant till the spring, and on this account we should shorten the branches as the safest course to adopt in conserving the moisture in the lower part of the stems. If a Rose tree is dug up in October, before the leaves fall, the moisture escapes from them, and the stems shrivel, but if most of the leaves are cut off the evaporating surface is reduced, and the stems remain fresh. But, observe, we should only "half prune" now, shortening more closely in spring after the buds push from near the tops of the shoots, and if they grow an inch or more no harm is done by their removal.

Forming a Bed of Lily of the Valley (S. F.).—Select a piece of good ground in a border, with a west aspect preferably, or an east border will do. Trench the ground, keeping the good soil on the top, and mix a dressing of decayed manure—say 3 inches thickness—with the top foot of the soil. Planting should be performed just before growth commences in spring, and the crowns placed together in their sizes, say three: 1, the largest; 2, the medium; 3, the smallest. If the soil is light, firm it well before planting, similar to an Onion bed, by treading, and have the surface fine and even. In planting a shallow trench should be cut out, the crowns placed upright in it, about 2 inches apart, so that their points are just below the surface, which ought to be smooth and fine. Cut out the next trench 9 inches from the first, and plant it in a similar manner, and so proceed, leaving out every sixth row, so that the plants will be in beds with an alley between them. The large crowns will flower the soonest, the medium the next, and the weakest the last, but all will produce good flowers after one or two years' growth if well treated. Keep the surface free from weeds, water well in dry weather from the commencement of growth until the leaves decay, and mulch with about an inch of partially decayed manure before dry weather sets in, say early in June. You mention clumps. If you desire to lift them for forcing, plant about a dozen crowns in a bunch about 4 inches in diameter, 9 inches asunder, and allow 1 foot between the rows of clumps, leaving out every fifth row, so that they will be in beds, and the alleys render cultural operations more easy. The large crowns in this case will, or ought to, form flowering crowns the first year; the second size should also form good crowns the first year, and be available for lifting in autumn, yet they are better two years old; but the smaller crowns will take two years to become strong enough for lifting, potting, and forcing.

Planting Violets (C. H.).—The most suitable plants are those taken from outdoor-grown stools. The old stools or plants should be taken up after flowering, or at the close of April or early in May. It will be found that there are plants of two descriptions—viz., runners of last year with more or less roots, and suckers that emanate from the stem of the plant, some, if not all, of which have roots of their own. These two kinds are suitable for immediate planting after being detached or separated from the parent. They should have the runner wire and any large old leaves removed in trimming prior to planting, which will increase the length of the stem of the runner and facilitate the operation, and suckers should be treated similarly in respect of the

old leaves; but in each case all the fresh, green, healthy leaves should be carefully preserved, and any straggling or long root stem of the sucker shortened, preserving, however, a good amount of roots to each. Runners are best; the suckers, however, are good, but it is perhaps best to keep each separate—i.e., plant the runners and suckers separately. In any case they must be kept as much out of the sun as possible until planted, it being a good plan to lay them as prepared in wet moss up to the collar. Plant the large-leaved or stronger-growing varieties 1 foot apart every way, whether the plants are put three or seven in a group, in threes or sevens, the circles being respectively 1 foot, 2 feet, and 3 feet across, and the arrangement equi-distant. The dwarfier varieties will be accommodated with a distance of 9 inches between the plants. The ground should be made firm by treading when the weather is dry. Choose moist weather if possible for planting, and place the plant so as to leave the centre clear of the soil after it is pressed down about the roots as it should be rather firmly, or as firm as the surrounding ground. Water at once, and through a rose, so as to settle the soil about the roots, which should be repeated each evening until the plants become established, to facilitate which a few branches of evergreens or twigs of deciduous trees in leaf stuck in the ground on the sun side, so as to shade the plants, will be well repaid in the after well-doing of the plants. Keep a sharp look out for slugs late in the evening and early morning, after or before rain. Dust the plants with quicklime late in the evening, which will destroy all it falls upon, and repeat as occasion requires. As a preventive a ring of dry soot may be drawn around each plant.

Names of Plants.—We only undertake to name species of plants, not varieties that have originated from seed and termed florists' flowers. Flowering specimens are necessary of flowering plants, and Fern fronds should bear spores. Specimens should arrive in a fresh state in firm boxes. Slightly damp moss, soft green grass or leaves form the best packing, dry wool the worst. Not more than six specimens can be named at once, and the numbers should be visible without untying the ligatures, it being often difficult to separate them when the paper is damp. (F. F.).—1, *Lavendula dentata*; 2, *Pilea muscosa*; 3, *Tradescantia multicolor*; 4, *Francoa ramosa*; 5, *Imantophyllum (Clivia) miniatum*; 6, *Lachenalia*, species not determinable without flowers.

COVENT GARDEN MARKET.—DECEMBER 14TH.

Trade slow, good supplies with no alteration in prices.

THE AGRICULTURAL CONFERENCE.

A GREAT representative meeting of agriculturists has been held in London; protection, fair trade, bi-metallism, burdens on the land, and rent reduction have all been discussed, with a total result that the attention of the country has been thoroughly aroused to the deplorable condition of agriculture. That is the sum of the whole thing so far; any practical result is indeed a doubtful matter. It should never be forgotten that many members of the legislature are themselves great landowners, who have already made considerable reductions of rent, amounting in numerous instances to fully 50 per cent. of their income; it is certain, therefore, that they would gladly welcome a measure for relief; more than this, if they for one moment regarded such a step as possible would not they have taken it in their own interests without waiting to be urged to do so by a public meeting? Nobly have they borne their share of the burden, so quietly and uncomplainingly, that it is probably supposed they will submit to a still further reduction, but as Lord Leicester said recently, when publishing the accounts of the Holkham estates, "landlords will not bear much more squeezing." He, at any rate, can show how landowners do their duty, not only by rent reductions but also by persistent estate improvements, the joint amount expended by himself and his father, the late Lord Leicester, amounting to the enormous sum of £1,095,148.

If the land is unfairly burdened by imperial and local taxation it ought certainly to have relief, as it will if landowners, tenant farmers, and labourers combine to demand it. But will they? It is a matter of notoriety how very many farmers have allowed themselves to be fleeced under Schedule B year after year by numerous tax gatherers, or rather surveyors of taxes, who do their utmost to wrest income tax from all and sundry. This is one weak point; another is the general want of business capacity in the sale of farm produce. How can the rising generation of farmers acquire this capacity or become skilful judges of the value of live stock under the present universal system of market sales by auction? The leading auctioneers' profits amount to hundreds of pounds on a single market day, as anyone may see who goes to their office after the sales are over and payment is going on. The commission charged may be what is termed fair if the test of a general rate is applied to it, but it is nevertheless a tax upon the producer which ought to be avoided.

As an example of the advantage of doing so, a correspondent of the *Standard* says:—"Much has appeared at various times as to agricultural depression, and the low price at which farmers are obliged to sell their stock, both fat and store. All this time there has been no reduction in the prices charged by the butchers, and therefore the consumer in no way benefits by the present low prices. By way of testing what the butcher is at present making, I bought nine fat sheep at one of the auction marts for £11 5s. Each sheep, therefore, cost me 25s. on the average. They were a mixed lot, some pure Cheviot wethers, some half-bred—i.e., by Leicester tup out of Cheviot ewes, and some grey-faced—i.e., by Leicester tup out of black-faced ewes. They were all one-year sheep—i.e., last year's lambs, in capital condition and first-rate quality, and the weights averaged from 46 lbs. to 54 lbs. I sold the hindquarters at 7d. per lb., and the forequarters at 6d., or an average of 6½d. per lb., the purchasers themselves taking away the meat. The lightest weight sheep left me 24s. 11d. for the carcase, 1s. for the head and pluck, and

3s. 3d. for the skin. The heaviest left me 29s. 3d. for the carcase, 1s. for the head and pluck, and 3s. 3d. for the skin. Each sheep also left an average of 6d. for the internal fat. The result is an average profit of 6s. 8½d. per sheep." Now one of the farmer's pet grievances this year has been the low prices of sheep, yet all the while the butcher has made £6 or £8 profit on every score of sheep he has purchased at market auctions. Good for the butcher, but very bad for the simple, easy-going farmer. Why do not farmers combine, and have at least one good butcher's shop, or half a dozen shops for the matter of that, in every market town? The butchers might combine to undersell them, but that is a game at which the farmers would certainly win.

In the sale of Wheat as flour or bread there would be more difficulty, both because so much home-grown Wheat goes into market wet, and that foreign flour is so accessible to the baker. Like the butcher, the baker thrives apace; no fall in the price of Wheat affects the cost of bread. Bakers combine to keep up the price, and consumers are ruled by their caprice. The 4-lb. loaf is now 7d. at Hampstead, 6½d. at Kingston-on-Thames, 4½d. at Shrewsbury, 6d. in Birmingham, and from 3½d. to 5½d. in Wolverhampton, the price of Wheat being very much alike at all those places.

WORK ON THE HOME FARM.

Frost, snow, and rain were all in evidence during the past week, which closed with a severe frost generally, very little snow being visible in the southern counties, but snow was still more or less deep in the Midlands. Out on the moors of Derbyshire the snow was so deep and had drifted so much that considerable difficulty was experienced in bringing home to the homestead a lot of young horse stock and store cattle. It was time, for though the animals were in fair condition, exposure and short commons told so severely that the drovers were overtaken by darkness while still a long distance from the home farm, and the hungry cattle had to be driven into an enclosure near a wayside inn. We mention this fact as a reminder of the folly of such exposure. The excuse was a short supply of hay at the home farm.

All possible care should now be given to afford shelter and warmth to all live stock. Ewes due to lamb in January should not be out in a bleak, wind-swept pasture, but should either have the advantage of shelter from tree belts, or be driven at night to the lambing yard, where they are well fed. We have racks out on the pasture which are now kept well filled with pea straw; the ewes have also a pint of oats per head daily, as well as some chaff in the troughs. They are under close supervision now, and the shepherd must be on the alert to prevent fright from stray dogs or foxhounds, to assist any cast sheep—i.e., ewes which have rolled over upon their back and are unable to get up. If left in that position they are soon dead, but losses are rare from this cause under good management.

Dairy cows are now having a full supply of the best meadow hay, with crushed Oats, meal, and Carrots. Neither store cattle or sheep have any hay, chaffed Oat and Barley straw, with silage and some roots being used for the cattle freely. Valuable as some arable land always is on a dairy farm, it is especially so during winter, when the corn, root, and fodder crops obtained from it enable us to avoid using hay, except for the cows. It is on farms where there is nothing but hay for winter—no straw, roots, or home-grown corn—that a long hard winter is so trying.

REMARKS.

- 4th.—Almost cloudless throughout, with cold wind. [in evening.
 5th.—Unbroken sunshine in morning, occasionally cloudy in afternoon; a little snow
 6th.—Occasional sprinkles of snow early, and a heavy fall in large flakes from 11.10 to 11.30 A.M.; bright sun between and in afternoon; a little rain, or very wet snow, at 9 P.M.
 7th.—Fine and generally sunny.
 8th.—Sun shining through thin cirrus cloud nearly all day.
 9th.—Rain from 2 A.M. to 7 A.M.; bright, sunny day, with occasional cloud.
 10th.—Almost cloudless morning; generally sunny in afternoon; snow shower at 8.15 P.M.
 A generally fine week, and much colder, though no frosts which could be called intense.—G. J. SYMONS.

AS a centre for the disposal of garden produce Covent Garden is unquestionably one of the finest markets in the world. Apart from its historical connection, which is of no mean interest, there is a certain charm about the place if only regarded as a great *dépôt* for fruit, flowers, vegetables, and evergreens. To the ordinary sightseer there may appear to be a sameness about the market at all periods of the year, but to a keen observer matters are entirely different. As the seasons change, so does the produce in Covent Garden Market. There is always something fresh to be seen; there is ever a lesson to be learnt. Day after day, week by week, and year by year there is, it is true, the same busy scene, and at no time is the market more attractive, or its *habitués* more active, than during the week preceding Christmas. The demands for fruit, flowers, and other produce naturally increase considerably just prior to the festive season, and to meet the requirements of the millions of consumers in the metropolis the producers must necessarily increase their consignments accordingly. This year is no exception to the rule, and a visit to the market early on Tuesday morning, long before the sun had risen, proved both interesting and instructive.

At an early hour the flower market first commands attention, for at no other time can this be seen. Scarcely have the numerous residents of the metropolis gone to rest when the flower market men commence to be busy. This goes on two or three mornings a week, and from as early as three o'clock till seven the scene is of the liveliest nature. Men and youths, women and girls, are making, or trying to make, bargains, and thousands of pot plants and innumerable boxes of cut blooms change hands in a very short time. By eight o'clock the most important of the business is over, and the majority of buyers have departed from this great floral emporium, which at 9 A.M. is closed for the day. It is impossible for those who have never seen it to form an adequate idea as to its magnitude. It is one of the best and most interesting sights of London, and yet, apart from those whose business it is to be there, comparatively few people have ever seen it. Imagine a vast hall filled to overflowing with banks of flowering and foliage plants all in the pink of condition, and myriads of cut blooms arranged so as to be seen to the best advantage, and even then one can only form a poor idea as to the splendour of this floral scene. Palms, neat in habit and of fresh appearance, are sold in thousands, and the same may be said of *Dracenas*, *Ficus elastica*, Ferns in variety, and other foliaged plants. Of flowering plants there are Primulas, Arums, Ericas, Lily of the Valley, Cyclamens, White Marguerites, Hyacinths, and Tulips, the majority of the latter being in shallow boxes. Poinsettias, too, are well represented, and show up splendidly amongst the light coloured flowers. And what plants they are! Not the long straggling leafless specimens that are too frequently seen in private gardens, but dwarf and sturdy, seldom exceeding 18 inches in height, and carrying brilliant heads at least a foot in diameter. The red-berried *Solanum capsicastrum* is a great favourite in the market just now, and may be seen in immense numbers and splendid condition.

Cut flowers are also represented in bulk. Although late, Chrysanthemums were fairly numerous, the white and yellow and bronze coloured varieties being the most plentiful. These, of course, are from home growers, but not so the neat boxes of Tea Roses and

Narcissi, that are so conspicuous in the flower market. These, or the bulk of them, come from sunnier climes than ours, and find a ready sale here. They are carefully packed, and in most cases are as fresh as if just cut from the plants. Other cut flowers are Eucharis, Gardenias, Camellias, Violets, Bouvardias, Christmas Roses, Lily of the Valley, Carnations, and a few Orchids. This concerns the flower market proper, which, as already said, closes at 9 A.M., but the florists' shops in the central avenue are open and attractive all through the day.

Turning to the fruit department the visitor finds a similarly busy scene. What a babble of tongues! How bewildering to those who look on for the first time! Thousands of barrels of Apples and boxes of Oranges are sold by auctioneers, all shouting against each other as if their very life depended upon it, so keen is the competition. To those unacquainted with market phraseology the words and expressions are unintelligible. But not so to the regular buyer. Watch for a moment and see how rapidly the bidding goes on; and quite as quickly the barrels and boxes pass out of sight to give place to more. It is a significant and regrettable fact, however, that English Apples are most conspicuous by their absence. The bulk of the Apples now in the market are Baldwins, Newtown Pippins, and other American varieties, the best of these selling freely at from 12s. to 15s. per barrel. Pears did not appear to be so plentiful, a few hundred boxes from France and some from California being all that were noticeable. Pine Apples, on the other hand, were numerous and cheap. These come to hand from Madeira, and are sold for 3s. to 6s. each. English Pines are apparently very scarce, and good samples of these would doubtless realise remunerative prices. Bananas were not so well represented as they are sometimes, though probably the supply is equal to the demand. The same may be said of English Grapes, well-grown samples of Gros Colman and Muscat of Alexandria being principally seen in the leading fruiterers' shops. The Almerian and other foreign Grapes, however, which come to hand packed in baskets of cork dust, are numerous, and are sold at cheap rates. Nuts of various kinds are to be seen in plenty, with the exception of Kentish Cobs. Good samples of these are scarce, and they sell freely at 1s. and upwards per pound.

What has been said in regard to the flowers and fruit applies with equal force to vegetables. Here, perhaps, the apparent confusion is trebled. This department is not, as the uninitiated may suppose, confined to the market proper, but extends to the whole of the adjoining streets. These are almost impassable during the early morning hours, so numerous are the heavily laden vans of produce. The trade is carried on briskly, and the competition is keen among the sellers; for soon after daylight at this time of the year all must be cleared away to make room for the ordinary traffic. Time and space will not permit the enumeration of the different kinds of favourite vegetables, but it may be said that in this case, as in fruit and flowers, the best produce realises the highest prices.

Perhaps, however, the most striking features in Covent Garden Market during the week preceding Christmas are the huge masses of evergreens and the thousands of crates of Mistletoe. The trade done in these is enormous. Although far removed from the spots where such grow naturally, Londoners will not pass a Christmas without the customary and time-honoured decorations. Piled vans of evergreens of all descriptions are brought into the market, and most of the produce is eagerly sought after. The Holly appears to be exceptionally well berried this season, and is selling freely. The bulk of the Mistletoe comes from Normandy and the other fruit-growing districts of France, and this, like the Holly, is literally covered with berries. If, however, there is any truth in the report as recently published in a daily contemporary, that an edict prohibiting the culture of the Mistletoe has been issued by the French Government, it is very probable that we shall have to obtain our

supplies elsewhere are long. The juveniles are not forgotten, for Christmas Trees are, as usual, sent by the thousands. Many of these are the tops of Abies, whilst not a few are grand young specimens torn apparently from the soil regardless of the roots. Such matters are of a trivial nature to the market man so long as he can realise good returns, and unconsciously perhaps assist his purchasers to spend a merry Christmas.—C. C.

[We desire to give expression to our wish that all who engage in producing and all who encourage the production of the riches of the earth, with those who share in them, will enjoy to the fullest extent possible a truly happy Christmastide.]

PRICES AND QUALITY OF APPLES.

It has been my privilege more than once to stand by, an interested observer, when two giants of the chess arena have been locked in an absorbing struggle. As the pieces have been shifted on the board, attacking, defending, advancing, receding, I have seen how one master, his whole nervous system focussed as it were on an intricate interchange of positions, has overlooked some point, trifling in itself, but eventually developing into the key with which the whole structure that he has erected with such infinite pains and skill has been opened and exposed by his opponent. Pitted against the defeated champion my chance would be small, but when in a position to calmly survey both sides I am able to perceive the error which he has overlooked. No fruit grower, I imagine, would be more likely to appreciate the compliment of a comparison with the Gunsbergs, the Blackburnes, or the Laskers of the chess world than one who submits that his fruit is acknowledged to be "the finest and best packed" that ever goes into the markets; I therefore leave Mr. Walter Kruse to turn over this morsel and digest its moral, passing on to the salient points of his letter on page 530.

In entering seriously upon this discussion—and the subject is of such far-reaching importance as to merit being thoroughly thrashed out—let us clear the ground and define the end in view. I deem it wise to suggest this course as an important preliminary step in order to guard against that introduction of side issues which inevitably occurs when a disputant finds he has placed himself in a false position. Fortunately Mr. Kruse supplies a definite groundwork in one sentence of his second communication. He says, "My object in writing in the first place was simply in order that readers of your Journal should not be misled by seeing 6s. a bushel stated as the price of Apples when the average price of Apples home to the grower has been very much less." I thought that he wished originally to limit his remarks to the one variety mentioned, but as in the quotation above he refers, not to Domino Apple, but twice to "Apples," it is clear that he desires his remarks to have a general application. I accept *his* amendment; indeed, if the general question of Apple-growing for profit is to be considered it would be absurd to limit its scope to one variety in face of the fact that so many are cultivated.

Unfortunately, however, for Mr. Kruse, when I permit him to shift the ground of the debate on to the broader and admittedly more reasonable ground indicated, the weakness of his attitude only becomes more apparent. Of the Apples I have named Domino, growing in an exposed position and unfavourable soil, where few fruits would thrive at all, is the only one to have returned so low a price as 4s. 6d. per bushel, the average price of the others being 6s. Now how are we to get an absolutely just and fair idea of the general return? Admittedly there is but one way, and that is to strike an average. When out of six varieties five yield 6s. a bushel and the other one 4s. 6d. the average return for the fruit is exactly 5s. 9d. per bushel. I attempt no quibbles and try no sophistry in this matter. Mr. Kruse himself widens the discussion, and I show him by plain facts and plain figures that although the error (an error so frankly admitted as to show that no desire but to get at the true facts is entertained) at first sight appears serious, yet on being subjected to the only just test that can be supplied it is proved to be absolutely trivial. Here is the case plainly stated, and the result set forth. The average price is not 4s. 6d., not 6s. per bushel, but 5s. 9d., and after accepting Mr. Kruse's own estimated deduction of 1s. 3d. for carriage, &c., what do we get? An actual return to the grower of 4s. 6d. per bushel, a very close approach to the 4s. 9d., which, in the case of his fruit ("the finest and best packed" that ever goes into the market) he admits to be "very exceptional."

I have put this matter with the utmost fairness, accepting Mr. Kruse's own estimates and quotations without question. I leave him to make the best he can of the position, and, taking more of

his own figures, I pass on to ask him a few pertinent questions. Your correspondent's object in writing in the first place was to prevent the public being misled. He is consumed by a desire for the truth, the whole truth, and nothing but the truth about the profits of fruit growing in England. This is a most laudable desire, and I share it to the full; hence the questions I am about to put. Mr. Kruse claims that his wages bill for men averages £500 a year, and for women £30 a week in the season—let us say another £500 for the year. There is a third £500 a year for manure (truly this is not stinted since £500 a year is spent on forty acres of land!), making £1500 a year without taking into consideration the outlay for baskets or other matters, which must be considerable. What I want to ask is this: Whence comes this £1500 to £2000 a year simple expenditure? The days of the goose which laid golden eggs are over. Has Mr. Kruse some great store from which he draws the means to run his farm, keeping it going as a philanthropic institution for the benefit of the industrious poor? And if not, if what he puts into the laud is yielded up again with interest by the fruit that is sold, what is, what *can* be, his motive in circulating warnings the effect of which may deter others from entering on the field wherein his livelihood is earned?

In my former communication I quoted the experience of two growers, one of whom declared his inability to afford good cultivation for Apples, because they only brought 2s. 6d. a bushel; while the other, by finding that he could afford it, secured 6s. (really 3d. less). Grower No. 1 blundered over cause and effect, and he pays the penalty accordingly; but it is melancholy to find one who advances claims to be considered an enlightened fruit grower expressing pleasure that he has support from such a cultivator, and ignoring the true lesson of the parallel cases. It would be absurd to suppose so intelligent a man as Mr. Kruse is, incapable of comprehending the point (which Mr. Pearson has so strikingly emphasised); I ask him therefore, Does he really throw in his lot with the 2s. 6d. a bushel man who does not cultivate, in preference to taking sides with the 5s. 9d. a bushel man, whose farm is the perfection of good management? Even if he does make this choice, he will find that he is leaning upon a false reed, for his supporter's remedy for low prices is exactly the opposite of his own. He would have planting stopped, on the ground that the supply is already too large, instead of planting more.

While ostensibly acquitting me of complicity in the ill-doing of those who hold out fruit growing as an Eldorado, Mr. Kruse endeavours, in an oblique kind of way, to connect me with them. He has not a shadow of justification for anything of the sort. I lose no opportunity of heaping ridicule upon the armchair fruit growers, whose profits are made with pen and ink by the fireside, and the suggestion that because I believe and state that there is a reasonable profit in fruit growing when carried out in the best manner, I am to be in any way linked with the stick-in-a-tree-and-sit-down-to-wait-for-the-money brigade is as preposterous as it is unjust. As well might I take Mr. Kruse's admission that there is profit in fruit growing to be tantamount to saying that everyone who invests in it will realise 70 to 80 per cent. on his money. Far from exaggerating the returns I have kept many facts back solely because I have feared that inexperienced persons might found unsound expectations upon them. On my table now I have Apples of which a large bulk yielded a home return to the grower of 6s. per bushel, and others forming part of a crop of Cox's Orange Pippin, 1 acre of which has this season yielded the grower a home return of over £100. Even this high figure has been exceeded, but I have never quoted such a return to any inexperienced person without a strong intimation that it is only produced in a favourable season and by the most skilled culture.

The truth of this matter must be apparent, and my position is strengthened by the testimony of such able growers as Mr. Pearson and Mr. Molyneux. There is a fair return for capital invested in fruit growing when well done, a good return when it is conducted with the utmost skill and intelligence. The spectacle of Mr. Kruse blowing hot and cold by turns, speaking of a profit one moment and hinting darkly at loss the next, is not instructive. Although practically he is on our side, yet theoretically he is sitting on the fence, struggling vainly to balance himself and to hold up the shapeless and inert bogey of large accumulations of capital at the same time. He should let it drop, and jump boldly down on the right side. America has lost her Gould, and there is no room for even his ghost here. Quality, not quantity, is the watchword of success.—W. P. W.

WILL your correspondent, "W. P. W.," mention the cost per tree of "a dressing of kainit and superphosphate, spread from the stem outward," and the "light sprinkling of nitrate of soda to follow?"—B. D. K.

The cost per tree must obviously depend on its size, and consequently the extent of ground occupied by its roots. If your

correspondent's trees are young, and make moderate yet not sufficiently strong growth, superphosphate of lime applied at the rate of 3 ozs. per square yard in February would improve them, following early in April with half the quantity of nitrate of soda. If the soil be light 2 ozs. of superphosphate and 1 oz. of kainit might be better *plus* the nitrate of soda. Strong soils often contain enough potash. He will now be able to calculate the quantity required, and the cost per tree can easily be ascertained as founded on the cost of the fertilisers. Old or nearly exhausted trees may have a double dressing, but strong liquid manure applied copiously any time when it will pass into the soil in winter is the quickest restorative of such trees.—W.

STEALING OF FRUIT AT THE EDINBURGH SHOWS.

DURING the autumn of last year you kindly gave myself and others permission to ventilate the above disagreeable subject in the columns of the *Journal of Horticulture*. So conclusively were the allegations proved to be correct that not one of the Royal Caledonian Horticultural Society's many champions ventured to offer a single word in defence of the Council's management of their shows. After this exposure exhibitors naturally expected that something would be done to keep the light-fingered gentry in check. The Executive, however, take a different view, and pass a new by-law, which reads as follows:—"The Council reserves right to refuse any entry without giving any reason therefor." I have it on good authority that this by-law was made with the object of enabling the Council to debar from future shows those who had the courage to publicly complain of the Society's mismanagement. With regard to myself, this arbitrary by-law was practically put in force last autumn. I sent in my entries as usual for the September Show, and had them returned marked "Entry refused by instructions of Council in terms of By-law No. 6.—CHARLES STEWART, Hon. Sec."

I subsequently sent the following letters:—

September 5th, 1892.

To the Council of the Royal Caledonian Horticultural Society.

Chas. Stewart, Esq., Hon. Secretary.

Sir,—I am in receipt of the entry forms returned by you. It was upon the strongly urged advice of a member of the R.C.H.S.'s Council that I was prevailed upon to forward them. It is a matter of indifference to me whether I exhibit at your shows or not, but so long as I continue to exhibit I will always denounce any pilfering of my employer's property, and, as far as I know, this is the only reason that can be assigned by your Society for the rejection of my entries.—Yours truly, J. MCINDOE.

[NO REPLY.]

September 9th, 1892.

To the Council of the Royal Caledonian Horticultural Society.

Chas. Stewart, Esq., Hon. Secretary.

Sir,—Upon further consideration of the rejection of my entries for the past autumn Show at Edinburgh, I think it would be only an act of courtesy if the Council would let me know the reason my entries were rejected, at the same time I note your By-law No. 6.—Yours truly, J. MCINDOE.

[NO REPLY.]

The question I desire to ask directors of shows, exhibitors, and all who are interested in exhibitions is this:—Are the Council of the Royal Caledonian Horticultural Society carrying out the best interests of horticulture when they year after year permit pilfering of exhibits to an alarming extent without taking proper precautions against it, and when unfortunate victims complain they are excluded from future shows?—JAMES MCINDOE, *The Gardens, Hutton Hall, Guisborough.*

[Our correspondent sends us his entry form properly filled up (eleven classes), with the refusal written across it, as above mentioned. Our readers are at liberty to express their opinions on the whole subject either in justification or the reverse of the action of the authorities.]

EXACUM MACRANTHUM.

THIS *Exacum* has just claim to be placed amongst the most beautiful of stove plants, and it is a regrettable fact that it is so seldom seen. The plant is of comparatively easy culture, neat in habit, and generally grows to about 18 inches in height. When laden with richly coloured flowers, that can compare favourably with any other occupant of the stove, the plants present a most charming sight.

The blooms (fig. 72) are about 2 inches in diameter, the corolla being divided into five broad ovate segments, slightly recurved, terminating

in a rather sharp point. Their colour is of indescribable richness, being a rich indigo purple with a satiny sheen; the flowers, which are borne on a terminal corymb, being the more striking by the deep yellow prominent anthers. The leaves are opposite, those on the upper part of the stem being sometimes 3 inches long and an inch wide, tapering to both ends; the lower leaves are smaller and less pointed. They are bright green and slightly ribbed. It was found in Ceylon at an altitude of 6000 feet, and, though still rare, it is worthy of being largely increased and widely distributed.

FIG. 72.—EXACUM MACRANTHUM.

ON GROWING JAPANESE CHRYSANTHEMUMS FOR EXHIBITION.

[Read at the Horticultural Club by the Worshipful the Mayor of Taunton: W. H. Fowler, Esq.]

I HAVE been asked to contribute a short paper on the above subject, and I do so with considerable diffidence, for two reasons. First, because I have been a grower for a comparatively short period; and secondly, and more particularly, because the subject has been so scientifically and ably dealt with by many other growers of much greater experience than myself. I purpose, therefore, to give only the general outlines of the method we adopt, and make more especial mention of any details which have been tried by me as experiments, and the results obtained.

I think the most convenient point to start from is the treatment of the old stools and the taking of cuttings. As soon as the flowers are cut from an old plant the stem is cut to within 4 inches of the pot and it is placed in a cold frame. I may here say that I strongly believe in making the plants as hardy as possible all through their period of growth. I am quite aware that in some less favoured parts of the country than that in which I reside it will be found necessary to use some heat in the frames in order to exclude severe frosts, but the less it is employed the better. In my case the frames are unheated, and in severe frosts they are covered with

thick straw mats, which I find answer the purpose well. I think it is a mistake not to give the old stools some stimulant, as almost the whole of the nature of the soil must have been exhausted by the time the blooms have been finished. In order to get good strong cuttings I give two doses a week of weak manure water made in the usual manner from cow or sheep droppings. It is also a good plan to give a slight top-dressing of good loam. The further the cuttings can be procured away from the stem the better, and never take any from the stem itself if it can possibly be avoided.

It is a good plan, I think, when the season is in full swing, to take careful notes of all the varieties and make out a list of the sorts you intend to grow for another season and the number of cuttings you will require of each. It will be found necessary to grow more of some varieties than of others which are equally good as to the flowers, as some are very brittle and suffer much from the wind; others will carry three or even four good flowers, and some only one. Some are also much more difficult to bring out to time. Then, again, certain varieties must be discarded every year to make room for new ones of greater excellence. Let us then suppose that we have our list drawn up and the time for taking the first cuttings has begun. It will be found necessary to strike or attempt to strike quite 25 per cent. more cuttings than you will have room for as full grown plants. Some of the cuttings will not strike, later on some plants will be lost through various causes, and it is best when the time for the final potting comes to have extra plants, so that only the strongest and those which promise to come right as to time shall be grown on through the summer.

PROPAGATING AND POTTING.

The season of striking cuttings begins in the second and third weeks of December, and goes on at intervals till the end of February. I strike all my cuttings in a close frame in a warm greenhouse and use no bottom heat. The soil is composed of well rotted top spit with plenty of sand and some charcoal. Last season I adopted the plan suggested by Mr. C. E. Shea of adding a little of the ash produced by burning the old stems and foliage of the last season's plants. This, I think, is of assistance to the plants when they have become rooted and established in their first pots. I do not propose in this paper to give a list of all the varieties we grow and the dates at which their cuttings should be taken. These will be found by referring to the excellent work of Messrs. W. & G. Drover. Of course the time must vary slightly with the district. As a general rule the latest varieties should be struck first and so on, though there is some modification in this when stopping in April is practised. The cuttings are kept fairly close till rooted, after which they are taken out and placed in cold frames and have no heat till they are finally housed. It is most important to give them plenty of room in the frames. If this is not done they will get drawn up, leggy and weak, and will never make good plants.

I think it is a good plan from the first to keep each variety by itself; by doing so the grower will save a great deal of time, as certain varieties require more shifts than others, and as these shifts are given at no fixed dates, but when the plants require them, it can easily be understood that to have to look through, say, 800 or 1000 cuttings for twenty-five of *Avalanche*, would be a lengthy process if all were indiscriminately mixed together. It is important to place the rooted cuttings near the glass on a cool bottom. The plan I adopt is by resting corrugated iron sheets on inverted pots and then putting 4 inches of sifted coal ashes on them. This makes a cool bed, and can be adjusted to any desired height. The frames I use are Boulton & Paul's span-roof ones 8 feet wide. They have an admirable method of top ventilation, which is especially useful for the plants in their early stages, when very often the east wind is too cold to allow of the lights being raised. Frost is excluded by the use of thick straw mats, and no artificial heat is used. The plants are kept well apart from each other, and are given more room as they require it. This is most important. Never let the plants in their young state get root-bound. Some varieties will require four shifts, others only two. No rule can be laid down, but all must be repotted when they require it. Every now and then the different varieties are looked over, and any that require it are repotted. The same compost is used, but with less sand and a little leaf mould is added.

We will suppose that we have now arrived at the month of May. The plants are now strong, and some may be placed outside the frames, placing a stick to any that require it; the rest may remain in the frames, and the lights removed. No definite rule can be laid down for the final potting. We begin about the last week of May, when the first plants require it, and then work steadily through the whole stock as they require it. The operation lasts with us about three weeks. The compost I use is as follows:—Four-fifths prepared fibrous loam, one-fifth leaf mould, to this is added some sand, half-inch bones and charcoal. No manure of any

kind. The loam we use is the best top spit cut 2 inches thick, which is stacked in layers, turf downwards, and covered with corrugated iron to keep out the rain. It is chopped up rough, and all fine parts put on one side. It should be on the dry side rather than wet. For certain weak growers, such as Mrs. *Alpheus Hardy*, I use two-fifths loam, two-fifths peat, and one-fifth leaf mould. Two sizes of pots are used, 8½ and 9½ inches in diameter. Those made extra deep as supplied by Messrs. Sankey are the best I have used. Give plenty of drainage, and some rough soil and half-inch bones over it, and pot very firm. After potting the plants stand in the shade for some days till the roots begin to take hold of the new soil, and the plants have got over the check. No water at the roots will be required for some days, but a sprinkling or syringing twice a day will be all that is necessary. Labels should be new and long, so as to give plenty of room for notes as to time of taking the bud, and other details.

TREATMENT DURING THE SUMMER.

As soon as the plants can stand the sun they are placed in their summer quarters in the open, so as to get the full benefit of sun and air, and carefully tied to two strands of iron wire. The plants during the summer stand over iron troughs filled with water. In these troughs are placed 6-inch lengths of 5-inch drain pipes on which the pot stands. Each plant is thus surrounded by water. This almost entirely prevents earwigs from getting on the plants, and also produces a moist atmosphere on very hot days. The plants grown over water have with me better foliage than those placed on the ground. To further keep the earwigs at bay we tie cotton wool soaked with paraffin round the posts, and renew the wool and oil once a week. The result of this experiment has been that during this season (which has been an unusually bad one for earwigs) we have, out of some 560 plants, only lost three or four; while in an ordinary way I should expect to lose fifty or sixty. I may add that my plants are grown on the grass, which harbours the earwigs and makes them more troublesome than they otherwise would be. The rows run east and west, and the plants are turned round twice during the summer. We give plenty of room between the plants, so as to ensure ripe wood and good foliage. The lines are about 10 feet apart.

The principal work during the summer is that of watering and also of tying the shoots as they grow. Every plant is tapped with the knuckle to find out the amount of water required. Too much is almost as bad as too little. Any neglect of watering may mean the total loss of all your exhibition chances. No cold water from the mains should be used. All water should stand for twelve hours in tubs exposed to sun and air before being used. Rain water is the best. As to feeding, I give no stimulants at all till the last week in August. In this I believe I am almost alone, as most growers begin in July. I believe, however, that if the potting soil is really good that the end of August is quite soon enough. I use five or six different manures, but always in a liquid form, never giving the same fertilizer twice running. I believe that liquid manure from sheep, cow, or horse droppings, prepared by placing in a sack and allowing it to soak in a tub of water for a night, is one of the very best stimulants. Be careful not to use it too strong to start with. Of prepared manures there are many very good. Pure *Ichthemic guano*, *Wood's* and *Standen's* manures being my favourites. Sulphate of ammonia is only used to hurry up a late bloom, and must be very carefully used. Between every watering with stimulants we give two or three days with clear water. This I think keeps the ball clean and the plant healthy. Never use stimulants in strong doses; the result will be burnt roots and a ruined bloom.

One of the most important details with regard to growing for exhibition blooms is the timing of the blooms—*i.e.*, to get the bulk of your varieties out at about the same time. Now, while we have some varieties that are naturally early, and others late, we must find out means of retarding the one and accelerating the other. I cannot go deeply into this subject, as it is too large. I will only say now that we arrive at the desired end by stopping—*i.e.*, taking out the point of the leader—the plants at different times. Thus a plant of Mrs. *Alpheus Hardy* or Mrs. *F. Jameson*, stopped in April, will give good blooms from crown buds about the second week in November, whereas if they had been grown in a natural way they would never have given an exhibition bloom. Taking the buds is a subject that is now so generally understood that I will not enter further into it, beyond saying that if a plant is found to be too early or too late for the shows it is waste of time, so far as exhibiting is concerned, to bother further about it. The room of such plants is more valuable than their company (from an exhibition point of view). Of course with new varieties one must keep all to find out what their habits and what is their natural time. In the case of the older varieties their time is known within a few days, and such varieties when out of time should not be

housed unless there is ample room for the rest of the stock. Then there is the question of crown or terminal buds. This depends entirely upon the variety, and must be learnt by experience or by reference to works, where all the principal varieties are tabulated, and their peculiarities noted.

HOUSING THE PLANTS.

We will now enter upon the important step of housing the plants, which takes place at the end of September. First take care that your houses are perfectly clean, if fresh painted so much the better. I always house a plant on the very first symptoms of showing colour in the bud. I am quite certain that to leave such a plant outside means simply the loss of the flower. I have found by experiment that with good blinds and proper ventilation a house can be kept cooler than the air outside, and a bloom kept in such a house will open later than one kept outside and will not be ruined as in the other case. I house the bulk of my plants during the last days of September, and have all in by October 2nd or 3rd. It is always a relief to me to know that they are safely housed and out of the way of the strong winds and frosts which often do so much harm at that time of year. When all are in, give a good smoking in two successive nights to kill all green fly. After that give plenty of ventilation night and day till the middle of the month of October.

I may say that several small houses, where the temperature can be regulated, are far better than one large house. Some varieties require more heat than others to get the best results, and some will want hurrying on and some retarding. I prefer a three-quarter span house, with front and back ventilation. From 1 foot to 2 feet will be found the best distance for the blooms from the glass. It is important to house the plants when dry. All houses must have blinds, or shading should be used, as no blooms will stand the sun after they show colour. A perfect house to my mind would have an outside and also an inside blind; the latter is most useful in protecting the blooms from drip caused by condensation. Many blooms supposed to have damped in the ordinary way are lost from this cause. Avoid all draughts, but always allow plenty of air, except when very cold or rough outside, when great care must be exercised. After the plants are housed they will require less water, and stimulants must not be given after the bloom is half out.

Then there is the great damping question. Thousands of blooms are lost every year from this cause, and various theories advanced to explain it and advice given for prevention of the evil. I do not myself believe that the use of stimulants is in itself the main cause. I have had plants damp off which have had no stimulants at all. I think the real reason of the disease arises from the fact that we grow only one, two, or three blooms on a plant which is capable of growing perhaps as many hundreds, and that the amount of sap in the plants fails to find sufficient work to do, and causes the evil. Some blooms no doubt are lost from the wood not being properly ripe. I think that careless ventilation is one great cause of blooms damping. Avoid all draughts, and on no account allow the sun to get on the blooms. Some varieties are much worse than others. Those with heavy foliage are much more difficult to get ripe, and proportionately disappointing. I intend next season, as an experiment, to reduce the foliage of some varieties. I have lost eighteen splendid blooms of Col. W. B. Smith out of twenty this season, and the plants were the best among my collection.

On setting up the blooms and taking them to the shows I will only say a few words. I think that the best tubes are those patented by Mr. E. Beckett and bearing his name. I use them in conjunction with the Jameson clip, which enables one to adjust the bloom to any desired height. A great deal can be done by careful arrangement of the colours. I believe in placing the largest blooms in the back row. On one matter I feel strongly, and take this opportunity of expressing it. A habit has crept in among exhibitors of altering the character of many blooms by spreading them out by means of cardboard discs and wire crinolines. The object is to give the stand an appearance of weight which it does not really possess. I think that the time has come when this practice should be put a stop to, and all tubes limited in diameter to a certain specified size (say 2 inches), and no other supports allowed. If this were done we should hear less about the boards not being large enough. At the October Show of the National Chrysanthemum Society I saw two good blooms of E. Molyneux entirely spoilt by an enormous card being placed between the tube and the bloom. Instead of being deep solid blooms they appeared to be quite flat, and altogether out of character. I think that the Judges should persistently go for deep solid flowers, and ignore all such manipulated blooms.

BEST VARIETIES.

Now that new varieties of merit are so constantly appearing I feel that it is almost impossible to give a complete list of the

best varieties of Japanese Chrysanthemums; but I give below a list of those I think are the leading forty-eight at the present time, not in the order of merit:—Mrs. A. Hardy, Vivian Morel, Etoile de Lyon (terminal), Mrs. E. W. Clarke, Puritan, Mrs. C. W. Wheeler, Stanstead White, Violet Rose, R. C. Kingstone, Colonel W. B. Smith, Mrs. E. D. Adams, W. W. Coles, E. Molyneux, W. Tricker, Florence Davis, Coronet, G. C. Schwabe, Gloire du Rocher, Gloriosum, Mrs. Herbert Fowler, W. H. Lincoln, Sarah Owen, Madame J. Laing, Sunflower, Mons. Bernard, Avalanche, Mrs. F. Jameson, Mdle. Marie Hoste, Miss Anna Hartzhorn, Japonaise, Eynsford White, Madame Baco, Lilian B. Bird, Lord Brooke, Beauty of Castlewood, Beauty of Castlehill, Aida, Ruth Cleveland, J. Stanborough Dibbins, Mrs. J. S. Fogg, Beauty of Exmouth, W. K. Woodcock, Lady T. Lawrence, Mr. A. H. Neve, W. Lane, Hamlet, Boule d'Or, and Ralph Brocklebank.

I hope this paper has not been too long, but the subject is so large that I could have written much more, and I assure you that I have found it an unfailing source of interest during the last four years. I would strongly advise any who have the opportunity to try and grow a few plants next year, and note the many differences which are to be found in the habits and likings of this most interesting family.

AN ORCHID CAROL.

IF a "song of joy and exultation" can ever be sung over Orchids surely it is at Christmastide, when the wings of the darkness are spread over the garden and outdoor plants are sunk in slumber. It is true that we do not possess them in their springtide glory, when the delicate tremulous blossoms droop from the knotted growths and hang from blocks and baskets in lavish profusion. But their scarcity adds to rather than detracts from their interest, making us admire and treasure them the more. For centuries they flowered and waned with none but savage eyes to see them in the dense primeval forests. To the wild man the sight of the flowers emerging from the twisted and gnarled stems hid no parable, and so to all intents and purposes they "blushed unseen" until the wandering feet of the white explorer led him to their haunts.

In singing a Christmas carol about Orchids, albeit in prose, one is embarrassed by their many-sidedness. Some flowers we love because they have been long with us, and they are as the dear faces of friends. Others we cherish—sternly utilitarian—because they serve some special purpose of the season. It can hardly be said of Orchids that they claim special recognition under either of these heads, and yet who will see that they do not eclipse all their rivals? We call them aristocrats, and perhaps instinctively feel less familiar with them than with the modest old friends which we take to our hearts at this festive time; but that idea, I must contend, is wrong. They are vested with delicacy and infinite grace, still they have the sweetness and sympathy of the truest beauty. Many admire Orchids, few feel that they can dare to love them; but one may get beyond a bowing acquaintance without a snub, and, thus encouraged, learn to feel affection for them, even as we do for a Violet or a Rose.

Claiming indulgence from the revising official in possession of the editorial chair for such vagrant fancies because of its being Christmastide, I may be allowed, perhaps, after writing thus to go farther, and suggest in Orchids higher qualities still. Real nobility ever lends an ear to the sick and needy, and its floral prototype would never be more at home than in soothing the sufferers whose Christmas greeting is uttered by the hospital nurse. Would these delicate wax-like ornaments of our hothouses be out of place, think you, there? Rather is it that their loveliness has found its proper task when ministering to the wants of those who are smitten, and who mourn while their fellows rejoice. What beauty is there in that which does not move the breast nor stir the intellect? Orchids surely are capable of doing both. So let us surround ourselves with them and every fair thing that will tend to higher aspirations and wider thought.

But writers, like preachers, are the better for some inspiration, and so I journey out a few miles beyond the city smoke and seek it, where of all other places it is most likely to be found at the drear midwinter season. Should anyone be tempted to think that an Orchid carol must be forced and lack spontaneity he should spend an hour or two at Christmastide in the great Sanderian home not far from the Cathedral of St. Albans. No flowers! Why

there are visions of loveliness that would have filled the good saint's heart with gladness could he have seen them in the long ago. So far from there being "no flowers," the difficulty rests in which to choose. Well may the first pause be over so beautiful and chaste a Christmas Orchid as *Laelia autumnalis virginalis*, an ivory-like flower, the purity of which is only broken by a mauve stripe across the throat. And not less worthy of remark is the hybrid *L. Oweniana*, a cross between *Dayana* (seed parent) and *xanthina*. It is a dwarf form with white sepals and petals, the side lobes of the throat enriched with purple. Warmth is imparted by *L. Gouldiana*, glistening and shimmering with a lovely rosy carmine glow which suffuses the sepals and petals. The throat is tinged with yellow and lined with brown streaks. *L. anceps Oweniana* gives beautiful combinations of colour. The petals and sepals are rich rose, paler at the base, and with broad, Carnation-like flakes; its lip magenta, the side lobes of the throat striped with brownish purple and the edges rose. *L. Gravesiae* (*crispa superba* × *præstans*), soft blush with purplish magenta lip, presents pleasing contrasts, and the white variety of *L. anceps* is admired for its purity. With hundreds of others showing bloom, he would be bold indeed who would say that "Christmas Orchids" was a misleading term even if we had *Lælias* alone.

But *Oncidiums* and *Odontoglossums* yield their quota of interest and beauty. *On. Phalaenopsis* has rose and white flowers that cannot fail to charm. *Od. Insleayi* *Leopardinum* and *Od. I. splendens* give quaint harmonies in green, chocolate, yellow and brown. The first has green sepals with chocolate blotches, the lip clear yellow and marked with rich crimson maroon; the latter has larger and finer light brown flowers, the lip pale yellow with reddish blotches round the edge. *Od. Phalaenopsis* and *Od. Roezli* are in bloom also, the latter being represented by the white and red varieties, both beautiful. *On. Gravesianum* is bearing long wreaths of its brown and yellow blossoms, while *On. cheiroporum* uplifts spikes thickly furnished with small yellow flowers. *Od. Pescatorei* and *Od. crispum* are coming in thousands. *Od. Rogersi* and *Od. maculatum* are both there, while the rare and chaste *Od. Rossi* albens charms with its delicate beauty.

Cattleya time is far distant, but a few of this noble race enrich our store of Christmas Orchids. *C. labiata* might naturally be expected to be amongst them, and there it is in truth with its rich and glistening flowers, so well suited for catching the reflection of the illuminations of the Christmas table, and assuming new charms with every fresh ray of light that falls upon it. Ah! but there is a still fairer jewel, a white variety, pure as the driven snow, and with only a faint tinge of yellow in the throat to relieve its chasteness. It appeared in a *Sanderian* importation of *labiata*, and the fortunate owner is Mr. Wells of Broomfield, Sale. It has all the noble proportions of its parent, and must rank as one of the loveliest Orchids in all our rich store. *C. O'Brieniana* is widely different, coming nearest, perhaps, to *C. Walkeriana nobilior*, but is beautiful, too. Its sepals and petals are soft lavender with a rosy suffusion, the lip deeper. *C. amethystoglossa* *Selwood* variety is another gem of this genus now in bloom. The flowers, borne in a cluster of six, are stout in texture and beautifully marked. The sepals and petals are cream spotted with magenta, the lip and upper part of the tube rich magenta.

Of the Christmas *Cypripediums* but a faint idea can be given. They contribute the most generously of all, and their harmonious hues yield as much pleasure as their quaint forms do interest. *C. Lathamiana* (Clark's variety) and *C. nitens* (St. Albans variety) demand the detailed description that want of space forbids, for both are handsome and distinct. More powerful still are the claims of the three splendid *Leeanum* varieties—*gemmaum*, *giganteum*, and the *Audenshaw* variety, for this extending section is one of the most beautiful and valuable of all. The dorsal sepal of the *Audenshaw* form is almost circular, and nearly all white, but with a broad central stripe of purple. It is the opposite cross to *C. Leeanum*. *C. Johnsonianum* is altogether a distinct type of flower. It is a cross between *C. nitens magnificum* and *C. Lawrenceanum*, the former being the seed parent. The petals and pouch are of rich burnished chocolate, the dorsal sepal green thickly spotted with purple, and with a broad white margin. *C. Calypso*, *Oakwood* variety, and *C. Alcides superbum* are again distinct, and each in its way beautiful. *C. Chamberlainianum*, one of the most distinct and effective of *Cypripedes*, is in bloom too. Imported plants of the Slipper Orchids are packed together in thousands, like *Rhubarb*. May some of them swell the ranks of Christmas Orchids with valuable additions when the time for blooming comes.

The list is by no means exhausted yet. Fine plants of hybrid *Phaius* are opening their flowers, and *Phalaenopsis*, which, despite their peculiar reputation, grow like weeds, are full of bloom. *P. amabilis* and *P. Sanderiana*, with their arching sprays of chaste and lovely blossoms, are ideal Christmas Orchids. *P. Esmeralda*

grandiflora, blush with magenta lip, is distinct and charming. *Lycaste Skinneri* and *alba* add their mite, as also do the small white *Dendrobium Fitchianum*, the Penguin Orchid (*Catasetum discolor*), *Cymbidium eburneum*, of which there is a splendid stock, *Epidendrum macrochilum album*, *Angiæcum Sanderianum*, *Dendrobium Cassiope*, a pyramid of blossom and nearly always in flower, the lavender coloured *Calanthe Sanderiana*, and others that might be named if considerations of space did not stand in the way. Enough has been gleaned from this marvellous Orchid home with its 100 yards long houses, fitted with every convenience that means and skill have been able to provide, with its myriads of plants in magnificent condition, and with its railway line and station for dealing with the vast imports and exports of the establishment, to show that there are Christmas Orchids in abundant numbers, variety and beauty.

If I may venture one gentle criticism about Orchids in this, my carol, before concluding, it would be directed to the system that looks not for value in the beauty of the flower but in oddities or peculiarities of marking. It is this which puts Orchids so much beyond the pale of human affection and sympathy as to make men regard them as objects to marvel over rather than to love. After all they are flowers, and flowers, too, with possibilities of greater good than accrues from furnishing material with which wealthy men gauge each other's riches. I take advantage of the heart-opening and brotherly love which Christmastide so widely calls forth to urge that Orchids are not alone stocks to be gambled with nor idols to be worshipped, but ministering angels from the great flower paradise to soothe the sorrows and beguile the sadness of humanity.—W. P. WRIGHT.

SHOWING AND JUDGING HARDY FLOWERS.

I HAVE read with considerable interest the letters upon the above subject. I did not intend taking part in the discussion until I read on page 521 Mr. J. A. Williams' remarks. "Nothing can be more inartistic nor hideous than the flat, squashed-up huge bunches of annuals, biennials, and perennials such as are now staged at most shows." Similar words have often been expressed by me. Flowers would be more interesting and instructive upon the exhibition table were they exhibited in their natural growing state. This has been long in custom at some shows with Stocks, Love-lies-bleeding, and other annuals; why not with others? Full spikes only of hardy border flowers should be staged, except in those cases where single specimen flowers only are appropriate. By the encouragement of such a system plants would be better cultivated, and not crowded in thickets, as is the case in so many gardens.—W. T. B.

THE subject of the satisfactory exhibiting of hardy flowers at shows, whether in bunches or otherwise, is well worth discussing, at this time of the year especially, as it may lead to some needful changes being made in the phraseology of schedules before those for next year are issued. I think the proper designation for the class or classes referred to would be "hardy garden flowers," and that designation would of course include flowers of every hardy plant, tree, or shrub that grows in gardens. But that would be thought perhaps in most instances to be too wide a class, as, for instance, in many shows there is found a class or classes for annuals in bunches; where these are found, then in any class for hardy garden flowers annuals should be specially excluded. Still farther it would be found desirable to exclude Roses and shrubs. These are, of course, "hardy border flowers," and therefore it would be easy also to say "Roses or shrub flowers excluded." What is wanted is to form, in a simple, lucid, yet comprehensive fashion, classes for all sorts of hardy garden flowers, in bunches or otherwise, so as to have wide interpretations and as few annoying limitations as possible. Bulbs, I take it for granted, have been by some judges excluded from the term "perennial" because in most, if not in all, cases, the old bulb dies with the plant growth yearly, and a new one is formed. Hence bulbs cannot be regarded as perennial in the same sense that *Delphiniums* or *Phloxes*, which are herbaceous; or *Pansies*, *Pinks*, or *Carnations*, that are purely perennial. With reference to the size of the bunches shown, that is a matter of some importance, although in the estimation of good judges quantity cannot excel quality. Still some bunches are largely overdone. Mr. Shanks' suggestion as to the limiting the size of the receptacle or holder of the bunches is a good one, and if not permitted to exceed 2 inches in diameter I think that would be found large enough for all useful or decorative purposes.—A. D.

I BEG to thank those of your readers who have kindly given us their views on the above subject, and trust before the discussion

ends some definite rules may be adopted for showing and judging hardy flowers to the satisfaction of all concerned.

I most gladly agree with the Editor that we drop the technical terms "herbaceous" and "perennial," and thank him for suggesting the broader term "hardy border flowers." We might even go a step farther, and drop the word "border," and reduce it to "hardy flowers." As the Editor observes, it has the merit of simplicity, and has a good old-fashioned ring with it. Disposing thus of "herbaceous" and "perennial," we should not be exposed to the vexatious "disputes and wrangles" that have, unhappily, more than once disturbed our peace and destroyed our pleasure at an exhibition. The term "hardy flowers" would, of course, require the proviso respecting annuals and shrubs.

With regard to the question of hardiness, raised by "B." (amateur), I have little or nothing to say beyond this—that in my somewhat lengthened experience it has scarcely ever seriously cropped up. The only flowers that I have had any trouble with on that score are *Liliums Browni*, *Harrisi*, and *auratum*; and though they are hardy, and can be successfully grown in the open in most parts of England, the judges in each case decided against them, and I hold the decided opinion that they were in each case grown in pots inside. It was with a remembrance of these instances that I asked if flowers grown indoors should be allowed to have points over those grown in the open. The best way out of the difficulty is, I think, to adopt "B.'s" suggestion, and exclude hardy plants grown in a house, for though a hungry pot-hunting exhibitor (if there be such a person) might stage examples grown indoors, he would not be likely to introduce the best that could be produced, and they might not often turn the verdict in his favour. In ninety-nine cases out of one hundred, I venture to say, the exhibits would be honestly produced out of doors.

The Rev. F. Page-Roberts says he would not allow full points for the varieties of one kind in a small collection. Well, I candidly confess if the stands were in other particulars equal I, too, should be inclined to withhold points, and yet I can see a probability of extra colour being gained by using two of one kind, that might recover the lost "points." In any case I should not suggest showing distinct kinds, and for this reason many of the most popular groups of hardy flowers differ in every important particular, in form, habit, colour, time of flowering, &c., that equal skill is required to creditably stage two varieties of one kind as two of dissimilar kinds. We have in *Liliums* a diversity of form, colour, and habit, likewise in *Gladioli*, *Campanulas*, *Papavers*, *Iris*, *Spiræas* and *Lychnises*, and these are only a few examples of the many that might be cited. In view of this does it not appear that distinct varieties, rather than distinct kinds, would be acceptable to the large body of exhibitors? What objection can there be to *Delphiniums Minerve* (double), *Belladonna* (single), and *nudicaule* (bulbous) appearing upon one stand?

I am glad your correspondent "Y. B. A. Z." recognises the desirability of restricting in some manner the size of the bunches, though I scarcely think the method he suggests likely to afford the best results. There are so many beautiful hardy flowers that would make no show whatever if the bunches were restricted to five stems each. At the same time, I, too, would rather see, say, a fine spike of *Phlox* by itself than the same spike crowded until it loses its individuality in a mass. I still think that to stipulate the size of the tubes would be the most likely method of bringing exhibitors on to a level footing. "Y. B. A. Z." must not be carried away with the idea that a shilling or two of expense will deter any enthusiastic exhibitor from staging his products in the most suitable manner. Zinc or tin tubes of sufficient size could be purchased in almost any village or town at from 1s. to 2s. per dozen. There is another method that suggests itself as likely to restrict the dimensions of the bunches—i.e., to allow collections of a given number of varieties a given space, but would this not in many cases tend to crowding, and thus destroy every characteristic of the examples staged?

I do not know what I may add to the foregoing. I should be glad if Mr. J. A. Williams' suggestion could be acted upon at once and a society or committee formed to frame rules and regulations for our future guidance. Will Mr. Williams take the initiative? Will he, in the interests of "hardy flowers," "call" together those he mentions in his notes, and have the formation of a society discussed? The Editor, I feel certain, would offer us every facility, by reporting meetings and publishing our notes, and many lovers of "hardy flowers" would most gladly assist once a society was formed.

Meanwhile, may I ask how the following wording for schedules would answer?

For twelve bunches of hardy flowers (grown in the open), distinct varieties (shrubs and annuals excluded), bunches to

be staged in tubes or glasses not exceeding 1 inch in diameter.—E. R. SHANKS.

[May we suggest that the word "kinds" be substituted for "varieties" in a class for twelve bunches; and in a class for twenty-four that two distinct varieties of a kind be admissible? With the significance of the terms "kinds" and "varieties," as fully recognised in flowers as is the case with fruits, as it ought to be, misunderstandings would be reduced to a minimum. In a class for "twelve dishes of fruit, distinct varieties," an exhibitor would be within the terms if he staged four distinct varieties of Apples, Pears, and Peaches; and in a class of "twelve distinct varieties of hardy flowers" the terms would similarly admit four distinct varieties of Carnations, *Delphiniums*, and *Gladioli* (or any other flowers). "Kind" is the popular equivalent for "genus," and for purposes of simplification species may well count as varieties in exhibiting. With the amendment proposed we think our correspondent's sample class would be the best up to date. What do others say, including Mr. Shanks?]

TILLANDSIA CARINATA.

A BEAUTIFUL object at present in flower in the stove is this charming *Tillandsia*, or, as it is called, *Vriesia brachystachys*. It was introduced from South Brazil in 1866, and it seems a pity that it is not more generally grown. The flowers rise to a height of 5 or 6 inches, are borne on slender stems, and are nearly fan-shaped, the upper portion being of a pale yellow, and the base deep scarlet, and appearing as if they had been varnished. Of their lasting properties one cannot speak too highly, for we have them in flower for two or three months—in fact, it seems as if the flowers could scarcely fade. Pretty as they are when dotted amongst the stove plants, they are equally so for house decoration, the colour of the flowers showing up admirably by gaslight.

As regards its culture it is not at all fastidious as to what compost is used. Propagation is easily effected by suckers at nearly any time of the year, but I prefer February or March, as then the plants get a favourable season of growth. The compost we use is composed of three parts good fibry loam, making the remaining part up of old mortar, leaf mould, and coarse sand. If the pots are well drained, and as soon as the plants get established, they will stand sunshine, heat, and moisture with impunity, and during the summer there need be no fear of syringing the plants. In the winter time they can be kept much drier, and this is one important point where a large number of plants are used for decorative purposes. It is astonishing what a pretty effect plants in 4 or 5-inch pots and carrying four or six flowers have owing to their rich colouring.—R. P. R.

THE TITS AND THEIR HABITS.

ALTHOUGH, unfortunately, I have not the *Journal of Horticulture* of the 1st inst. to refer to in reply to correspondents individually, who kindly replied to my inquiries respecting the reference made to blue tits and their bud-destroying and bee-killing tendencies, I must thank them for their courtesy in stating their views, none the less because we do not all agree, and it appears are not likely to. I was pleased to learn from Mr. Harrison Weir that the blue tit feeds on Thistle seeds. I have very frequently seen the marsh tit busy on Thistles, scattering the feathery down to the autumn winds, but cannot call to mind any instance of noticing either of the other species.

The question arises in my mind, Do birds vary in their habits in different localities? No one, I imagine, has a better chance to watch them than I have, as I encourage them to build and roost in the most unnatural and grotesque positions imaginable for the amusement and instruction of the young friends who come to see the birds and their nests at "The Wren's Nest" in summer; and at evening parties in the winter I have frequently shown Master Tommy enjoying a night's lodgings in an old boot, a tin teapot, a Tomato tin, or other amusing situation. They have their faults in pecking fruits, and it is very annoying sometimes to find the best specimens spoiled for keeping, but they are generally fit for use, and if too many are injured for present requirements Apples might be evaporated, and Pears bottled, as recently explained in the *Journal* (page 481), so that the actual waste is not worth naming.

Parus major is very destructive to Peas in the pod, and I have no hesitation in saying that I have felt obliged to trap or shoot many in this respect, as also sparrows, hawfinches, and jays, or I should have had none left for table. *Parus major*, commonly known locally as "Tom Collier," is also particularly fond of bees, but I have never been able to discover one killing my bees. I have watched them picking up the cramped, practically dead bees from the snow and from the cold ground, carry them off to a tree or to a clod, place them under their feet, and pull the bees asunder and take out some small portion from the abdomen, and discard all else; but the "blue tit," *Parus minor*, the species referred to, I have never seen once attempt to molest my bees.

A little incident may be worth recording respecting a disputed point on their fruit-bud destroying propensity. I was at Evesham some years ago at a conference of fruit growers, when the same question arose, I contending they were taking pests from the buds, and others that they were attacking the buds for food. Of course no decision could be arrived at, and mere contradiction was useless to prove the point. When at home I concluded to watch my opportunity and shoot one or

more which were busily feeding on my Damson trees "in the very act." I opened one, took out the contents of its stomach, spread it on card-board, where it is now, with the result that not a particle of a bud could be found, but on the contrary it was stuffed full of insect pests of various sorts, particularly brown scale and aphides.—J. HAM.

THE WEATHER IN LONDON.—During the past week the weather has been unusually mild in the metropolis for the time of year. Sunday was mild and dry, but rather windy, similar weather continuing Monday and Tuesday. Wednesday opened fine and dry, but at the time of going to press it is foggy.

WEATHER IN THE NORTH.—We have had no frost since the morning of the 15th, and snow has disappeared from the low grounds, and patches only are seen on the hills. The days of the past week have been generally good, though dull, with occasional drizzle, and high winds have occurred, especially during the nights.—B. D., *S. Perthshire*.

ROYAL HORTICULTURAL SOCIETY.—The next meeting of this Society will take place on Tuesday, January 17th, and not the 14th, as printed in our last issue.

SCHOLARSHIPS IN HORTICULTURE.—At a meeting of the Court of the Worshipful Company of Gardeners, held on Monday, December 19th, at the Cannon Street Hotel, the scheme of examination in horticulture lately set out by the Royal Horticultural Society was brought under discussion, and it was decided that the Company should offer a scholarship of £26 a year, tenable for two years, to be awarded after the examination to the most successful candidate under certain conditions. It was also announced that a second scholarship of the same value was offered by the President of the Royal Horticultural Society, Sir Trevor Lawrence, Bart., and it was hoped that others might follow such good examples. The exact conditions of the scholarships have yet to be settled, but the main provisions will be that the holders shall be between the ages of eighteen and twenty-two years, and that they shall study gardening for one year at least at the R.H.S. Gardens, Chiswick, and for the second year either there or at some other place to be approved.

THE ROYAL HORTICULTURAL SOCIETY AND ITS COMPETITIONS.—The announcement made to the Fellows of the Society on the part of the Council that it is proposed to hold three great exhibitions next year, it is hoped signifies that the few classes with prizes attached furnished at most of the fortnightly meetings will not again figure in the schedule. These have been miserable failures, the awards sometimes going to exceedingly poor exhibits, whilst at times there were none whatever. If at these shows liberal prizes are offered some good competitions may be looked for. The Temple Show will fall on May 25th and 26th. There will be one at Chiswick on July 11th; and surprising as a new departure, one at the Agricultural Hall, Islington, on August 29th to September 1st. That will, indeed, be a big experiment, for which every success is hoped. The good prizes awarded at the Earl's Court series of shows evidenced the power of money in attracting exhibitors. If but £500 be offered in prizes at the Agricultural Hall a grand Show may result.—D.

HORTICULTURAL CLUB.—The usual monthly dinner and conversation was held at the rooms of the Club, Hotel Windsor, Victoria Street, on Tuesday the 13th inst. There was a large attendance of members. The chair was occupied by Mr. Harry Veitch, Vice-Chairman of the Club. Amongst those present were the Revs. W. Wilks, F. R. Burnside, and F. H. Gall; Messrs. John Lee, H. J. Pearson, Alfred H. Pearson, John S. Cousens, J. Burrell, Geo. Bunyard, Joseph Cheal, Geo. Paul, W. J. Jefferies, W. H. Williams, Harry Turner, &c. The discussion was on growing Chrysanthemums for exhibition, opened by an able paper by the Mayor of Taunton (W. Herbert Fowler, Esq.), who was unable to be present. The paper (see page 543) was read by Mr. Alfred H. Pearson, and was received with much interest, and elicited a very profitable discussion. Two fine boxes of Chrysanthemum blooms from Mr. Blair (gardener to the Duke of Sutherland at Trentham) were, through the good offices of Mr. Harry Turner, sent to illustrate the lecture. The next meeting of the Club will be held on January 17th

HEREFORDSHIRE FRUIT AND CHRYSANTHEMUM SOCIETY.—We are informed that the second annual Show of this Society will be held at Hereford on November 15th, 16th, and 17th, 1893.

ROYAL BOTANICAL SOCIETY OF BELGIUM.—We are informed that M. Em. Rodigas, the Director of the National School of Horticulture of Ghent, has been elected President of the Society.

GOVERNMENT TREE PLANTING IN IRELAND.—We learn that large orders for trees have been sent to Messrs. Dicksons (Chester), by the Irish Land Commissioners for planting on the west coast of Ireland.

IMPORTED FRUIT.—According to the Board of Trade returns for November 901,959 bushels of Apples and 19,268 bushels of Pears were imported into this country during that month. In addition to this Oranges, Lemons, Grapes, and other fruit were imported in bulk.

CONIFERS AND TAXADS.—We have received a list of Conifers and Taxads cultivated in the open air in Great Britain and Ireland by Dr. Maxwell T. Masters, F.R.S. The list has been reprinted from the Conifer Conference Report issued a short time ago by the Royal Horticultural Society, and is valuable as a work of reference.

HORTICULTURE IN IRELAND.—The Lord Lieutenant of Ireland was recently presented with an address by the members of the Royal Horticultural Society of Ireland. In reply, his Excellency said the study and practice of horticulture would lead to the promotion of an industry which would be of great importance to the country.

ROYAL CALEDONIAN HORTICULTURAL SOCIETY.—Several shows are arranged to be held during the coming year, under the auspices of this Society. The spring Show takes place on April 5th and 6th, the summer Exhibition on July 12th and 13th, and another on September 13th and 14th. All will be held in the Waverley Market, Edinburgh.

A LATE AMERICAN MILLIONAIRE AND FLOWERS.—It is not generally known that the late Jay Gould, the American millionaire, loved flowers. He knew the names of every plant in the vast greenhouses at his country place, and botany was almost his only recreation. Not many months ago he had a most elaborate conservatory erected at an enormous cost.

THE NURSERY AND SEED TRADE ASSOCIATION, LIMITED.—The annual dinner of this Association was held at the Guildhall Tavern, Gresham Street, recently. The President, N. N. Sherwood, Esq., presided, and was supported by a number of members, amongst them being Mr. H. J. Veitch, Mr. H. Turner, and Mr. W. Paul. The vice-chair was taken by the Treasurer, Mr. W. J. Nutting.

WAKEFIELD PAXTON SOCIETY.—At a recent meeting of this Society, Mr. Hudson of Sandal Grange Gardens gave a paper on "The Apple." Alderman Milnes presided, and the vice-chair was occupied by Mr. H. S. Goodyear. The paper proved to be exceedingly interesting, and a long discussion followed. A case containing male and female specimens of the winter moth was shown by Mr. G. Parkin.

A NEW LUMINOUS FUNGUS has been forwarded to Europe from Tahiti. It is said to emit, at night, a light resembling that of the glowworm, which it retains for a period of twenty-four hours after having been gathered, and it is used, by the native women, in bouquets of flowers for personal adornment in the hair and dress. It belongs to the section "dimidiati" of the genus *Pleurotus*, in which no luminous species has been hitherto known, although there are several in the genus, and has been named *Pleurotus lux* by M. Hariot. It is believed to grow on the trunks of trees.

ARAUCARIA IMBRICATA.—I have noticed on several occasions where a flower bed surrounds an Araucaria that the latter is invariably bare of branches at the bottom. I was visiting a place a few years ago where there were two large specimens of this Araucaria growing on the lawn, each in the centre of a small flower bed. The bottom branches had died off a distance of several feet up the stem, but the gardener assured me that previous to the flower beds being made both trees were branched to the ground. It seems a pity that such a beautiful tree should be so disfigured for the sake of a flower bed. This tree evidently do not like its surface roots disturbed. Not far from the two trees referred to is one of the finest specimens in Yorkshire, growing on a lawn. The bottom branches rest on the ground, and the tree is copiously watered with liquid manure during the summer, and it apparently appreciates such treatment.—C. RUSSELL.

— **A VINE DISEASE.**—Dr. B. Pasquale has undertaken a study of the phenomena and causes of the very destructive disease of the Vine known as "mal nero," his observations having been made chiefly in Sicily. The disease makes its appearance in the form of black spots and streaks on the leaves. Dr. Pasquale finds it to be always accompanied by a Schizomycete, which he believes also to be its cause, and which is parasitic, especially on the tissues rich in protoplasm and in other plastic substances, such as the cambium, the medullary rays, the cortical parenchyma, and the soft bast of the axile organs.

— **THE MIDLAND COUNTIES CARNATION AND PICOTEE SOCIETY.**—The second annual report of this Society just issued is of a very satisfactory character, showing an income for the year, including a balance from last year, of £188. With an expenditure of £90 in prizes, and donations of £5 each to the Gardeners' Benevolent Institution and the Gardeners' Orphan Fund, there is still a balance in hand of £32. The report is comprehensive, and contains much information of a useful character to amateurs, as full lists of flowers exhibited in the winning stands are given, together with a reliable list of each class of the best varieties for cultivation, comprised from lists sent in by several of the leading cultivators in the Midlands.

— **EFFECTS OF THE ELECTRIC LIGHT ON PLANT GROWTH.**—The "Botanical Gazette" states that, in a report to the Cornell University, Prof. L. H. Bailey firmly establishes the commercial value of the electric light for certain winter crops, especially for Lettuce. Certain kinds of plants, which are injured by the direct rays of the light, are not injured, but may even be benefited, when the light passes through a clear glass globe or through a glass roof. Auxanometric records appear to show that the light accelerates growth, but does not change its normal periodicity. This is in harmony with the observations of Prof. G. Bonnier, recorded in the "Comptes rendus," who finds that the electric light promotes the formation of chlorophyll in all kinds of plants, both woody and herbaceous.

— **CARDIFF HORTICULTURAL SOCIETY.**—The annual general meeting of the above Society was held on Wednesday, the 14th inst., and there was a good attendance. In the absence of Mr. A. Pettigrew of the Castle Gardens, Mr. John Morgan took the chair, and in his opening remarks stated that the Society had this year been able to pay off a good sum of the existing debt due from last year. There was an increase of subscriptions, but a large falling off in gate receipts, due to the rain on the second day of the Show. The entries exceeded by 200 those of last year, and were in every department of much greater merit, and there was no doubt the Society had now established a reputation. The Mayor of Cardiff was elected President, Mr. J. D. Morgan Chairman of Committee, with Mr. Stephen Treseder of the Pwllcoch Nurseries, Vice-Chairman. Mr. H. Gillett was re-elected Secretary. The next Show was fixed for the 15th and 16th August.

— **LIVERPOOL HORTICULTURAL ASSOCIATION.**—The second lecture of the fourteenth series of winter readings was held in the Free Library on Saturday evening last. Mr. White presided over a well-attended meeting, and introduced the lecturer, Mr. Harrison, gardener to Lord Derby, Knowsley Hall, as a well-known authority on the subject he had chosen—viz., "Ornamental Trees and Shrubs." Mr. Harrison treated his subject thoroughly, comprehensively, and admirably. A discussion followed. Mr. Ranger advised all young gardeners to let their first aim be to gain a thorough knowledge of trees and shrubs, and when making a plantation to plant carefully all those required for a permanency, and all delicate ones to be protected with other trees until well established, afterwards to be cut away. Mr. Ker pointed out how easy it was to stock a conservatory and make it ornamental; but in planting a shrubbery it required great foresight, as it would take many years to see if the work had been well done. Votes of thanks to Mr. Harrison and the Chairman terminated the proceedings.—R. P. R.

— **BOY GARDENERS.**—Amongst the various incidents that have cropped up in connection with the courses of horticultural lectures in the county of Surrey, I have met with none more interesting than is found in the regular attendance at one place of a number of strong, hearty, bright, intelligent lads from the Gordon Boys' Home. These form capital material for the making of future garden labourers, and in time something much better. They are not gutter lads, but of a much superior kind; and that intensely sharp, precociously cunning look which characterises lads in a reformatory school is altogether wanting—happily so. These lads come to the lectures under the charge of the gardener and bailiff to the Home, Mr. Hale, a most intelligent man, and who it is certain will do his best to make these lads capable

and useful. He would be only too pleased to obtain for them from time to time situations in gardens, and I should regard them as trained so far to make capital helpers.—A. D.

— **DEATH OF MR. WILLIAM PRATT.**—It is with much regret that we record the death of Mr. William Pratt, lately head gardener to the Marquis of Bath, Longleat, Warminster, which took place on the 12th inst. at Southgate Hotel, Southgate Street, Bath, where the deceased had been carrying on the business of wine and spirit merchant for three or four months. During the nine or ten years that the late Mr. Pratt was at Longleat he distinguished himself a most successful Grape grower and a thoroughly good all-round practical gardener. Mr. Pratt was forty-two years of age at the time of his death, and he leaves a wife and young family to mourn his loss. Previous to taking charge of Longleat Gardens the deceased was several years gardener to Lord Hill, Hawkstone, Shrewsbury, where he distinguished himself in the culture of plants and other things.

— **EAST ANGLIAN HORTICULTURAL CLUB.**—A pleasing feature in the proceedings of the annual general meeting of this Club, held at their headquarters, the City Arms, Norwich, on Wednesday, December 14th, was the presentation of an enlarged framed photograph of himself to Mr. F. Morris, The Gardens, Witton House, than whom no member is more justly appreciated in every way. Mr. Morris was again elected President, for the fourth year in succession; Mr. H. N. Bartlett, The Gardens, Earlham Hall, was elected Vice-Chairman in place of Mr. Barnes, while the latter gentleman and Mr. Bracey of Thorpe were appointed his deputies for the ensuing year. Mr. Charles Daniels was chosen as Hon. Treasurer in lieu of his brother Mr. George Daniels, who has resigned, to the regret of all the members. Mr. A. F. Upstone, of Messrs. Daniels Bros., was for the third time asked to undertake the onerous duties of Hon. Secretary. The Committee were almost to a man re-appointed. About sixty members were present.

— **GENERAL RULES OF THE CLUB.**—We publish the following rules of the above Club, passed at general meeting, January 13th, 1892, as they contain good points, and may be suggestive. 1, That this Club be called "The East Anglian Horticultural Club." 2, That the Club shall be for the advancement of horticulture, and for promoting a friendly and social intercourse amongst its members and their friends, and that political and religious subjects shall not be discussed at any of the meetings. 3, That there shall be a President, two or more Vice-Presidents, Treasurer, Secretary, and a Committee of eighteen members, seven of whom shall form a quorum. 4, That the President, Vice-Presidents, and Treasurer shall be ex-officio members of Committee, and shall retire annually, but shall be eligible for re-election. 5, That six of the Committee shall retire annually, but shall be eligible for re-election. 6, That the Club shall consist of two classes of members, honorary and ordinary; that the annual subscription for the former be not less than 10s., and for the latter 5s., and for under gardeners 2s. 6d. Ordinary members' subscriptions shall become due on the 1st of January, and if not paid by the second Wednesday in July the defaulter shall cease to be a member, and forfeit all privileges of the Club. 7, That all persons wishing to become members must be proposed on forms or nomination papers, provided by the Club, and elected at the next meeting; the proposer to pay a fee of 1s. at the time, such sum to go towards the general expenses. 8, That a portion of any surplus money at the end of each year may be used for benevolent purposes, to be administered as the majority of the Committee may deem advisable, and whose decision in all matters relating thereto shall be final. 9, That a free register of gardeners out of employment, or in want of situations, shall be kept, so that members desirous of assisting their brother gardeners to obtain situations may find a valuable aid therein. All members are therefore requested to co-operate in this, by making known to the Secretary their wants; also to give information of any situation which they know is vacant or likely to become so. 10, That members may introduce friends at any of the meetings, and that a visitor's book shall be kept, which must be signed by both visitor and member on the evening of introduction. 11, That meetings be held monthly, at 6.30 P.M., on the second Wednesday in each month. 12, That a banquet be held each year, on the first day of the Norfolk and Norwich Chrysanthemum Show, each member paying for his own ticket. It is thought by adopting this plan there will be a surplus for benevolent purposes and for other objects the Society have in prospective. 13, That these rules shall remain in force till the end of the year, and no alterations be made except at the annual meeting. One month's notice must be given in writing to the Secretary of any proposed alterations.

— **MORE YELLOW ARUMS.**—Since last I sent you a note about these plants, though only about a fortnight has elapsed, yet in that short space two more forms have quite unexpectedly been offered for sale to the public. The first of these is sent out under the name of *Richardia aurata*, and is a hybrid between *R. albo-maculata* and *R. hastata*, raised by the well-known French hybridist Monsieur J. B. A. Deleuil, of St. Anne, near Marseilles. The second has been sent by a collector from the neighbourhood of Lake Nyanza, under the provisional name of *Pride of the Congo*, and is said by the sender to be a very handsome form of the Golden-spathed Arum. About a hundred tubers of this plant were sold by public auction on Wednesday last by Messrs. Protheroe & Morris, and fetched comparatively low prices, realising only between £60 and £70 for the lot. I think that when these plants bloom in the course of next year that the hybrid of M. Deleuil will probably turn out to be either identical with the form now known as *Ellioti*, or, if not, then closely resembling it, and that the so-called *Pride of the Congo* will be what is now known as *Pentlandiana*. It seems that it is botanically incorrect to call these plants *Calla*. Their only correct name is *Richardia*, and the proper specific designation of the common type form is *R. africana*, and not *R. æthiopica*, as it is generally called.—BOSCOBEL.

— **MODERN GREENHOUSES.**—I was very pleased when perusing the practical paper, read recently by Mr. Roberts at a meeting of the Preston Horticultural Society, to especially observe his pithy remarks regarding the construction of many modern greenhouses. I agree with him that at the present day they are built far too light, and consequently airy, for many plants. The one idea seems to be lightness and elegance, both necessary to a certain degree, but plants require moisture as well; modern and elaborately tiled houses are much too dry. Light, of course, is necessary—it is the great consolidating agent, but due regard must be had when building houses as to what plants are to be grown, and constructed accordingly, not sacrificing conditions essential to their well-being in straining after showiness. Many architects' conservatories and greenhouses are torments to plants and gardeners alike.—J. J. C.

— **A PRETTY NEW DOUBLE ZONAL PELARGONIUM.**—At the last meeting of the Birmingham Gardeners' Association, Messrs. Cannell & Sons, Swanley, Kent, sent some blooms of their new variety "Double New Life," and the pedigree of this variety is given in a few words. The old familiar bedding Zonal *Vesuvius* was raised about 1866 by the late Mr. Windebank, a well-known nurseryman at Southampton, and was introduced by Messrs. F. & A. Smith, then a well-known firm at Dulwich. This variety often "sported," producing white, pink, and salmon varieties, and recently the pleasing single variety of *New Life*, as well as the old double variety "Wonderful," and from this double scarlet variety we now have Messrs. Cannell's "Double New Life," which appears to take the character of *Wonderful*, but the flowers are very distinctly flaked with bright scarlet and clear white.—W. D.

— **PRIMULAS AT KEIGHLEY.**—I have had the pleasure of inspecting a very fine display of remarkably well grown plants in one of Mr. J. Carter's houses, a span-roofed structure 60 feet long and 12 feet wide. It was filled with double and single varieties. Among the doubles were *White Lady*, *Marchioness of Exeter*, white flaked red; *Princess of Wales*, white well fringed; *King of the Purples*, large; *Purple Perfection*, very good; *Rosea superba* (new), a very pleasing rosy purple; *W. H. Parker* (new), deep red; *Lord Beaconsfield*, *Peach Blossom*, and *Fairy*. The Old Double White is grown well, but is excelled by *White Lady* and *Princess of Wales*. Amongst the semi-doubles, *Mrs. Langtry*, flesh colour; and *Miss Edith Parker*, white flaked red, were very good. The singles were magnificent, some of the blooms measuring 2½ inches across, and of immense substance. The best of these were *Princess Louise*, white; *The Queen*, white; *Marquis of Lorne*, rosy purple; *Emperor*, salmon red; and *Dark Red*, deeper than *Chiswick Red*, and very striking.—P. R. T.

— **WOOLTON GARDENERS' MUTUAL IMPROVEMENT SOCIETY.**—On Thursday evening last, at the Mechanics' Institute, Woolton, T. Lewis Bailey, Esq., gave the last of his lectures, which have been held under the Lancashire and Cheshire University Extension Association. The lecturer treated in a thorough manner on "Manures: what they are, their classification, natural and artificial, how and why they affect plant life, and their analysis." Throughout the course the lecturer has gone on the lines that his hearers have had no previous chemical knowledge,

consequently the lectures have been strictly rudimentary. They have proved far more valuable, too, owing to the experiments and the excellent lantern slides which have appeared on the screen. It will be no fault of the Committee connected with this Society if the Woolton gardeners do not take high rank in the near future, for they have already announced a course of six lectures on botany, the first commencing on January 26th. The Hon. Secretary, Mr. Wm. Dizley, works hard to keep everything up to date.—R. P. R.

— **TULIPS IN AN IRISH GARDEN.**—Few amateurs strive for completeness in anything taken up so thoroughly as Mr. W. G. Gumbleton. He has long devoted considerable attention to early Tulips, and this season has planted nearly 4500 bulbs, in all the choicest and best varieties. One large border is planted in forty-four contingent circles of *Saxifraga Camposi*, the Tulips being in dozens, and all very carefully arranged as to height and colour; and half dozens of other choice varieties are planted in the centre of a set of small beds. Besides these there are twenty-three beds, the number of bulbs in each varying from forty-eight to 170. Mr. Gumbleton has favoured me with lists of the varieties he has planted, and it is clear from them that he has spared neither care nor expense to get the very finest in cultivation. Such sorts as *Queen of the Netherlands* and *Pink Beauty* will interest by their novelty, as well as charm with their beauty. There can be little doubt that in the spring Belgrove will be a Tulip lover's paradise.—W. P. W.

— **THE MIDLAND COUNTIES GARDENERS' ASSOCIATION.**—At the meeting of the Association on the 12th inst., Mr. H. Cannell, Swanley, Kent, contributed a paper on "The Rose," and in his opening remarks strongly recommended great care being exercised in lifting Roses from the ground, so as to preserve every root, and advised careful packing. He pointed out the too common practice of digging a small hole in planting and using fresh manure from the stables, which he condemned. He urged using good loamy soil if possible and rich manure not directly on the roots. He especially emphasises the necessity of the roots being kept damp in transit and not allowed to be exposed, and get dry before planting. Messrs. Cannell & Sons sent specimens of their fine strain of *Cyclamens* and a superb bloom of a new Japanese *Chrysanthemum*, *Mdlle. Marie Recoura*, pure white, resembling *Puritan* and *Stanstead White*, a very late bloomer, with fluted tubular petals, and presumably not so subject to damp as some whites; also blooms of their new Zonal *Pelargonium* "Double New Life." Messrs. Vertegans & Co. exhibited ripe fruit of *Diospyros Kaki*. Messrs. Thomson & Co. contributed a fine bloom of a scarlet self seedling hybrid *Margaret Carnation*, the plant raised from seed in February last, and has been in bloom since August.

THE GARDENERS' ROYAL BENEVOLENT INSTITUTION.

A GENERAL meeting of this Institution was held at Simpson's, 101, Strand, on Tuesday, December 20th, to consider the advisability of confirming new rules drawn up by the Committee, making various alterations in the old ones, and changing the title of the Institution from its original designation to that under which it is now generally known for the purpose of registration. H. J. Veitch, Esq., the Treasurer, occupied the chair, and he was supported by Mr. Pocock, honorary solicitor for the Institution, Mr. John Lee, and Dr. Hogg. There was a large attendance of subscribers, and amongst those present were Dr. Masters, Messrs. N. N. Sherwood, Owen Thomas, A. F. Barron, J. Laing, G. J. Ingram (Secretary), and others.

The Chairman, in a few opening remarks, said that a short time ago the Committee of Management thought it was desirable to change some and make various alterations in other rules. Mr. Pocock, their solicitor, was consulted on the matter, and he said that it was a very delicate subject, inasmuch as they would have to work under the Friendly Societies Act of 1875. When the rules were originally drawn up the investment laws were very strict, but since then various Acts of Parliament had been passed, and the Committee thought it was advisable to avail themselves of the full advantages if they had any money to invest. The old rules, except one, were all incorporated in the new rules, and would meet the requirements of the time. After much discussion, many new rules and sub-sections and alterations were passed.

Dr. Hogg, after the alterations and additions were adopted, moved a proposition to the effect that the now existing rules be the rules of the Institution. Dr. Masters seconded, and the proposition was carried unanimously.

A vote of thanks to the Chairman and to the Solicitor concluded the proceedings.

WORTH PARK.

WORTH PARK, the country residence of Mrs. Montefiore, stands amidst rather flat, but beautifully timbered surroundings, about a mile north of Three Bridges Station on the main London, Brighton, and South Coast Railway. It is approached from the Crawley and East Grinstead road by a broad substantially made carriage drive, winding through ornamental pasture land, while nearer the mansion it assumes the form of a fine straight avenue planted with Limes of a dozen years' growth. In front of these, on a broad grass margin, are clumps of Rhododendrons and other flowering shrubs.

On arriving at the gardens, which are situated a little to the right of the drive, we were welcomed by Mr. Glen, Mrs. Montefiore's able gardener, who conducted us over the extensive range of forcing houses. To the north of the main range are several long ranges of pits. One of these was filled with Violets, Marie Louise and Swanley White being favourite sorts. In others were a large stock of Bouvardias, promising abundance of bloom during the winter. A large quantity of the useful Arum Little Gem is being worked up, while other pits were occupied with Primulas and various winter flowering-plants. Loxford Hall Seedling Strawberry is much valued here, one of the pits being planted with it, and at the time of our visit (the last week of September) there was still some fruit on the plants.

We now enter a range of span-roofed houses, recently extended, and

houses, were stripped of their sashes, the wood of the trees showing well for another year's work. To the left are lean-to vineries. The first is an intermediate house, originally Hamburgs, but now being worked with Alicantes and Gros Marocs, more to be depended upon for late autumn supplies. The early house in the centre is filled with Chrysanthemums in their season. The third division is a Muscat house, and the Vines were carrying a crop of useful sized bunches.

We are next invited to inspect the cordon Pear wall. This is over 500 feet long, has a west aspect, and all the leading sorts are represented and doing well. Considering the great number of varieties grown the trees have made fairly even progress; what few breaks there are have been made by a judicious weeding out of inferior sorts. The present not being generally a good Pear year it may be of interest to name a few that have cropped well. These are: Marie Louise d'Uccle, Louise Bonne of Jersey, Beurré d'Anjou, Beurré d'Aremberg, Winter Nelis, Thompson's, General Todleben, Pitmaston Duchess, Madame Treyve, Beurré Hardy, Baronne de Mello, and Vicar of Winkfield. A hurried glance at the crops in the kitchen garden speaks of its good cultivation. About fifty persons have to be duly supplied with vegetables, a task which must entail no little forethought and anxiety. In a south border we observed that a breadth of Dwarf Beans that had been exposed to the frost of the morning of September 18th were being nursed into growth again under a covering of sashes. We now come to another range of pits in which were different sowings of Dwarf Beans coming on to

FIG. 73.—WORTH PARK, SUSSEX.

the old part new roofed. The centre house is a wide span, one division is occupied with a healthy collection of stove plants—Crotons, Dracenas, Cocos Weddelliana, and other Palms in a small state are grown extensively for decoration; while the roof is thinly covered with Allamandas flowering profusely. The other division is devoted to Roses; the leading Tea and Noisette varieties are planted out, and supported by stakes. Two divisions of the adjoining range are devoted to Carnations. Malmaisons and Miss Jolliffe are grown by the hundred; Winter Cheer, Mrs. Moore, Lucifer, and Sir C. Wilson are also grown. Here also is a small collection of Orchids, conspicuous amongst them being some huge pans of *Cœlogyne cristata* already showing some hundreds of flower spikes.

Next we come to a Melon house, bearing the last crop of the season; the remaining house being occupied with greenhouse plants. Some small beds at the end of the stove are planted with Celosias. They were very fine, and are likely to get a fair trial as bedding plants another year. Adjoining are ample shed accommodation with useful arched cellars underneath suitable for storing roots and making Mushroom beds. A fine lofty fruit room, fitted all round, and in the centre, with fixed shelves and sliding trays between each, giving double storage in the usual space. There is also a well-fitted Grape room, a good office, and equally comfortable rooms for the young men. We next visit the Fernery, a long lean-to with north aspect. The back wall is covered with Maidenhair Ferns, giving an endless supply for cutting. Amongst the plants on the front stage were arranged a first batch of Poinsettias, of which some 400 are grown annually.

On entering the kitchen garden to the right are the Early Peach

succed those just mentioned. Other pits were filled with Gardenias and Poinsettias in fine condition. In a frame were some hundreds of this year's seedling Begonias planted out. These were being sorted into colours for future bedding as they come into flower. The strain is Veitch's, and is fine. Then we enter the late vinery, which is mainly occupied with Lady Downe's, but a few young Vines of Muscats are bearing some splendid bunches. Two late Peach houses are furnished with fine clean healthy trees.

Still another range of houses have to be inspected, having been recently rebuilt. They are for Melons and Cucumbers, and are now all that could be wished for early forcing. One of the divisions is devoted to Cucumbers for a supply during the autumn. In the next house are some fine healthy Cypripediums, and in a third a batch of Celosias for winter decoration. In front of the Vine borders were some Strawberries in pots, about 2000 sturdy plants. Viscountess Hericart de Thury, President, Sir Charles Napier, and James Veitch are the sorts depended upon.

Crossing the carriage drive we enter the Camellia corridors. This structure is rather a novelty. It is 400 feet long, about 8 feet wide, has a span-roof of tiles, and the west front of it is glazed with very large squares of plate glass. The back wall is covered with Camellias, which do fairly well, but no doubt, as pointed out by our guide, they would make shorter-jointed, better ripened wood if the west side of the roof, as well as the side, were glazed. This pleasant promenade forms the eastern boundary to the Dutch garden, a prettily laid out geometrical design, with a fountain in the centre. Here, as also on the terrace round the house, Begonias have quite taken the place of Pelargoniums for

summer bedding, twenty-seven beds having been planted this year. The mansion stands on a broad handsome terrace 260 yards long. A number of beds here were planted with Madame C. Desgrange Chrysanthemum on a groundwork of dark Heliotrope with pleasing effect. A large bed at the north-west corner of the terrace planted with Cannas surrounded with a band of Love-lies-bleeding drooping over an edging of Centaurea, was very striking. From the broad flight of steps leading from the terrace to the grounds beyond a fine view is had of the beautifully kept lawns, choice shrubbery borders, large beds of Roses, Dahlias, and other bedding plants in great variety. Beyond can be seen the boundary trees of a Yew-planted maze, and in front the lake with its surrounding shady walks made bright and interesting in season by clumps of Rhododendrons, Azaleas, and other flowering shrubs.

The rebuilding and extension of the mansion to its present noble proportion, as seen in the engraving, fig. 73, was commenced in 1884, and finished in 1887, and during the same period the grounds were completely remodelled. In planting the very choicest shrubs and trees have been selected, and are now growing into effective groups. Mrs. Montifore is not only a liberal patron of horticulture, but takes a deep interest in the welfare of her large staff of servants, by whom she is much respected. Much credit is due to Mr. Glen in bringing the extensive alterations to a successful termination, and for the beautiful condition in which everything is kept.—R. I.

A BOOK ABOUT FERNS.*

THROUGH the deep dells of the woodlands cold winds are sweeping. To the Fern lover it is not a time of pleasure, for many of his favourites are in the midst of their winter sleep and others stand forlorn, looking as much out of place as a slender yacht wrestling with a fierce winter sea. The Fern paradise has lost its beauty for the nonce. But the kingdom of the flowerless is wide, and to the truly catholic there is abundant consolation for outdoor dulness in the graceful denizens of greenhouses and stoves; there need, therefore, be no apology for fulfilling a too long postponed task in reviewing Mr. G. Schneider's great work on Ferns at this the first opportunity of devoting an hour's leisure to its pleasant and instructive pages. It is not Fern time it is true, but in one sense so much the better, for the quiet season of labour affords opportunities of making up the arrears of reading which have been accumulating during past months.

When rumour first spoke of an important new work on Ferns, the name of the author had not transpired, but no error was made in connecting with it the name of the Anglo-French specialist, who has for so many years filled a responsible trade position with credit and even distinction. Mr. Schneider was driven to take refuge in England after the terrible Franco-German struggle that brought his family and his country to the verge of ruin twenty years ago, a struggle in which he bore a manly and honourable part. He arrived ignorant of our tongue, friendless and destitute—fortune seemed, indeed, to have cast him aside; but he had the courage, the talent, the energy of his race, and as France has risen triumphant over her difficulties, earning the respect of all who are not blinded by foolish patriotic prejudices, so he, her son, has acquired an honoured position and troops of friends in the land that gave him shelter. To gain sufficient familiarity with a strange language as to be able to prepare such a work as that now under notice speaks eloquently of the author's ability and assiduity, and in considering what he has done, it is but justice to recall the circumstances which led by such devious and apparently ruinous paths to a prominent position among British Fern growers, and the authorship of the most complete practical work upon them in our language.

The *Book of Choice Ferns* aims at completeness. It deals with outdoor and indoor kinds and varieties, both culturally and descriptively; moreover, it attempts to solve the knotty problem of combining the technical with the popular. There is not the slightest doubt that Fern nomenclature and description as at present recognised and conducted militate in no small degree against the popularity of the plants. No better proof of this could be desired than was provided at the Fern Conference in connection with the magnificent exhibits of British species and varieties from the collections of Messrs. Lowe and Drury. The beauty of many of the Ferns attracted special attention, but after a study of the—to them—interminable and incomprehensible names and descriptions, the uninitiated fled dismayed and mystified. There are powerful elements of popularity about Ferns, and it is to be regretted that technicalities should be allowed to stand in the way of those elements bringing about the desired results. From the specialist's point of view he is perfectly right. "Fronde" may satisfy those who are just cognisant of the fact that such a term is used in connection with Ferns; but what does it convey to an experienced grower? To him pinna and pinnule, perhaps pinnulet as well, are an absolute necessity. It is a vexed question as to which course to pursue. To use general terms means vagueness to the specialist; to employ technicalities is to puzzle and probably alarm the outsider, whom it is the desire to tempt into the fold. There is an honoured place for any genius who may arise capable of bridging over the gulf between the two in this and other matters in a manner satisfactory to both.

Mr. Schneider clearly recognises the necessity for, and the delicacy of, the task. His plan of smoothing the path of the beginner by adding the English meaning of Latin specific names no one will object to except those who are encouraged to rise superior to the necessity for it

by the possession of some more or less superficial knowledge. But it would not be surprising if the author's next compromise (albeit following a respected precedent) were cavilled at by some. He drops the term "pinnule," and substitutes for it the word "leaflet," as appealing "most directly to the mind of the reader little versed in botanical terms." Our sympathy for the latter class is too warm for us to turn a deaf ear to Mr. Schneider's reasoning. There will be many, however, whose sense of propriety will be too severely outraged to permit of their looking upon the step in a work of so high a character without uneasiness.

Mr. Schneider divides the cultivated Ferns on which he treats into ten sections—namely:—(1) Tree Ferns; (2) Gigantic Non-arborescent Ferns; (3) Small-growing Ferns; (4) Ferns with coloured or tinted fronds; (5) Variegated and Crested Ferns; (6) Gold and Silver Ferns; (7) Climbing, Trailing, and Drooping Ferns; (8) Filmy or Transparent Ferns; (9) Viviparous or Bulbil-bearing Ferns; and (10) Curious Ferns. The course of chapters devoted to general information on these sections forms a highly interesting and valuable opening to the book. The particulars of their habitats and management provide a fund of readable and instructive information; moreover, each chapter is closed by a select list of species and varieties. A few quotations from the chapter on variegated and crested Ferns will clearly show the interesting nature of the contents of all. In relation to the crested Ferns, the author, after dealing with the variegated ones, says:—"It has been clearly demonstrated that variegation is a form of variation possessed almost exclusively by Ferns of exotic origin. Cristation, on the contrary, is a form of variation to which European Ferns appear much more predisposed than exotic kinds, for there is scarcely a British species which has not produced crested forms, from the dwarf Asplenium Trichomanes to the gigantic growing Pteris aquilina, or common Bracken.

"In exotic, as in native species of Ferns, cristation consists in the subdivision—in some instance many times repeated—of the extremities of the fronds, by which process a sort of tassel is naturally formed. At other times the cristation is only shown by the bifurcation of the tips of the fronds; but it is interesting to note that, whatever form this character assumes, it generally extends to the pinnæ, which are usually affected in the same manner, though in a lesser degree, as the extremity of the frond itself. Another point which is worth noticing is that the stalk of the frond is seldom, if ever, affected by simple cristation. The abnormal character of the stalks, which occasionally become fasciated or flattened and branched out, is only shown when cristation, by infinite division of all parts, is developed to such an extent as to produce instead of a flat normal frond, either a ball-like mass of green vegetation or an intricate and symmetrically divided sort of latticework.

"Crestation—'monstrosity' as it has sometimes been called—is, when shared by exotic kinds, in the majority of cases constant, as plants partaking of it reproduce themselves freely from spores with very little variation. Such, however, is not the case with British Ferns, as many of them have a tendency to revert to the common or typical form when some peculiarities in their treatment do not agree with them. It is also well known that not only do some of these crested forms revert to the type, but the offspring of these are in many cases extremely variable. Such inconstancy plays an important part in the production of new varieties, as it is now an accepted theory that when the common form has once varied the produce of this variation have a greater tendency to vary again. In the case of the propagation of a specially fine crested form being required, this can only be effected with security by the division of the original plant.

"The variation by way of seedlings in connection with crested Ferns is of such importance that we trust it will not be considered out of place here if we quote Mr. Drury's experience on its reproduction. Speaking on this most interesting subject, Mr. Drury, in a most elaborate article on variation in his excellent work on 'Choice British Ferns,' says "We have ourselves raised a very robust and heavily crested form of Hard Fern (*Lomaria spicant*) from a wild find of similar character, but of smaller growth. Strange to say, the sowing from which this splendid plant originated was so nearly a failure that only the one plant resulted, which, as stated, surpasses the parent; yet when spores of this more marked variety were sown fully 90 per cent. were absolutely common Hard Ferns, two only closely resembled the parent, one far surpassed it, several are of a different type of creasing, one is extremely dwarf, with fronds absolutely fan-shaped, and between these and the common ones there is every grade of creasing, from merely squarish tips to ball-like tufts."

"The foregoing statement, emanating as it does from such a high authority on the subject, and being the result of a series of careful experiments, conducted with a view to ascertaining the constancy of seedlings will, we venture to say, prove conclusive as to the amount of reliance to be placed on the reproduction of crested variations by their own spores. But these remarks apply exclusively to British Ferns. The reproduction of crested exotic kinds is principally effected by seedlings, and generally speaking with most satisfactory results."

Want of space forbids our quoting Mr. Schneider's remarks on the crested exotics which followed those given in the foregoing passages. He passes from them to practical matter pure and simple. The first chapter is devoted to the subject of drying Fern fronds, on which some useful information is given, and the second to fertilisation and propagation. Technical though the latter is it is of the deepest interest, and it is probable that not only botanical students, but general readers as well, will find them worthy of careful consideration. Fern growers in general will not fail to carefully study the long

*The book of choice Ferns: by George Schneider. London: L. Upcott Gill, 170, Strand, W.C.

and exhaustive chapters on culture, while those which follow on "Fancy Ways of Growing Ferns," and "Fern Foes, British and Exotic," are little inferior in interest or value. The next chapter opens the descriptive portion of the book. *Acrostichum* is the first genus taken, and it will give a general idea of the course pursued throughout to indicate the method of considering this genus. A brief general description is first given, then the various groups enumerated in the genus are indicated; culture forms the third point, and finally the principal species and varieties are dealt with. One quotation will serve to show how all are treated. "*A. (Polybotrya) acuminatum*, Pol-yb-ot'-i-y'-a ac-u'-min-a'-tum (taper-pointed) *Hooker*. On account of the drooping character of its light green fronds, of a firm texture, which are abundantly produced from a thick climbing rhizome (prostrate stem) this Brazilian stove species may be considered one of the most decorative kinds comprised in the genus. The barren fronds, borne on firm, erect stipes (stalks) 4 to 6 inches long and scaly throughout, are from 1 foot to 2 feet long and fully 1 foot broad, deltoid (in form of the Greek delta Δ) and simply pinnate (divided to the midrib), with their upper pinnae (leaflets) slightly lobed, truncate (terminating abruptly) on the lower side at the base, 6 to 8 inches long and 4 to 6 inches broad, usually furnished with small pinnules (leaflets) on each side. The fertile fronds are 1 foot long, deltoid, and thrice pinnate. *Hooker, Species Filicum*, v., page 245. *Nicholson, Dictionary of Gardening*, i., page 19. Although its fertile fronds are said to be sub-quadrupinnatifid (four times nearly divided to the midrib) at the base, the Peruvian *A. (Polybotrya) nutans*, *Kunze*, appears to be closely related to this species."

It will be seen that Mr. Schneider is not afraid to employ abundance of explanatory English terms in order to make the meaning clear, and the plan adopted is a distinctly educational one. The first volume, which consists of 660 pages in bold type, and is enriched with many good plates and engravings, takes the work up to and inclusive of the genus *Asplenium*. If completed, as there is no reason to doubt that it will be, in the same thorough, comprehensive and careful manner, it will be a standard work of reference, invaluable alike to advanced growers and beginners. Mr. Schneider is to be congratulated on performing a long and difficult task with signal success.

NATIONAL CHRYSANTHEMUM SOCIETY.

THE General Committee of this Society held a meeting at Anderton's Hotel last Monday evening, Mr. R. BALLANTINE occupying the chair. Several business preliminaries, in the way of minutes, correspondence, &c., having been disposed of, the Secretary announced that Mr. A. Taylor had made an interesting report concerning the cut blooms staged on the occasion of the November Show. Altogether there were 2163 cut flowers shown, of which 1134 were Japanese in 142 varieties, 642 incurred in 75 varieties, and the remaining 387 consisted of reflexed, Anemone, Japanese Anemones, and Pompons. The most popular varieties being a matter of some interest, it may be mentioned that in the Japanese section *Avalanche* was shown 84 times, *Vivian Morel* 68, *Sunflower* 62, *E. Molyneux* 47, *W. H. Lincoln* 45, and *Etoile de Lyon* 40. The leading incurred were *Princess of Wales* 47, *Empress of India* 40, *Lord Alcester* 39, *Jeanne d'Arc* 31, *Queen of England* 31, and *Lord Wolseley* 28.

THE BEAUTY OF EXMOUTH CASE.—AS WE WERE.—The report of the Sub-Committee appointed to inquire into charges made some time since against a member of the Floral Committee was then received, and considerable discussion arose upon it. The resolution passed by the Sub-Committee, and published in the *Journal of Horticulture* on 3rd November, was referred to, since which it was stated that the person implicated, whose name had been confided to the Sub-Committee, had made a sworn statement denying many of the main facts in the charge made by Mr. Godfrey, and after taking legal advice the Sub-Committee considered it was not incumbent on them to publicly make known the person's name, as they might incur an action for libel, and that it was for the *Journal of Horticulture*, where the charge appeared, to do so. Their decision had been communicated to the Editor, and he had refused to publish it.

MR. RUNDELL did not regard the report as satisfactory, the name of the member ought to be mentioned.

MR. ADDISON went into the matter at great length, commenting upon the conduct of the Sub-Committee, and saying he should oppose the adoption of their report. He thought such charges as this detrimental to the Society, and considering the length of time that had elapsed, that the matter should have been satisfactorily dealt with. If they had secured a sworn statement from one party, had an opportunity been given to the other to corroborate or dispute any fact called into question? Again, had inquiries been made as to whether the member was the kind of man to do such a thing? There was another charge contained in a letter against a member, and Mr. Addison was proceeding to remark upon this, but was ruled out of order.

MR. JUKES said he was not less careful of the good name of the Society than the preceding speaker. The way in which the charge had been made rendered it very difficult for a Committee to meet. It was easy to say the Society could deal with the member, but he gives an answer upon a sworn statement that the charges are untrue. If they attached his name to the charge they laid themselves open to an action, and as the charge was made by the *Journal* the least the Editor could do was to take the responsibility on his own shoulders. The Committee had asked for the name to be published; up to the present it had not been, and in the face of the sworn statement they would not incur the risk of an action by attaching the member's name publicly to the charge. If that were published they could deal with the question more fully; until then they could do nothing.

MR. FOWLER spoke on the importance of such definite charges being cleared up. He thought if the member waived any legal rights and came before the Committee, and Mr. Godfrey were asked to come too, the Committee could deal with the case. He was afraid outsiders would consider the question shelved, especially as the Committee's letter to the *Journal* was not made public.

In the end the report was adopted.

A MEMBER CONDEMNED.—Another complaint against a member was then brought forward, and a resolution passed condemning the member against whom it was made.

SHOW BOARDS AS HITHERTO.—A discussion of some length ensued upon the question of enlarged show boards, the Schedule Sub-Committee recommending the regulation to remain as hitherto. Against the proposal was urged the expense, also the probability of many exhibitors and affiliated societies withdrawing if made compulsory. Mr. Jukes, Mr. Fowler, Mr. Gibson, and Mr. Rowbotham were the principal speakers on the subject. The Foreign Secretary was strongly of opinion that cut blooms were intended to be shown as individual specimens of good culture and not as collections. The present boards were not of sufficient dimensions to enable the blooms to be examined properly, and he moved as an amendment, "That the resolution passed at the Conference be put into force at all the shows of the N.C.S. in the open classes for Japanese cut blooms." The amendment, however, was lost, and the view held at the Conference has therefore had no practical effect.

Two provincial and three colonial societies were affiliated. The dates fixed for the 1893 Shows are as follows:—11th, 12th, and 13th October; 7th, 8th, and 9th November; 5th, 6th, and 7th December. It is not intended to hold a September one, but a sum of money will be set apart to provide prizes at a show held in that month by the Aquarium Company.—(Communicated).

[After Mr. Fowler's suggestion it may be expected that the nameless member will hasten to "waive his legal rights" and welcome an opportunity for a full examination of himself and Mr. Godfrey, with such witnesses as either can produce for enabling the examining committee to arrive at the true facts of the case. Is Mr. Godfrey willing to act in accordance with Mr. Fowler's sensible and practical proposition?]

NATIONAL CHRYSANTHEMUM SOCIETY.

I CAN only express my regret if the phraseology of my last letter did not please Mr. Dean; but passing over that, and fully allowing every statement which he makes, the undeniable fact still remains—that the Society, though called "National," is entirely governed and managed by the metropolitan section, the provincial growers being only directly represented by one member out of the total of fifty-seven forming the two committees. That this is a matter for regret will, I think, be generally admitted, and I think also that a far-sighted executive should endeavour to remedy the evil, even if caused by the apathy of those who ought to be most interested, as the stability of any erection depends to a certain extent upon the width of the base bearing proper proportion to its height, and neglect of the principles of construction is usually followed sooner or later by ruin.—CHAS. E. PEARSON.

IN answer to Mr. Pearson's comments I notice that Mr. Dean (page 480) takes exception to the terms used by Mr. Pearson, as "London clique" and "metropolitan exclusiveness," and he also invites Mr. P. to inquire a little more closely into the methods of the N.C.S. I have taken the hint meant for Mr. Pearson. Can Mr. Dean inform us how it is that so many really good Chrysanthemum growers who do not reside in London, are not on the Committee, or even in touch with the N.C.S., although their hearts are in the cause of the Chrysanthemum? Mr. Dean invites an investigation of the doings of the N.C.S. I, with many others, will be glad to learn what is likely to be the result of the investigation, by the Sub-Committee, into the "Beauty of Exmouth" case? The Society cannot intend to drop the matter as if it was a "hot coal." The Sub-Committee, according to Mr. Godfrey's statement, has the name of the person charged with the irregularity; then what, may I ask, would be gained by making such letter public? Is it right to treat such a charge with indifference? Then, as to the letter published by Mr. Wells, can it be true that a member of the Floral Committee is allowed with impunity to utilise his power as a Committeeman to collect his debt? Shall this be tolerated by a "National Society?" and are these the methods which Mr. Dean is so proud of? How comes it that several of the judges who adjudicate on the principal claims are Committeemen, and also members of the Floral Committee? Is this a "National" method? We in the country prefer to have judges from a distance, and outside our provincial society. Pray do not think I

insinuate anything against the judges of the N.C.S. exhibits. It is not the men, but the principle, that does not seem to rest on a national basis, thereby comes the suggestion of "cliqueism." When Mr. Dean has answered these questions, with your permission I will ask him more.—HENRY HAVELOCK.

BOLTON CHRYSANTHEMUM SOCIETY.

WE are informed that the Committee of this Society have arranged for the next exhibition to be held in the Town Hall on November 17th and 18th of next year, and have appointed judges for the same.

CHRYSANTHEMUMS AT HULL—JOHN LAMBERT AGAIN.

YOUR report of the Hull Chrysanthemum Show states that Golden Queen of England was awarded the prize for the premier incurved bloom in the show. In justice to the Committee of N.C.S. (who after a second year's trial gave the sport John Lambert a first class certificate) I desire you to state the real facts of the case. At Hull Golden Queen of England, mentioned as the premier bloom in the show, was staged and labelled by the exhibitor as John Lambert. Someone crossed out the original name and substituted that of Golden Queen of England, a proceeding I feel sure will meet with the condemnation of exhibitors generally, and is altogether without precedent. Perhaps Mr. Molyneux as one of the judges present will kindly give a correct version of the matter.—JOHN LAMBERT, *Powis Castle Gardens, N. Wales.*

THE N.C.S. AND THE WESTMINSTER AQUARIUM.

I HOPE it may be possible, just now that the National Chrysanthemum Society is being referred to in your columns, to suggest that it is worth while striving to elicit some expression of opinion as to the retention of the Society's Shows at the Royal Aquarium. Let it be said at the outset that the position of the Society is fully recognised in relation to the Aquarium Company, also that the Aquarium is one of the most central of places in London. The latter is, perhaps, its chief recommendation. The entertainment monopolises always the best portions of the Show days, and by far the best portion of the floor of the hall, so that the floral portion of the Exhibition is cut asunder by a seating space and a large crowd, through which it is very difficult for those anxious to see the flowers to pass. The consequence is that whilst the Show loses immensely in its effect, very much of the most interesting material is relegated to the gallery, to which only 10 per cent. of those visiting the Exhibition find their way. But these are not the worst feature. The exigencies of the association with the Royal Aquarium Company seem to render a series of three-day Shows necessary. How poor in value are plants, flowers, or fruits, after such long exposure in such a vitiated gaseous atmosphere, and in such a smother of dust as is created. But the worst element of discomfort to many is composed of what may be described as crush, crash, and noise. Real Chrysanthemum lovers do not appreciate music and shouting that drown their voices as they vainly try to discuss the merits of the blooms; then there is the notoriously bad light that positively forbids the full beauty of the flowers being appreciated. I have spoken to scores of members on this subject, some of them prominent ones, yet I have never met with one but did not admit all that is complained of, and fail to find good excuse.

No doubt the directors do all they can to accommodate the Society, but all the same every year shows that the floor area is more and more encroached upon, and the executive of the Society have to put up with it. We are told that were the Shows apart from the entertainment, the public would not patronise them. That has to be proved, and it might be found that if some who now visited the Aquarium would not go to a quiet hall, hundreds of people who detest a noise would go to see the flowers. The records of the Cattle Show at the Agricultural Hall show that the public will patronise a pure Show when they know of it.—ALPHA.

ROYAL HORTICULTURAL SOCIETY.

DECEMBER 13TH.

SCIENTIFIC COMMITTEE. — Present: Dr. M. T. Masters (in the chair); Prof. Oliver, Prof. Church, Dr. Müller, Dr. Bonavia, and Rev. G. Henslow, Hon. Sec.

Garden Labels.—With reference to the value of leaden labels, Dr. Masters observed that some of the same date, about 1774, as of those described at the last meeting, were still on garden walls at Gunnersbury. Dr. Bonavia observed that in India he had found porcelain or china labels with the name burnt in to be the most serviceable.

Abies Smithiana.—Prof. Church observed that a fine tree existed at Shelsley Court, which in 1849 was about 120 or more feet in height. According to Paxton, this species was introduced from Kamaon in 1818, so that it was probably one of the earliest examples.

Malformed Orchid.—Mr. O'Brien sent a flower of *Cypripedium Chamberlainianum* having one of the petals standing above the lip in lieu of a sepal, a not uncommon occurrence.

Arbutus procera.—Flowering sprays of this species were sent by Mr. G. Lee from trees, of which there were three stretching to a length of about 22 feet each. At 1 foot from the ground the trunk of one was 3 feet 6 inches in circumference. The trees were planted about forty years ago. They flower profusely, but never bear fruit. He observes that this species is not cultivated so often as it deserves to be.

Grindelia inuloides.—A flowering stem of this plant was forwarded by Rev. C. W. Dod. It is figured in the "Botanical Magazine" t. 3737.

Peas Attacked by Mites.—A specimen of earth containing mites, which have proved injurious to Peas, was received from Mr. McDonald, of Jura Forest, Greenock. They were forwarded to Mr. Michael for further examination.

Dendrobium Findleyanum, pseudo-bulb.—Sir Trevor Lawrence sent a bifurcating branch of this Orchid. He observes that "Dendrobium bulbs often make side shoots from the 'eyes' at the apex of each segment, but this example seems to be a true bifurcation, due it would appear from the bend in the branch to some arrest of growth by a wire or another bulb." A microscopical examination appeared to confirm the above view, for the stem was single at the base, but a slight constriction began on one side, then a second appeared on the opposite side, higher up, until they deepened and met, thereby dividing the single stem into two.

NATIONAL ROSE SOCIETY—VOTING BY PROXY.

INDIVIDUALLY, I regretted that both Mr. Pemberton's proposal as to altering the date of the Metropolitan Show of the National Rose Society (reported by you on page 536) and Mr. Foster-Melliar's proposition to allow members to vote by proxy, were negatived last Tuesday. I hope, however, they may be proposed again next year. There may be rosarians whose counsels might be very valuable to the interests of the National Rose Society, while it seems to me very unreasonable to put them to the trouble and expense of coming from Ireland, Scotland, or Wales to vote when it could be done for a penny by naming a proxy in a letter.—F. H. GALL, *Hitchin.*

CÉLINE FORESTIER.

MR. DUNKIN, page 349, rightly observes that Céline Forestier is a valuable hardy Rose. We have several very large trees which have been planted over twenty years against the terrace walls with a south-east aspect, fully exposed, and these have never had any protection in winter other than a mulching of short manure about the roots. The trees have annually produced a successional crop of useful blooms, of which we have a good supply at the present time, as you will see by enclosed buds.—JOHN CHINNERY.

[The flowers sent were remarkably fresh and fragrant for the time of year.]

MADAME FALCOT.

ANOTHER good Rose which I should advise anyone to add to Mr. Dunkin's list if they are forming a collection is Madame Falcot. I had a tree of it planted on a south-east wall in Monmouthshire, which grew well and produced a plentiful supply of well developed buds of a good colour. The foliage of this Rose is very ornamental, assuming in a young state in the autumn a dark colour, which produces when used for buttonholes or for other purposes a pleasing contrast to the bud. Whether for private use or for growing for market this is a most valuable Rose, as it readily sells on account of its pleasing colour.—J. C.

ROSE JUDGING AT N.R.S. EXHIBITIONS.

THE National Rose Society is to be congratulated on its almost perfect system of judging at the various exhibitions held under its auspices, the rule being "that successful exhibitors only shall be permitted to act as adjudicators;" and whilst I should be sorry and very wide of the mark to say that they alone are able to properly make the awards, it is well that the judging can be done by those who are successful growers and exhibitors. That portion of the community who spend the greater part of their leisure amongst Roses (and they are an important portion, embracing clergymen, lawyers, doctors, and intelligent tradesmen of various pursuits), and who are ever and anon occupying the "pride of place" at the N.R.S. Exhibitions, are well qualified for this somewhat arduous though exceedingly pleasant and important duty, as also are they who make Rose growing a study for trade purposes.

Of late years the disappointed Rose exhibitor has almost ceased to exist. So conscientious and careful are the Judges in their work that the exhibitors most cheerfully accept as their due the piece of cardboard which indicates their position, be it first, second, third, or fourth. Many are the stories that could be related of disappointed exhibitors, some of whom have buttonholed the unfortunate Judge, and "had it out" with him then and there; others have rushed into print, and fought out their battle by the aid of a free Press. To-day a better feeling seems to pervade; all, more or less, resemble the gentleman who, upon being told he was "nowhere" to-day, and asked if he considered the judging correct, calmly replied, "I never question the decision of the Judges." The system of selecting adjudicators from the roll of successful growers is an excellent one, and it is to be hoped there may never be a lack of willing spirits to undertake this most important item in the programme of Rose exhibitions.

There are, however, one or two matters that might receive even more attention than has hitherto been bestowed upon them. One is that the judges selected be asked only to take part in judging classes similar to

those they compete in, for may not grave mistakes occur if those who are growing, say, only 300 or 400 plants be required to give their assistance in the most important classes? Those very growers may have the necessary love and enthusiasm, do they also possess the requisite judgment? Which, I venture to say, comes only with long experience. Their knowledge of the vagaries of a certain variety may be restricted to perhaps the cultivation of less than half a dozen plants.

Another matter that demands most careful thought and attention is the consideration of the new varieties that are presented year by year "for the opinion of the Judges." Ought there not to be two or three good Judges set apart for this important work who may immediately commence upon their "labour of love" whilst the sweetness and freshness the exhibitor has laboured so hard to retain still lingers lovingly in each petal? At Chester this important piece of work was left until nearly two o'clock; each unsuccessful variety would have come better through the ordeal had judging commenced at eleven o'clock. The "best phase of their beauty" was passing away every hour from eleven to two; nearly three long hours dragged their weary length along before those properly authorised to make the awards commenced to critically examine them. A recurrence of this kind must surely be avoided.

There is also one other matter worthy of passing notice, namely, the manner in which the premier blooms receive their awards. Would it not be better to empower each set of judges to select a "likely candidate" from the classes they judge, and when the various stands are judged to allow these candidates for premier honours to be staged on a suitable stand, and at least twelve "good men and true" decide which bloom shall blushing carry off the "blue riband?" This most interesting award is apt to lose its charm if the making of it falls to one who allows himself to be hurried, or who happens to have a favourite variety. A Boieldieu has won it, also a Pierre Notting, and rightly so too if each possessed the requisite quality. "Honour to whom honour is due." I regret that more than once have I heard expressions of disappointment uttered by the public when, after long searching, they have at length found the bloom that has won the coveted position and medal. Nor has there always been a consensus of opinion amongst the "doctors" respecting this award. In my opinion no reasonable amount of labour should be withheld to make this important and interesting selection a satisfactory one.—E. R. SHANKS.

[The above notes were in our hands prior to the publication of our report of the N.R.S. annual meeting on page 535 last week.]

HARKSTEAD, SUFFOLK.

It was in the very early part of last year that I first made acquaintance with that almost insular portion of Suffolk county in which Harkstead is situated. I write "almost insular," for it is bounded on three sides by water, and its base is the straight bit of railway joining Ipswich and Manningtree. On the north we have the picturesque tidal river Orwell. On the east the German Ocean. On the south another tidal river, one of the numerous Stours of England. A glance at the map will at once show the exposed situation of this prominent corner of East Anglia, while a drive from Ipswich to Harkstead (seven miles) in the face of a blinding snowstorm, and the thermometer down to 12° Fah. gives the traveller a fairly practical experience of what is not uncommon weather in this part of England in the winter months.

My second visit to Harkstead was at the beginning of July; it was a lovely day, so in order to avoid the dusty roads I took the steamer at Ipswich, disembarking at Pin Mill, the half-way house to Harwich. This river trip is very delightful, and the scenery as you pass between Woolverstone and Orwell Parks is delightful, the woods and walks extending to the margin of the river on each side. Woolverstone Hall, the seat of Charles Hugh Berners, Esq., stands in a well wooded park of upwards of 400 acres, while in Orwell Park on the opposite side of the river is the seat of Capt. E. G. Pretymann. Pin Mill, where I landed, is a very picturesque little fishing village, and in the summer the place is lively with yachts. Some years ago no less than thirty boats were constantly engaged here dredging for Septaria, but only half a dozen are now so employed. Some of the readers of the Journal may be puzzled to know what is meant by the word "Septaria." They are spheroidal masses of argillaceous limestone, according to geologists, while the Zoological septaria are a genus of acephalous molluscs. The Orwell septaria is supposed to produce the finest quality of Roman cement. Pin Mill is about two miles from Harkstead through the village of Chelmondiston, where there is a telegraph office. Taking the path across the well-cultivated fields (for in this part of Suffolk is to be seen really good farming—the farms are large, the farmers men of capital) I soon see the tower of Harkstead Church standing like a sentinel on the high land between the two rivers. In a few minutes I am at the Rectory—but the rector is away. Away! Why, naturally, for this is the first Saturday in July, and, of course, he is at the Crystal Palace winning prizes at the National Rose Society's Show. My first impulse is to rush into the garden, but as I remember that I am to stay here until Monday, I rest awhile after my walk under the hot sun and enjoy five o'clock afternoon beverage.

The Rev. Hugh A. Berners has been before the Rose world as a very successful exhibitor for many years. He, together with the Revs. A. Foster-Melliar and F. Page-Roberts, are the East Anglian amateur champions. But it must not be supposed that Harkstead is famous for its Roses only. For instance, walking through the Hall we enter the conservatories: splendid structures, and full of flowers all the year

round. The Rector will not be without them; the demand is made, the gardener must find the supply, and the gardener's work would appear to be simple, judging by the result, for the flowering plants are constantly being changed, and there is everything beautiful in its proper season. What a mass of bloom was there last spring! Beautifully grown Arums, Spiræas, Tulips, Hyacinths, Azaleas (splendid), Carnations, Narcissi, Freesias (grandly grown), Tea Roses, Lily of the Valley, and pots upon pots of Gladiolus The Bride. These and many other flowers, gracefully interspersed with *A. cuneatum*, *gracillimum*, and *farleyense*, were indeed a joy to behold.

Leaving the conservatories we walk through the Orchid houses. Among the *Odontoglossums*, 100 in number, one noticed as being good *Alexandrae*, triumphans, *Rossi majus*, and *Pescatorei*, while the *Phalænopsis* were well represented by vars. *amabilis*, *grandiflora*, *Schilleriana*, *Stuartiana*, and others. *Dendrobiums* are evidently in favour at Harkstead, some of the varieties flowering beautifully, especially *albo-sanguineum*, *thysiflorum*, *Parishi*, *crassinode*, *Ainsworthi*, *Findleyanum*, and *Dearei*. Among the *Cattleyas* I noticed especially *crispa*, *Lawrenceana*, *Harrisoniana*. *Cypripediums* *Spicerianum*, *vexillarium*, *Stonei*, and *Lawrenceanum*. *Pleione humilis* and *Lagenaria* were also good.

Opening another door we find ourselves in the first vinery, the staging of which in February was crowded with many hundreds of

FIG. 74.—REV. HUGH A. BERNERS.

bedding plants. The Vines in July were carrying grand crops of splendid bunches. Another newer and very large house with every modern improvement is divided into two portions—a vinery and Peach house. These younger Vines gave proof of Mr. Berners' gardener's skill. *Madresfield Court*, *Gros Maroc*, *Alicante*, *White Tokay*, *Black Hamburgh*, and *Foster's Seedling* are grown. In the Peach house *Noblesse* was the best. Perhaps the palm must be given to the *Nectarines*. The previous year no less than fourteen dozen grand fruit had been gathered from a trained tree of *Violette Hâtive*, while *Pine Apple*, *Lord Napier*, *Pitmaston Orange*, and *Elruge* were carrying as much fruit as they should. I was much struck with the clean wood and foliage. In the spring this house was utilised for Tea and H.P. Roses in pots.

But it is time now to go outside and examine the Roses. The soil in the upper garden is not what we call a Rose soil; it is too light, and the slope towards the south is so steep that any heavy rain rushes down into the little stream at the bottom of the garden, carrying with it much of the goodness of the top-dressings. But on the further side of the stream, quite in the valley, a real Rose soil is to be found; but being quite in a hollow, the position is apt to be flooded and affected by the spring frosts. Mr. Berners is a great believer in protection—that is, so far as his Roses are concerned. He puts his Teas to bed in the winter, both standards and dwarfs. The heads of the standard Teas are carefully bound up thickly and firmly with clean dry straw, so thickly that the wet cannot permeate and cause anything like sweating. Whether so much protection is really needed I know not; but he can tell us that the proverb, "the proof of the pudding is in the eating," holds good in this instance, for no exhibitor in England has won more if as many prizes for Teas the past two years in proportion to the number of plants grown. In all there are but 500 Teas. The H.P.'s number about 1800, and many of these are not what I should call exhibition varieties.

Among the H.P.'s, on the strong soil, Duke of Edinburgh, *Eclair*, *Ulrich Brunner*, *Capt. Christy*, *Madame G. Luizet*, *Mrs. J. Laing* made excellent growth, *G. Luizet* being pruned on the "long" system, and that with remarkable success. The standard and half-standard Teas, however, excite most admiration. On a sheltered border outside the Orchid houses there are some magnificent examples of *Madame Lambard*, *M. Niel*, *The Bride*, *Comtesse de Nadaillac*, *Catherine Mermet*, *Ethel Brownlow*, and *Madame V. Houtte*. There is one variety of *Rosa indica odorata*, which grows and flowers magnificently at Harkstead Rectory. I allude to *Innocente Pirola*, and this on standards. Among the newer ones I noticed grand plants of *E. Metz*, *Madame Hoste*, while *Cleopatra*

and Princess of Wales produced large, full, and perfect flowers. Mr. Berners keeps cows—beautifully bred Jerseys I think they are; and the manure from his little farmyard is just suited to the character of the soil. Hard pruning is the rule, the heads well thinned out, and this with the natural result—well-ripened firm wood.

On the S.E. side of the Rectory, which is beautifully situated, are three terraces, leading down to the Italian garden, which should have been a blaze of colour when I last saw it; but it had been under water, or rather under mud and water. We who live in East Anglia are not likely to forget that awful storm on the night previous to the Ipswich Rose Show. The wall of the terraces are clothed with Ampelopsis Veitchi, choice Ivies, and Tea Roses; while the beds on the Italian garden are filled chiefly with Tuberous Begonias and Ivy-leaved Pelargoniums. Beyond these beds are banks of Rhododendrons, Azaleas, and Lilium auratum, revelling in the prepared peaty loam. Some very fine specimens of shrubs and Conifers give a pleasing finish to this interesting garden.

The kitchen garden is highly cultivated, quality being the first consideration. In spite of the light soil the Strawberry beds yield heavy crops of fine fruit, the four varieties relied upon being Noble, Keen's Seedling, Garibaldi, and British Queen. Oh! that the quality of this last could be had together with the constitution and cropping qualities of some other of our Strawberries!

Of late years Mr. Berners has launched out strongly in another direction in order to satisfy his love for flowers; for five consecutive years has he won first honours at Ipswich for Chrysanthemums in groups, besides many first prizes for cut flowers, Japanese and incurved. In November, 1890, he boldly attacked the Royal Aquarium stronghold, and came back to Harkstead winner of the first prize for thirty-six. In all about 200 plants are grown, a few among the many special favourites being Vivian Morel, W. H. Lincoln, Lilian Bird, Edwin Molyneux, Etoile de Lyon, Gloire du Rocher, and Beauty of Castlewood.

I forgot to mention the Gloxinias. Veitch's erect strain are the only ones grown, and they are cultivated in very considerable numbers. The gardener is very proud of them, and he has a right to be. Of Cucumbers Veitch's Perfection is the favourite; Tomatoes, Ham Green and Perfection; Melons, Countess, Read's Scarlet Flesh, and Denham Beauty.

Finally, Who is the gardener, and what is his staff? To have won 500 prizes in twelve years is an achievement! Most of the exhibitors and their gardeners in the larger amateurs' classes at the home, southern, and East Anglian Rose Shows know and respect genial, kind-hearted, and unselfish George Jordan. He is a thorough gardener in all its branches, equally expert in the use of the spade as in the propagation of the tenderest of stove plants. Not afraid of work, and withal, loving his craft, systematic, quick, but sure, he, and a most excellent under gardener, with a small lad thrown in, do the whole work. It is clearly evidence of the saying that perhaps more and better work is done when the staff is rather under than over-handed. Robert Rush, Jordan's right hand, has the cows and farmyard to look after as well.

To my mind Harkstead Rectory gardens are a great credit to all concerned, from the master who loves his flowers and is proud of his gardeners, to the small boy who can gather Strawberries all the afternoon without eating any himself; for the moment he stops whistling Ta-ra-boom-de-ay, or some other equally classical melody, Jordan looks round to see what's the matter.—JOHN HOPPER.

[We have pleasure in inserting a small portrait of the "master" and accomplished amateur gardener, the Rector of Harkstead.]

FRUIT—A PLETHORA OF VARIETIES.

HAVING seen Mr. Watkins' collection of 270 dishes of distinct varieties of Apples at the Hereford Show, I can corroborate all that he says on page 538 of the *Journal of Horticulture* relative to the collection being educational as well as effective. I am sorry some award was not made in recognition of its value. At a London fruit show a medal would have been awarded to such a collection. Mr. Watkins is to be thanked for helping to make the first Herefordshire Fruit Show a success, and no doubt when the Society is well supported by subscriptions collections like Mr. Watkins' will receive their reward.

Considering the different requirements of people I do not think that nurserymen are to blame in offering to the public a long list of varieties of fruit. It is well known that some sorts will do well in one place, but not in another. I like to have my Keswicks, Cellinis, Tom Putts, Blenheims, Mère de Ménages, Dumelow's Seedlings, and King of the Pippins in plenty; but at the same time I like to have my experimental quarters, where new sorts can be grown and their qualities as to cropping and flavour tested on different soils, not for my own satisfaction alone, but for the benefit of the general public. Profitable fruit culture for market, as your correspondent remarks, is best limited to a few select free cropping and well coloured varieties, be they local or otherwise, and known to suit the soil in different districts; but let us not discourage the production of new varieties of Apples any more than of any other fruits while retaining our old well tried favourites.—JOHN CHINNERY.

PERHAPS there are too many sorts, but no one is compelled to grow them all. And if from so many it is difficult to make a best selection, at least it might be found, were the numbers limited, that some selections would not suit various soils or situations, and the larger the area of selection the greater probability that all soils and situations can be suited. I very much doubt whether any half dozen of nurserymen who

grow their tens of thousands of trees, in various parts of the country, would agree on any best selection, and it would no doubt be the same so far as private growers are concerned. Apples vary so much in different places that a wide range of selection is essential. It is those who, having tried new or hitherto unknown sorts, find them of poor quality and value, yet continue to grow them, who are to blame. The nurseryman would gladly cut down his ponderous lists if he could, but so long as certain sorts are asked for they must be furnished. If the trader has to decline an order because he has not all or only a few of the sorts wanted, the customer goes elsewhere, and probably never returns. The trade must not be blamed for what they cannot help. They are the purveyors to the public, and not censors. The very best that can be done in each locality or county is to advise what sorts are found to thrive best, and publish lists of such for the information of planters. Any who still persist in growing worthless sorts then have only themselves to blame. It is very often needful to point out that for market sale some sorts are more suitable, whilst for ordinary domestic use and keeping a long season others are better. It will take twenty years yet to purge our gardens and orchards of worthless varieties, and even then some now esteemed sorts may be then thought but second-rate. We are increasing our stock of Apples almost rapidly. New ones come into commerce more readily than old ones are expurged. The more Apple knowledge is spread the easier will it be for growers to determine which only are the best varieties for their purpose.—A. D.

FRUIT FORCING.

Peaches and Nectarines.—*Earliest House.*—The trees must not be syringed after the blossoms show colour, but a moderate moist atmosphere should be maintained by damping the paths and borders in the morning and in the early part of the afternoons of bright days. Maintain the temperature at 50° to 55° by day, with an advance from sun heat to 60° to 65°, but not without complete ventilation, 50° being sufficiently high for the night. If the weather is cold and sharp, the temperature may fall to 45°, or during severe frosts to 40° at night, which is more advantageous than a higher and drier heat. The house should be freely ventilated when the weather is favourable, especially when the blossoms show the anthers clear of the petals; avoiding cold draughts, however, but admit a little air constantly by the top lights. Houses that have innumerable "chinks" of air may remain closed in stormy weather. The temperature, however, must be raised early in the morning to 50°, and be kept between that and 55° through the day; but 55° must not be exceeded by artificial means, nor an advance allowed above it without a free circulation of air, and it is not a good plan to "bottle" sun heat at this stage. A close moist atmosphere favours growth more than the setting of the fruit. Under favourable climatic conditions the pollen is dispersed in golden showers (clearly visible in the sun) when the day is bright and ventilation has been attended to early, and the "set" is generally a favourable one, even without artificial fertilisation. The trees or trellises, however, may be sharply shaken every day from the first pollen on a tree becomes ripe until the latest flowers thereon have cast their petals. A plume of Pampas Grass drawn over the blossoms lightly scatters the pollen, or a rabbit's tail mounted on a small stick may be similarly used. A camel's-hair brush passed over pollen-laden anthers and applied to the stigma of each flower is, however, the most certain method of artificial fertilisation, operating after the house has been ventilated some little time.

Second Early House.—The trees must be started without delay to have ripe fruit in May or early June according to the variety. Alexander and Early Louise Peaches started now will ripen the fruit in May, but Stirling Castle and Royal George started at the same time will be a month to six weeks later in ripening their fruit. Fire heat should only be employed to keep out frost at night and to insure 50° by day, above which ventilate freely, and close the house at that temperature, except that a little air should be admitted constantly by the top ventilators in close fitting houses. Bring the trees on slowly, not hurrying them in swelling the buds; and if these are too abundant rub off those on the under side or at the back of the growths. Sprinkle the trees in the morning and early in the afternoon of fine days only, damping sufficing when the weather is dull. Apply water if necessary to bring the soil into a thoroughly moist condition. Outside borders may be covered with about 3 inches thickness of leaves and litter, but avoid thick and rich coverings.

Succession Houses.—These cannot be kept too cool after the leaves are all down and the trees have been pruned and dressed. If the roof lights are fixed the borders must be carefully examined, and water supplied to keep the soil thoroughly moist. Dryness at the roots during the rest period is a fertile source of the buds falling, and thorough waterings will not do any harm provided the drainage is effective. The lights, however, should be removed from the roof whilst the trees are at rest. The frosts are never so severe as to injure the wood of trees in good health and profitable use, and the borders become thoroughly moistened by the winter rains and snow, so that they seldom require

water until the fruit is taking the first swelling and entering on the stoning process. Trees under fixed roofs seldom have the soil thoroughly moistened, therefore the buds are imperfectly formed, and are cast when they should be developing into blossom.

Unheated Houses.—We remove the roof lights from these directly the leaves are all down, and they remain off until the beginning of March, earlier or later according to the season. The buds are then commencing to swell, some having burst their scales and showing the downy integuments that protect the blossoms. Up to that stage they are simply frost proof, for it is not the buds that suffer from severe frost, but the unripe wood, and that is worse than useless, as it falls a prey to gum disease. We also defer the pruning of these trees until the spring, which is a light affair, as they are grown on the long-pruning system, and all the useless wood is cut out directly the fruit is gathered, so that the wounds heal at once, and the winter pruning is rendered almost nil.

Pines.—We again direct attention to the necessity of making preparations at once for producing ripe fruit during May and June. Black Jamaica—an excellent fruit, especially in winter—Charlotte Rothschild, and Smooth-leaved Cayenne plants, which, however promising now, failed to show fruit during October and November, will not throw up in time to ripen at the time named. Attention must, therefore, be directed to such as attain perfection in less time, as the Queens, Enville, and Providence varieties. Select at once those plants which have an enlarged base with a tendency to open in the centre, evidence that the fruit will shortly be visible, and place them in a light house or pit, affording brisk bottom heat, say 85° to 90°, a top heat of 60° to 70° at night, 70° to 75° by day artificially, and 10° to 15° more from sun heat. When the external conditions are favourable, a moderate amount of ventilation must be given, and the atmosphere should be genial, syringing the plants once or twice a week, and then very lightly, damping all available surfaces in the house, except the hot-water pipes, on fine afternoons. Water will be required at the roots about every ten days, but do not supply it until the soil becomes dry, and then in a tepid state, with a little guano (1 oz. per gallon) or some other fertiliser in it, and always copiously, dribbles doing more harm than good.

Cucumbers.—The weather has been tantalising, and necessitated sharp firing sometimes, but there have been bright and mild intervals, so that the growth has not suffered like it does when the days are cold and the sun obscured for lengthened periods. Cucumbers like light, heat, and moisture; the glass should be kept clean both inside and outside. Add a little soil over the roots as they protrude through the sides of the ridges or hillocks, using warmed sweet soil, and moderately moist. A few sweetened horse droppings sprinkled on the surface of the bed occasionally will attract the roots and supply them with food. Supply water only when the soil is getting dry, then afford a soaking. Plants in limited borders, pots, and boxes should have liquid manure, always tepid, and not too strong nor too often. Damping available surfaces, or the paths and sides of the bed and house, will be sufficient to maintain a genial atmosphere if it be attended to in the morning and in the afternoon of fine days. Remove surplus fruits as they appear, also tendrils and male blossoms, unless they are required for impregnating the fruit-bearing flowers. Stopping and thinning will not be much needed, but it must not be neglected, as crowding is the precursor of evil consequences. Tie in the growths as necessary. Do not overcrop the plants, and be careful not to allow the fruit to remain longer on the plants than to attain a useable size; they keep fresh several days after being cut if the heels are inserted in a saucer of water in a cool place, but safe from frost. Red spider is sometimes troublesome, especially in structures that are badly heated, necessitating, as it does, sharp firing. Sponging the infested leaves with a solution of softsoap, 2 ozs. to a gallon of water, is a sure, and, all things considered, the safest remedy; but it requires to be taken in time, for when the pest has obtained a footing it is difficult to prevent its rapid spread. White fly succumbs to repeated fumigation, only damp the floor, but not the plants, prior to commencing. Mildew may be kept under by dusting the affected parts with flowers of sulphur, or the hot water pipes may be brushed over with a mixture of sulphur and skim milk, the fumes of the sulphur being fatal to red spider, white fly, and mildew. Green and black aphides may be destroyed by dusting with tobacco powder or fumigation with good tobacco paper or rag on two or more consecutive evenings, but be careful to deliver the smoke cool and not give an overdose, as the foliage is at all times, especially at this time of year, thin and soon injured.

THE KITCHEN GARDEN.

Tomatoes.—Plants put out on ridges of soil on narrow borders too late in the season to attain a productive size before the winter sets in are very liable to collapse suddenly, a disease attacking the stem just above the soil. Apparently there is no certain remedy for this, though keeping the plants somewhat dry at the roots is a fairly reliable preventive. Pot culture is the best for winter Tomatoes, few or no plants being lost when the roots are confined to 10-inch or rather larger pots. Given a light position, a fairly brisk heat, ranging, say, from 55° by night to 60° in the daytime, accompanied, when possible, by a circulation of dry air, the plants will grow strongly and produce bunches of flowers in due course. In order to set these go over the plants every day at about 12 A.M., and smartly tap the footstalks of the bunches with a light stick, this being sufficient to distribute the pollen, some of which is certain to lodge on the pistils. Give water somewhat sparingly till at least three good clusters of fruit are set on each plant, then pinch out the points and treat more liberally at the roots. Pot plants in full bearing may well receive moderately strong liquid manure each time they are watered, a top-dressing of rich compost also being good. Those

plants that are on the roof and now yielding fruit plentifully need not be cut out after their crops are cleared off; this is advisable if badly infested by the white fly known as *Aleyrodes*. Such strong plants, if retained and liberally treated at the roots, would soon form abundance of fresh shoots, which, if laid in thinly, will produce early and valuable crops. Seedlings or rooted cuttings in small pots should be placed in their fruiting quarters early in the new year, otherwise they will very probably be surpassed in productiveness by others which may have been raised from seed sown early in January. A hard sturdy growth is desirable, but this can best be brought about by planting in a firm bed of fresh but not very rich soil, keeping them starving in small pots being anything but a good preparation.

Diseases and Insect Pests.—A free use of fire heat accompanied by a good circulation of dry air effectively checks the spread of diseases of a fungoid nature, and that is the reason why less of them is seen during the late autumn and winter months. If the same conditions were persevered with in the spring disease might simply be defied, maintaining a moist atmosphere such as suits a variety of other growing plants really invites an attack which nothing short of a return to a more rational treatment will obviate. At the same time if the old plants are at all diseased, these and any small ones that have been prepared with the idea of making a good early start, ought all to be thrown away, and a thorough cleansing process given the houses. Starting afresh with new soil and healthy newly raised seedlings the progress made will be rapid and in the end a decided gain will be scored. Especially ought those who grow Tomatoes for the markets to strive to make a clean start, though the temptation to be among the earliest to consign fruit not unfrequently induces them to run risks in the direction of putting out autumn-raised plants. Prices are good in May, and it ought to be possible to have fairly large quantities of fruit ready to send to the market during the early part of that month from January-raised plants.

PLANT HOUSES.

Freesias.—As these start into growth they should be placed on a shelf moderately close to the glass where the temperature does not exceed 50°. If the tubers have been covered with cocoa-nut fibre refuse until they started into growth light must be admitted to them gradually until the stems are green. This is best done by standing them at the base of some house or pit where the temperature is suitable. If required to flower in batches the majority of the plants should be allowed to come forward under cool conditions.

Primula obconica.—This plant does better where the temperature ranges from 45° to 50° at night than in a perfectly cool house where frost only is excluded. In the latter the foliage assumes a sickly yellow appearance; in fact the plants are starved. By the aid of gentle warmth growth continues, and flowers are very freely produced.

Chrysanthemum Cuttings.—As cuttings can be obtained they should be inserted without delay before they become drawn or weakly. All kinds needed for the production of large blooms ought to be inserted singly in thumb pots filled with a light sandy soil. They root so freely that scarcely one will be lost if placed under handlights stood in a cool Peach house or vinery. When propagated under cool conditions there is no fear of the young plants receiving a check during the process of hardening. Those needed for decorative purposes may be inserted thickly together in handlights in which a few inches of light soil has been inserted. Directly these are rooted they should be potted singly, or two or three placed together in each pot. Free-flowering kinds only should be selected for bushes when allowed to grow and flower in a natural manner.

Lilium candidum.—Plants that were potted as advised in previous calendars will be now showing their flower stems. These should be given a temperature of 45° to 50°, where they will grow slowly. These plants must not be hurried in their present stage, or they will be spoiled. Give air daily when the weather is favourable to insure steady growth. Watch for aphides, and destroy them at once by fumigating with tobacco smoke.

Lilium Harrisii.—If not removed from the ashes in which they were plunged when potted these should be taken out at once. Stand them for a time in the greenhouse until their stems are green, and then place them on a shelf close to the glass. We find these plants always start best in a frame with the surface of the pots covered with 2 inches of cocoa-nut fibre refuse. In this position the plants remain until they grow through, and then they can be removed and placed direct upon a shelf. Water as soon as the pots are removed from the plunging material, and be careful not to allow them to become dry afterwards. Select from the earliest batch the most forward plants and place them in the temperature advised for *L. candidum*. Under these conditions the plants will move forward and flower early.

Hyacinths, Tulips, and Narcissi.—These and other bulbous plants plunged under ashes should be removed if ready before the material in which they have been placed becomes thoroughly frozen. Those not ready should have a good layer of litter covered over them, so that they can be examined and removed when sufficient roots have been made. Those that are removed must have light admitted to them gradually, but be careful not to place them close to hot-water pipes that may be used to keep out frost. In such positions they become unduly excited and dried. The later batches of the early Roman Hyacinths will move forward rapidly enough under greenhouse treatment, unless an extra quantity are needed for any special purpose. Early Tulips needed for Christmas may be pushed forward in the forcing house if sufficient heat is maintained; if not place them in the propagating house. If the plants have been properly prepared and are well rooted heat will not harm them.

THE BEE-KEEPER.

APIARIAN NOTES.

SPACE OVER BEES.

THIS during winter is an incentive to disease and spring dwindling. Bees live together and communicate heat to one another on the same principle as some animals do that nestle together. Damp must be almost or entirely absent, a state of matters not to be found in most nineteenth century hives. In properly prepared hives bees winter well at and even under a zero temperature outside. Within doors in a darkened room they will bear confinement, *i.e.*, enclosed within their hives for several months while the temperature is below freezing, but at a temperature of 40° and upwards not longer than for a few days. At a temperature of 45° to 55° bees will remain healthy for months, but they must not be confined, and should have ample space for the contraction or expansion of the cluster. No ray of light whatever must reach them in that state. Outside wintering for this country, so far as my experience goes, cannot be improved upon.

BROOD DRAWING.

This sometimes commences at an early date, and under circumstances least suspected. From the answers I have seen given to questions on this subject by modern teachers, it is evident they lack the knowledge to guide their pupils properly. As a rule after bees commence breeding in the early part of the year they will continue as long as they have a supply of pollen and honey, and even after the former is scarce; but the bees underfed of that essential are small. Sometimes if the weather becomes chilly and unfavourable they will eat large quantities of eggs and brood. But the time bees are most liable to destroy their brood is shortly after a flow of honey, whether that be in large or small quantities. The bee-keeper should therefore study this subject, and so prevent the calamity that apparently few as yet understand. I have put a stop to it by exchanging the queens of two hives. Moreover, I have, after depriving the queen regnant of a brood-drawing hive, introduced a young queen, when the brood-drawing which had stopped begun anew, and was carried on till the end of the season. Bees will at one time of the year suffer death by want rather than destroy the brood, while at others they destroy the brood although the hive has large quantities of surplus honey.

A FERTILE AND PROLIFIC QUEEN.

So far as I have experience, fertility or prolificacy is more a question of the time a queen will continue laying eggs rather than the number she will deposit in a day. I have never known a queen, or queens, to fail in her maternal duties from the moment she commenced laying till the bees showed signs of having her superseded; indeed, even this does not always predict a waning queen. I have repeatedly removed queens that were doomed by the determination of bees to raise queens both at timely and untimely periods. When we can prevent bees raising queens we shall be able to prevent swarming, but not till then. That problem is as yet unsolved. On a future occasion I will give instructions how to proceed with the progeny of two queens in one hive.—A LANARKSHIRE BEE-KEEPER.

BEES AND STONECROPS.

It may be remembered that, some time ago, in speaking of *Sedum spectabile*, reference was made to its stupefying effect on bees. "A Lanarkshire Bee-keeper" at that time suggested that it might be caused by the smell from the *Sedum*, and desired me to observe the effect of other Stonecrops upon the bees. The weather of the past season has again been very unfavourable for the purpose of careful investigation of the subject. I have, however, paid as much attention to it as possible, and the following is the result of my studies. 1, None of the early flowering Stonecrops have been frequented by bees, probably owing to *Clover* being plentiful in the district. 2, The following others have been observed to be constantly frequented—*viz.*, *S. spectabile*, *S. telephium*, *S. cordifolium*, *S. populifolium*, *S. Ewersi*, and a yellow unnamed Stonecrop, resembling a tall, late-flowered *S. reflexum*. 3, By none of these do the bees seem to be stupefied except in the case of *S. spectabile* when grown in quantity together. It is obvious, however, that the question cannot be properly decided without growing the other Stonecrops also; but the result seems to lead to the conclusion that "A. L. B. K." is correct in his belief that the effect on the bees was caused by the odour, and also that even ardent bee-keepers may grow the Stonecrops without fear of loss of their bees unless the *Sedums* are grown extensively and in a mass.—S. ARNOTT.

PUNIC BEES.

"A LANARKSHIRE BEE-KEEPER" inquired whether the yellow colouring of the combs sealed by my half-bred Punic bees was caused by propolis or pollen. I do not think it was caused by propolis, but cannot say whether pollen was the cause. The hive swarmed, leaving sections partly filled. These I took from the old hive and placed on the swarm. The bees partly sealed them, but had not time to finish them before the honey flow ceased. I noticed that these sections, as well as all the honey which was sealed in the body of the stock hive and in the swarm, were sealed a yellow colour. It was not like the ordinary discolouration which arises from the combs in sections being left too long on the hive over the brood nest, but had a transparent appearance.—C. Northumberland.

TRADE CATALOGUES RECEIVED.

James Veitch & Sons, Royal Exotic Nursery, King's Road, Chelsea.—*Seeds, Horticultural Implements, &c.*
E. Webb & Sons, Wordsley.—*Spring Catalogue of Seeds, &c.*
Dickson & Robinson, 12, Old Millgate, Manchester.—*Seed Catalogue.*
B. S. Williams & Son, Victoria and Paradise Nursery, Upper Holloway, London.—*Flower, Vegetable, and Agricultural Seeds.*
Sutton & Sons, Reading.—*Amateurs' Guide in Horticulture.*
J. R. Pearson & Sons, Chilwell Nurseries, Nottingham.—*Chrysanthemums.*
Dicksons (Limited) Chester.—*Vegetable and Flower Seeds, &c.*
Cooper, Taber & Co. (Limited), Southwark Street, London, S.E.—*Vegetable and Flower Seeds, &c.*

*All correspondence should be directed either to "THE EDITOR" or to "THE PUBLISHER." Letters addressed to Dr. Hogg or members of the staff often remain unopened unavoidably. We request that no one will write privately to any of our correspondents, as doing so subjects them to unjustifiable trouble and expense.

Correspondents should not mix up on the same sheet questions relating to Gardening and those on Bee subjects, and should never send more than two or three questions at once. All articles intended for insertion should be written on one side of the paper only. We cannot reply to questions through the post, and we do not undertake to return rejected communications.

Chrysanthemum Sport (A. O.).—You ask what we think of your sport from *Source d'Or*? In the form in which it reaches us we think it has a rather shabby appearance, and we are a little doubtful if even when presented in its best condition it will make a sensation. Still, try it. You say you call it *Hedgehog* because a little bristled. We should drop one of the "g's" if it were in our collection.

Books (Fruit Grower).—You can obtain three good books on fruit culture for a little more than the amount you name; one by Mr. Rivers of Sawbridgeworth, one by Mr. G. Bunyard, The Nurseries, Maidstone, and one by Mr. J. Cheal, Lowfield Nurseries, Crawley, Sussex. They contain valuable information. (C. S.).—Mr. Baine's "Stove and Greenhouse Plants" (Murray) will probably suit you. We do not know the price, but you can obtain it from a bookseller.

Seedling Chrysanthemums (R. T. C.).—You ask if "seedlings of this year which are semi-double come double next season." Seedling Chrysanthemums seldom fill well the first year, for various reasons. In the first place the seedlings are rarely grown in larger than 6 or 7-inch pots; next, we are necessarily ignorant as to how the varieties should be treated, whether they are early or late, or if the plants should be stopped or not. If a bloom comes with not more than five or six rows of florets it, as a rule, is not worth keeping; but if the bloom is promising in form and colour, even if it has an eye or centre as large as a shilling, it is very likely to fill the next year. In saving seedlings colour with breadth and length of floret are the principal items to be studied, while distinctness of form should not be overlooked.

Mistake in Dissolving Bones (T. C.).—We do not see where you have made any mistake except in using too much water, consequently too little sulphuric acid. To 2 lbs. of bonemeal, perfectly dry, add 1½ lb. of water and 1½ lb. of sulphuric acid, mix, and these if left to act on each other for twenty-four hours should form superphosphate of lime, nothing else remaining. The bones used to form the superphosphate must contain the essential phosphate of lime (55 per cent. or more), that is, they must be fresh, or at least sound, for it is useless

expecting the sulphuric acid to act on old and decayed bones that have lost the greater part of the phosphate of lime through the acids of the soil and abstraction by the roots of plants, leaving little beyond carbonate of lime. Your sample is a very poor one, not only old, but containing much earthy matter, and appears to have lain a considerable time. Use good and fresh bonemeal, and when dissolved, if you want it dry, mix with fine, dry ashes so as to form a powder.

Making Superphosphate of Lime (Bones).—See reply to "T. C." No liquor should remain at the bottom of the cask, all the bone being converted into superphosphate—a paste which is, perhaps, best mixed with wood ashes in a perfectly dry state, so as to form a rather lumpy but palpable powder, easily distributed, as well as thoroughly soluble in water. A good way to utilise bones is to place them in a cask, stood outdoors, as they are forthcoming, putting a layer of earth—say, 4 inches thick, then the bones in similar layers, sprinkling wood ashes over each layer of bones so as to fill the interstices, and so on until the cask is filled. A few loose boards may be placed over the top of the cask, but not so as to exclude air, and in twelve months or less the bones will crumble and form superphosphate—a crumbling powder—excellent for top-dressing plants of all kinds, including fruit trees, for which it is better than superphosphate prepared by dissolving bones in sulphuric acid. Any liquor remaining in the cask to which you allude is injurious to vegetation, but there ought not to be any in a properly made superphosphate.

Hard Carrots (E. T. H.).—There is a tendency in some varieties, particularly those which form part of the root above ground, to become more or less hard in places. The defect is very common this season in the earliest sown main crop roots. This is partly due to the early sowing (late March or early April). The hardness of the flesh is in no way attributable to the manure. We should not sow before the middle of April for the main crop, and even then in light silicious and calcareous soils the roots are liable to become overgrown—that is, advanced towards the seeding state, and so have more or less hard cores or parts that do not become tender without extra long boiling. In such soils it is sometimes necessary to sow early in July to produce a late crop; the roots then attain to a good useable size, and are tender and delicious when cooked. James' Intermediate is one of the best garden Carrots, the root being formed below ground or the crown level with the surface, and it keeps excellently when stored in moist sand or light soil in a cool place. There is no edible value in that part of a Carrot grown out of the ground, and we advise you to grow those only for table use that produce their roots within the ground, say Early Scarlet Horn for early use, and James' Intermediate Scarlet for winter supply.

Early and Late Chrysanthemums for Market (F. H.).—A successful grower of blooms and sprays for market gives the following information. Presuming that by the term "early," varieties are required to bloom in September, six are named as being suitable. Some of the Desgranges may be disbudded if fine individual blooms are in request, though fleecy sprays are sometimes more profitable. Most varieties answer either way, except the "Tecks," which in all cases must be disbudded. The letter "D" is appended to those which are good for that purpose. *Early varieties.*—Madame C. Desgranges (D) and Mrs. Pitcher, white; Mrs. Hawkins (D), clear yellow; Mons. Gustave Grunerwald (D), rich pink; Golden Shah, bright golden yellow, and Mr. Burrell (D), primrose. *October kinds.*—La Vierge (D) and Mrs. Cullingford, white; Pynaert Van Geert (D), golden yellow; Roi des Précoces, dark crimson; Alexander Dufour, rich purple, and Mons. Wm. Holmes (D), crimson scarlet. The Desgranges may be had through October by stopping the plants later; these also make good pot plants for market use, as do Mons. Gustave Grunerwald, La Vierge, Roi des Précoces, Alexander Dufour, and Mons. Wm. Holmes. *Late varieties.*—Princess Teck (D) and Boule de Neige, white; M. Bergman and Golden Madame Pages, yellow; Massalia, bright crimson; and Julie Lagravere, red. In addition to these Admiral T. Symonds, single yellow, and Frank Wilcox, reflexed, bright chestnut red flaked with gold, are both good and should be included.

Orchid (T. T. W.).—Judging from the flower of your Cypripedium insigne the variety is either a very poor one or the plant is in an unhealthy condition. We are inclined to think the latter is the case, and if the growth were strong and well developed the flowers would improve. If the pots are very full of roots the plants may need repotting, and this is best done in the early part of February. The roots often cling tenaciously to the pots, which in that case would be broken, and portions of pot that do not fall off naturally should be placed in fresh pots with the roots adhering. All old and decayed potting material should be carefully removed. If this cannot be done without seriously disturbing the roots place the plants in tepid water and carefully work the soil from amongst the roots. Allow the plants to drain thoroughly before they are repotted. The new compost, consisting of rough peat, charcoal in lumps, broken crocks and living sphagnum moss should be worked amongst the roots. The fibre from loam will do if peat cannot be obtained. When finishing put a layer of moss on the surface and pieces of peat and moss between all the growths as far as possible for inciting fresh roots. Very careful watering will be needed after potting. The plants should be kept in a cool house until February, and then introduced into gentle warmth, say 45° to 50° at first, gradually rising to 60°, providing shade from bright sunshine and a moist atmosphere are needed. When the new growths are well developed the plants should be gradually hardened to cool greenhouse treatment, where they will complete the development of their growths. During early autumn or winter if the plants are introduced into a temperature of 50° they will

soon push up their flowers. This Cypripedium should flower annually from every fully developed growth. If your plants are in a healthy condition at their roots you may improve them very much if grown according to the advice given, without repotting, by applying weak liquid manure every time they need water during the season of growth. They should be kept rather dry than wet at the roots during the winter.

Names of Fruits.—*Notice.*—Special attention is directed to the following decision, the object of which is to discourage the growth of inferior and promote the culture of superior varieties. *In consequence of the large number of worthless Apples and Pears sent to this office to be named, it has been decided to name only specimens and varieties of approved merit, and to reject the inferior, which are not worth sending or growing.* The names and addresses of senders of fruit to be named must in all cases be enclosed with the specimens, whether letters referring to the fruit are sent by post or not. The names are not necessarily required for publication, initials sufficing for that. Only six specimens can be named at once, and any beyond that number cannot be preserved. (J. D.).—Probably Lord Lennox. (George Steel).—1, Winter Strawberry; 2, Yellow Ingestrie. (M. W. Chessington).—Ribston Pippin. (W. W. C.).—1, Cellini; 2, Hollandbury; 3, Gloria Mundi; 4, Sturmer Pippin; 5, Hanwell Souring; 6, King of the Pippins. (A. Z., Thirsk).—Tower of Glamis. (G. T. A.).—You have overlooked the above conditions. On receipt of your name and address the fruit will be examined. It is essential that the districts be named in which fruit is grown, as the information leads to the more certain identification of varieties.

Names of Plants.—We only undertake to name species of plants, not varieties that have originated from seed and termed florists' flowers. Flowering specimens are necessary of flowering plants, and Fern fronds should bear spores. Specimens should arrive in a fresh state in firm boxes. Slightly damp moss, soft green grass or leaves form the best packing, dry wool the worst. Not more than six specimens can be named at once, and the numbers should be visible without untying the ligatures, it being often difficult to separate them when the paper is damp. (H. M.).—1, Tillandsia (Vriesia) carinata (see page 547), not an Orchid; 2, the Climbing Fern, Lygodium scandens. (T. K.).—Lælia rubescens, var. rosea (syn. L. acuminata).

COVENT GARDEN MARKET.—DECEMBER 21ST.

Trade slow, good supplies with no alteration in prices.

PRODUCER AND CONSUMER.

CORN growers have at last complained of the low price of Wheat to some purpose. Public attention is now fully aroused, not to the justice of the farmer's plea for aid, but to the fact of the comparatively low price of Wheat and high price of bread. The poor man's cheap loaf proves to be a very dear one, and the millers and bakers are accused of robbing the working man of this kingdom of 100 per cent. in the cost of his staple article of food.

We gave prices of the 4-lb. loaf at different places in our last article to show how entirely fanciful they were, and that the price of Wheat was simply ignored by the bakers. In a recent discussion of this important matter in the *Times*, the question was asked why the quartern loaf costs 5½d. when Wheat is 27s. the quarter or 3s. 4d. the bushel; whereas, about 1852, when Wheat was 60s. the quarter or 7s. 6d. the bushel, the price of the quartern loaf was 5½d.

It is shown how, in the reign of Henry III., A.D. 1267, an Act was passed to regulate the price of selling bread by statute, making the price vary according to the varying price of Wheat, but leaving a reasonable profit for the miller and baker. This Act continued in force until 1836, when the Legislature threw the trade in bread open to free competition.

In 1709, during the reign of Queen Anne, the weight of the 6d. loaf, according to the price of Wheat, was as follows:—

Wheat at 3s. 3d. a bushel, 6d. loaf	10 lbs. 11 ozs. 2 drams.
" 3s. 6d. "	9 lbs. 14 ozs. 4 drams.
" 7s. 6d. "	4 lbs. 10 ozs. 2 drams.

In 1758, in the reign of George II., the price stood as follows:—

Wheat at 3s. 3d. a bushel, 6d. loaf	9 lbs. 7 ozs. 11 drams.
" 3s. 6d. "	8 lbs. 11 ozs. 0 drams.
" 7s. 6d. "	4 lbs. 0 ozs. 3 drams.

The statute also regulated the price per quartern loaf as follows:—

Wheat at 3s. 3d., the quartern loaf	2½d.
" 3s. 6d. "	3d.
" 7s. 6d. "	6½d.

Wheat is now 3s. 4d. a bushel. If the assize of bread were in force a 6d. loaf should weigh nearly 9 lbs., and the price of the quartern loaf should be about 2½d., after leaving the baker and miller a sufficient profit. By the statute of 4th George IV., cap. 50, the baker and miller were to share between them at the rate of 13s. 10d. a quarter, and the selling price was to be calculated after the addition of that sum to the price of Wheat. The inevitable deduction from these facts is that since 1852, notwithstanding the advantages of improved manufacture, and the enormous adulteration which freedom of trade invariably brings forth, the price of bread has been exorbitant and unfair.

We earnestly commend these facts to the serious attention of farmers who, while crying to the Legislature for aid, allow salesmen, and tradesmen, butchers, millers, bakers, cattle dealers, and auctioneers to flourish exceedingly upon the enormous profits which they acquire through the producers' inertness and lack of business capacity. Whose affair is it but the producer's to see how his corn and cattle are disposed of, to mark the difference between the price he gets and that paid by the consumer? Unfortunately straitened means have deprived very many farmers of staying power. What does the forced sale of damp Wheat soon after harvest, of lean store cattle at Michaelmas, point to but dire necessity? Money must be had at any cost, but the sacrifice involved in forced sales only staves off the inevitable, and serves to accentuate the keen sense of depression, which the popular idea asserts comes from oppression, from hard measure dealt out to the farmer by open markets and burdens upon land.

Where can a remedy be found for so unsatisfactory a state of things? Everything points to co-operation; even the recent abortive Conference points that way. We want co-operative butter and cheese factories, outside the legitimate milk radius of large towns. What an immense difference would this make to all dairy farmers! Milk would become higher in price, simply because the present blind competition would cease; the cost of carriage would be much less; instead of sending milk to London from a distance of between one and two hundred miles, as is now done by so many farmers, they would turn with their milk to their own factories. Is it not a significant fact that during the prevalence of an agricultural depression so severe and so prolonged the cows of the Irish co-operative farmers have become 30 per cent. more valuable simply through the establishment of dairy factories? Let British farmers look to this; let them also take to heart the lessons taught by the profits of those who come between themselves and the consumer, and see if they cannot do something for themselves in this direction.

WORK ON THE HOME FARM.

Never has the value of uplands for sheep been more apparent than during the past week, with its trying changes of weather. Floods have been prevalent in the valleys, and much of the land near watercourses has been submerged, yet we have seen sheep folded on mustard with much of the field under water. They should have been removed at any cost, rather than run the risk of foot-rot and other evils, which they did. On upland pasture good work is now being done with sheep folds; the pasture is sound, there is no hurtful accumulation of water in the soil, the sheep are thriving, and the land is being steadily enriched for next summer.

Much drainage of inferior pasture is now in hand; many of the drains running full of water soon after they are made afford satisfactory proof of the necessity of this work. The draining will be followed by a dressing of mineral manure. Both for economy and efficiency, it has become a matter for consideration whether to use basic slag, or super-phosphate with a mixture of bone flour. In ordinary soils the latter mixture of phosphatic manures answers very well indeed. There are one or two facts which help to guide us in this matter. On soils rich in humus, and lacking in lime, basic slag is the most effective source of phosphoric acid. No plant can appropriate soluble phosphate (mono-basic); plants can only take up tribasic salts. In ordinary soils the soluble phosphate is quickly converted into very finely divided gelatinous tribasic phosphate by the carbonate of lime present, of which there will be from 20 to 40 per cent. In peaty and vegetable soils the carbonate of lime falls below 1 per cent.; soluble phosphate is not quickly precipitated, and preference is given to basic slag. Without aiming at exact knowledge, it is well to understand guiding principles in manure application, both for the sake of efficiency and economy. No nitrate of soda will be used till growth begins, then it will be used freely; and though it may be used after the other manures, its action is really in combination with that of the phosphates.

Look well to all yards, see that drains are open and in full action, avoid deep accumulations of manure or sodden litter; keep all sheds, hovels, and cow houses dry, clean, and well ventilated. Extra attention should also be given to the food and water of dairy cows.

REMARKS.

- 11th.—Overcast early; occasional sun in morning and sunny afternoon; spots of rain in evening.
 12th.—Dull early; rainy from 8.30 A.M. to noon; fine afternoon, with occasional sunshine.
 13th.—Fine and bright all day; bright night.
 14th.—Steady fine rain from 6 A.M. to 9 A.M.; gloomy morning, heavy fine rain from 2 P.M. to about 4 P.M., damp and drizzly after.
 15th.—Dull and mild morning; bright sunshine from 1 P.M. to sunset.
 16th.—Overcast, with slight fog in morning.
 17th.—Fine, but sunless.

Much warmer than the previous week, but not much above the average; a generally pleasant week.—G. J. SYMONS.

A CLEAR sky, crisp roads, with keen exhilarating air would appear to indicate the typical Christmas weather that the majority wish to see; and such it has been during the festal period now, like all things, passing away. With a breezy air without, the bright fires within become the more cheerful, and in mansion, villa, cottage, and bothy there have been healthfully joyous gatherings in which our readers have pleasantly shared; and there are more similar festivities to follow after the closing of the Old Year, in welcome of the opening of the New, according to the customs of localities.

It is well that the greatest possible number should close the old year happily, and enter on the new cheerfully; and one of the best features of the times in which we live is to see the increasing disposition that prevails on the part of the well-to-do section of the community to see some appropriate way to help to make the most needy rejoice on at least one day in their hard and anxious lives. It is pleasant, too, to note the mutual amenities of life exercised between and among families and friends in the form of mementos and warm greetings incident to the season. These in the aggregate not only make the world happier for the time, but their good influences linger like the refrain of a pleasant melody that is impressed on the mind. All this is good, both in its immediate effect and future tendency. Good wholesome sentiment lightens the toil of a work-a-day world and aids the wheels of life to turn the more smoothly.

A daily paper, in some notes on Christmas weather, has unearthed an old saw from the "Shepherds' Kalendar":—"If the sun shines clear and bright on Christmas day, it promises a peaceful year, free from clamours and strife, and foretells much plenty to come; but if the wind blow stormy towards sunset, it betokens sickness in the spring and autumn quarters." The sun did shine "clear and bright" over the greater part of our island home on Sunday last, and the wind did not "blow stormy" in the evening; but the sun set in a quiet calm. Would that this were a portent of the future—a year "free from clamours and strife, of plenty to come." Many will fear that the ancient presage is too good to be true, and that the old saw is out of date.

Some there are who foresee "clamour" in the coming year, as has been experienced in the past season, and it would be difficult to make others believe that there is "plenty" in store for them, and especially for those who engage in agricultural, not to say horticultural operations. We seem to be passing through a period of "risings," and the latest development is in the sphere of agriculture. Farmers are in trouble from the old cause—low prices, and it is true that those for Wheat and grain generally have never been so low before. But the "distress" is no new feature. Even so long ago as 1804, with Wheat at 62s. a quarter, complaints of agricultural distress through low prices were so widespread that a Committee of the House of Commons was appointed to inquire into it. Again, from 1821 to 1828 we find nothing but reports of "extreme distress and great agitation among farmers," with Wheat ranging from 56s. to 68s. a quarter, and House of Commons' committees were busy in seeking the cause for the trouble. Coming nearer, we find that in 1833 agricultural distress was mentioned in the King's speech in opening Parliament, and another Committee appointed. Wheat

had then fallen to 52s. 11d. a quarter. It fell to 48s. 6d. in 1836, and a Committee of the House of Lords was formed to inquire into the "extreme distress" prevailing; but then when the price of Wheat rose to upwards of 50s. in 1844 the report is "distress of farmers, destitution of labourers, and incendiarism." Many of our readers can well remember the turbulence of that time, never to return again, we hope.

Agricultural distress would seem to be perennial, and in some respects not a little inexplicable. It is with us now, and we regret it extremely. What is known amongst growers of food and manufacturers of articles as overproduction leads to periodical depression in various trades, and compels those who are engaged in them to change their methods or succumb. It is the same in the raising of crops or stock, and changes and modifications both on the part of farmers and landlords become inevitable. Having regard, then, to existing facts we are not sanguine that the late fine Christmas weather will prove the precursor of tranquillity, and "plenty to come," or at least to come quickly.

That a better state of things will eventually be brought about may be regarded as certain, but in the meantime many persons engaged on the land will find it hard to live. New methods will force themselves to the front, and artificial obstacles of a removable kind will be brushed aside when the country demands their removal. Meanwhile those farmers will act the wisest who do the best that can be done under the existing circumstances. They are simply competitors with producers in other lands, and must strive incessantly to excel them both in the bulk and excellence of their produce. Do they do this now? As a body we fear they do not. There is great room for improvement, and a few enterprising spirits are showing the way. Our land, taken in the bulk, is capable of far higher yields than are obtained from it, and a great increase in the value of food products ought to be, and will be, forthcoming in due time as necessity compels to renewed effort on more intelligent lines. Exhausted land and low farming on old stereotyped methods is the road to ruin; superior cultivation, enriched soil, and well managed crops the surest path to recover the lost supremacy.

Farmers will have to take a lesson from our best gardeners in the cultivation of the soil; then, with the best methods of stocking, cropping, and distribution, and generally making the best of their resources, better results will surely, if slowly, follow. Only the very best workers in gardening can realise anything like a satisfactory return for their outlay and labour; the impoverished and lethargic, who adopt slipshod methods, being bound to collapse sooner or later, and in the meantime the land runs out, not to be easily restored. It is just so with farmers. Capital, in proportion to the extent of their obligations, knowledge, energy, sound judgment, and keen business capacity, are the requisites of success in these keen competitive days, and in the absence of those qualifications it is doubtful if any possible fiscal changes, including further reductions in reasonable rents, will suffice to bring prosperity.

What we desire to impress on all who are engaged in the cultivation of the land, on a large scale or small, is the desirability of increasing its fertility—making it capable of a greater yield of what the community desires, and to meet the requirements of the public in the fullest and best possible manner. Land improvement should be the aim of all, and the improver will be the first to benefit, while there is not much to fear in these days that he will be deprived of the advantages he derives by his intelligence and skill. We must not "fear" but fight the "foreigner"—excel him as we ought to do, and can do with many things in meeting the wants of our population. Let those who can afford it join in any legitimate agitation they will in educating the public; but the most diligent home workers will win the best share of whatever reward may be forthcoming from platform efforts and legislative acts.

The present portents, the old saw notwithstanding, are not

bright, but they are not hopeless; and now, when good feelings should prevail, after what, we trust, is the experience of the majority, in their having spent Christmas in a wholesome, joyous way, we shall hope there will be a community of effort to tide over present difficulties, and thus make the future better than the past for our grand old country. Our best wishes to all.

SCENTED-LEAVED PELARGONIUMS.

THESE old and at one time neglected plants have made a distinct advance in popularity during the last few years, and although the majority of them are not very showy, they bid fair to become as much the "rage" as *Malmaison* Carnations have been. No one can dispute with much show of reason that they are extremely useful, supplying at the same time—as many varieties do—leaves and young shoots, which are deliciously scented, as well as elegant or quaint in outline. The flowers, too, in some varieties are fairly showy, and among the various sections of this family a good variety of colour already exists to work upon. I think, therefore, that we may reasonably look forward to the time when scented-leaved *Pelargoniums* will, in addition to the good qualities they are now valued for, possess flowers approaching in brilliancy to those which *Zonal Pelargoniums* at the present time produce. I doubt not that some of our shrewd hybridisers will, if possible, work great improvement in the direction indicated, now that they find an increasing demand for this class of plants.

The supply in many gardens, where special attention has not been given them, is not equal to the demand, consequently the few plants in stock are so persistently denuded of leaves as to give them but little chance of making vigorous growth, such as they will make when grown under favourable conditions. These plants are great favourites here, and we are now engaged in working up a large stock, which during the last twelve months have made unusually good progress. During the winter and spring months a heated pit is devoted to their growth, and when the plants require more room than the pit affords they are drafted into the conservatory, where they prove useful in a variety of ways. There is generally a great scarcity of good leaves and young shoots during the early spring months, as anything so useful in the way of greenery is cut rather hard during the winter. To obviate this I set apart a certain number of plants solely for cutting purposes; these are cleared of all available leaves and shoots as they are wanted. When a sufficient number have been so treated they are cut back to within a few inches of the old wood, and kept close to the glass in heated pits in the winter, and in the open air during the summer months, in each case keeping the soil in the pots somewhat dry till young shoots push into growth, when the plants are shaken out, the straggling roots cut away, and are placed in pots one or two sizes smaller, being afterwards shifted as required, always taking care not to cut them again till they have made ample growth. By following this course throughout the year plants in the right condition for cutting are always on hand.

I find from the present time up to the new year is a favourable period during which to cut down several plants, as they break into growth by the beginning of January, and if kept in an intermediate temperature for a couple of months, then gradually inured to cooler quarters, they supply good shoots for cutting during May and June. If cuttings are not plentiful pieces of stem with a couple of joints may be inserted rather closely together in sandy soil. These make very good plants in time, but are of course much longer in doing so than cuttings of the usual type. The chief supply of these should be inserted in August, when cuttings are readily obtained; these form useful plants in large 60-pots for decorative purposes from November onwards, while others rooted at the same time, stopped twice, and shifted into 5-inch pots, develop into dense bushy plants by April.

Where large plants are required, after stopping a few times to lay the foundation, no further pinching will be required, except in the case of shoots which show a tendency to grow unduly strong at the expense of weaker ones. The points of these should occasionally be taken out. The main shoots being staked out, and thinly disposed they will then produce vigorous side growths, and develop into sturdy specimens. I was much struck with the group of fine plants exhibited at the great fruit show held at Earl's Court in August last. They were shown by Mr. J. Hudson of Gunnersbury House, who generally grows to perfection whatever he takes in hand. Standards of various heights and sizes are extremely useful, and are always highly prized. I find the well-known Oak-leaved variety *P. quercifolium*, also *P. Radula*, are well adapted for growing in that form. All that is necessary to secure the requisite forms is to grow the plants strongly, confine them to a single stem till the required height is reached, when the point should be taken

out, and the side shoots afterwards produced be stopped twice. I ought to have mentioned that the single stem should be fastened to a straight stake as growth proceeds, and the side shoots rubbed out to secure a clean stem, the main leaves being left to strengthen it and facilitate growth.

A mistake sometimes made in the cultivation of scented-leaved *Pelargoniums* is to grow them in too poor a soil. I have tried many composts for them, and find they thoroughly enjoy liberal treatment. The mixture I recommend consists of two parts good loam, one of leaf soil, one well decayed manure, or that from a spent Mushroom bed, with a little burnt refuse, soot, and sharp sand added. The growth made in a compost of this description is vigorous and healthy, and does not easily fall a prey to insects.

When grown in light houses or pits during the summer months judicious syringing plays a most important part in promoting health and securing cleanliness. A thorough syringing given once a day during the summer months will generally keep the principal insect pest, green fly, at bay, but during the winter months an occasional fumigating will be necessary to keep such in check. Where isolated plants become infested with these insects, they may be quickly destroyed by a timely application of some of the advertised insecticides, which are invaluable for such purposes.

Some of the best varieties of scented *Pelargoniums* to grow are the following:—*Capitatum*, *quercifolium minor*, *Fair Ellen*, *tomentosum* (a very strong grower with woolly foliage, which is scented with peppermint), *Dale Park Beauty*, *Lady Plymouth* (variegated), *Lady Scarborough*, *Denticulata majus* (very finely cut foliage, suitable for buttonholes), *Radula major*, and *Pheasant's Foot*. In addition to these there are several good hybrids raised from the old *Rollisson's Unique*. All of these have more showy flowers than the preceding. Two of the best are *Crimson Unique* and *Scarlet Unique*.—H. DUNKIN, *Warwick Castle*.

WELLS CHRYSANTHEMUM SHOW.

WE are informed that the Wells (Somerset) Chrysanthemum Show will be held on November 7th and 8th next year.

HULL AND EAST RIDING CHRYSANTHEMUM SOCIETY.

WE are informed that the date of the next Show has been fixed for Wednesday and Thursday, November 15th and 16th, 1893.

JOHN LAMBERT.

IF Mr. Lambert will examine the catalogue of the N.C.S. he will find that it does not recognise such a variety as John Lambert. In that case no bloom is entitled to such a name at any exhibition where the nomenclature and the judges are ruled by the definitions laid down by the N.C.S.—EDWIN MOLYNEUX.

CHRYSANTHEMUM W. W. COLES.

"E. M." (page 531) was quite right in assuming that the yellow blooms appeared on several plants of this variety. It appeared on three out of the four plants that I grew, and one plant with three shoots had two yellow blooms, the other being true. The buds were all taken between the middle and the end of August, and were of course crown buds. Appearing on three plants simultaneously, I do not attach much importance to it as a sport, but thought it was probably subject to this variation, and "E. M." confirms this supposition.—J. H. W., *Leicester*.

STANSTEAD WHITE.

THIS superb variety should be grown in quantity for Christmas decoration, when white flowers are so much in demand. It is the best variety for the purpose that I know of, and its fluted partially incurved florets gives to it a distinct light appearance when arranged in vases. This cannot be said of many otherwise excellent varieties, their blooms being too dense and lumpy for any other purpose than single specimens. We get good late blooms of Stanstead White by growing the plants in the ordinary way and cutting them down the last week in May. From three to eight shoots are allowed to each plant, and the first buds that show are taken.—J. H. W., *Leicester*.

WHITE ETOILE DE LYON.

LAST season I thought I had a novelty in a pure white sport of *Etoile de Lyon*. At the same time I saw that someone else had also the same, and named it *Miss Lilian Cope*, and it now seems that this "new kind" has reverted back to the original. This, I think, is a misfortune. I obtained from my sport a few cuttings from the stem (cut down hard), and they grew well last summer, but not one has proved a true white. It was very pure last year, and the plant

which was grown for decorative purposes, certainly looked curious with five lilac and four white blooms. The average size of these nine blooms was about 8 inches in width.—A. HARDING.

VIVIAND MOREL FOR GROUPING.

THIS is undoubtedly one of the finest varieties we have for grouping purposes. At the Brighton Show this year the first prize group contained no less than seventeen large massive blooms of this sort alone. As they were placed together in the centre of the group, the display was remarkable. The plants were about 4 feet high from the ground including the pots; the colour of the blooms was extremely rich for the variety. The foliage was all that could be desired, and made a delightful setting for the blooms, which were large and full, with sufficient droop in their florets to make them unusually showy. The group in question was composed of decided colours, such as Fair Maid of Guernsey, Peter the Great, Etoile du Midi, Jardin des Plantes, and Elsie. All were massed in their several colours, and a striking effect was produced, and by none more than Vivian Morel.—E. MOLYNEUX.

MRS. L. C. MADEIRA.

THE Chrysanthemum bloom I left at your office is an American incurved, raised, I think, by Mr. R. Craig of Philadelphia. It is named Mrs. Lewis Childs Madeira or Mrs. L. C. Madeira. It was first imported into this country last spring. It bears the reputation of being the best incurved show flower ever raised in America. It appears to be rather late in blooming, but that may be owing to its late arrival on this side. It is of fairly good habit, splendid in colour, deep orange yellow deepening at base of the petals to apricot. The blooms are solid, but a little irregular in petal, and like Jardin des Plantes. The bloom is the first that opened from rather a weak plant. When fairly grown from good cuttings I am of opinion it will make a good show flower.—ROBERT OWEN.

[The bloom exceeds 4 inches in diameter and 3½ inches deep. It is very solid, rather too full of florets, and a little confused. The colour is extremely rich, and the variety appears worthy of trial by the fraternity.]

CHRYSANTHEMUM MRS. ALPHEUS HARDY.

IN reply to "R. M." (page 532) this grand variety requires very careful treatment to secure good exhibition blooms. It does not require such large pots as are generally employed. Great care must also be taken by artificial feeding. I prefer taking the buds two or three weeks earlier than the general varieties.—C. F.

THIS interesting Japanese variety is still the best of the hirsute section in spite of the numerous introductions. There is something so chaste about it which is not seen in others. A white sport from Louis Boehmer is claimed to be superior, but in my opinion the florets are not massive enough to eclipse the original variety when seen at its best. The new comer may be a better "doer." Mrs. A. Hardy has been exhibited numerous during the past season, but the general quality has not been good. The finest blooms that I met with during a rather extended tour of the best shows was at Windsor, where a special prize was offered for six blooms, and, strange to say, every one of the twelve blooms exhibited were perfect. Is not this an instance of what the offering of prizes will do towards the cultivation of any particular variety, even when it is difficult to produce. The blooms referred to at Bristol were the result of the offering of a special prize. The habit of this variety is naturally weak, it being necessary to insert the cuttings in good time; they should be strong. Smaller pots than are usually employed are the best, those 8 inches in diameter being large enough. Neither does this variety require so much feeding as any other. By topping the plants the first week in April, buds will be produced in August; these give the best blooms. As the wood is rather tender keep the plants longer than usual in the house in spring.—E. MOLYNEUX.

NATIONAL CHRYSANTHEMUM SOCIETY—THE "BEAUTY OF EXMOUTH" CASE.

VERILY the ways of the N.C.S. are peculiar. A Sub-Committee is appointed to "investigate" a charge made against a member of its Floral Committee; the result of the "investigation" is, that after meeting three times, its members consider the matter settled by accepting from the member complained of a statement to the effect that the main facts of the charge are false. Truly, "the mountain hath laboured," &c. What a saving of time and expense if all our judges and juries would adopt the same course! But would the public feel that justice to both sides had been done? Apparently the majority of the Committee are satisfied with the result of the "investigation." But all fair-minded persons must consider the case is not done with until the charge is either proved or refuted by facts.

In answer to the report of the Sub-Committee, permit me to state that I am prepared to swear in the most solemn form of oath which can be administered that the main facts of the charge are true, and learning some weeks ago the substance of the report I wrote Mr. Dean to this effect, but I do not gather that he stated as much to the Committee on the 19th inst.

What a dread that Sub-Committee has of "libel." We are informed that they could not publish the name of the (alleged) offending member. I did not understand they were appointed to consider this question at all, but simply to investigate a charge which they had before them in precise and definite terms. Why the cry for publication of the name

of the individual? The matter does not affect the *Journal of Horticulture*, but the N.C.S., and the Committee know as much now as they would if the name were published.

Perhaps it may not be amiss for me to quote the concluding paragraph of a letter which was received by me from Mr. Dean:—"I am an older man than you are, and can therefore presume to give you a little wholesome advice. Do not throw about charges against committees and men wildly as you appear disposed to do. You may not be able to substantiate these if called upon to do so, as is not unlikely you will, and then your position may become one of considerable embarrassment to you." To this I replied I was most anxious to be called upon, and I have always been ready for examination.

Since then I have been favoured by Mr. Wells with the correspondence between Mr. Dean and himself respecting "another member." Among it I find the following from Mr. Dean:—"The enclosed letter appears to me to contain a serious libel upon a member of the Floral Committee of the above Society, and in mercy I return it to you, and advise you not to write in such a way again." With this was returned a letter which Mr. Wells had requested Mr. Dean to place before the Committee of the N.C.S.

Although Mr. Wells repeatedly requested his case to be brought before the Committee, he was informed by Mr. Ballantine (the Chairman of the Floral Committee) and Mr. Dean that his matter was a "personal one." However, Mr. Wells was of a different opinion, and ultimately did get his case before the Committee, with the result that the member Mr. Wells complained of "was condemned for his action," and this in spite of the Chairman's and Secretary's opinion that he (Mr. Wells) had no case.

By the report of the Sub-Committee, I consider I am stigmatised as a person who has brought an unfounded charge against another. Grant me space to add that I personally had no grievance with anyone, as my "Beauty of Exmouth" was certificated. I only considered I had a duty (unpleasant though I find it) to perform towards the N.C.S. and the Chrysanthemum world generally; but the result of the "investigation" compels me now to leave no stone unturned until I have cleared my own character.—W. J. GODFREY, *The Nurseries, Exmouth*.

[We have other letters on the cases referred to, but extreme pressure, consequent on the holidays, with the preparation and publication of the index, forbids their insertion this week.]

THE NATIONAL CHRYSANTHEMUM SOCIETY.

MR. DEAN has invited Mr. Pearson to supply him with the names of any candidates he considers fit to serve on the Floral Committee of the National Chrysanthemum Society, and promises to see they are duly nominated for election. I hope Mr. Pearson will promptly avail himself of this offer, and make a good choice of well-known good growers, as it will not only add prestige to the Society, but test the "circle" or clique question. Surely other members are entitled to the same privilege as Mr. Pearson. I do not know the duties of the present Secretary, but the late Mr. Holmes used to apprise country members of the principal meeting.

As a member of the National Chrysanthemum Society of some years' standing I naturally feel interested in its welfare, and feel sure if the Committee wish to retain the confidence of its country members their doings must be strictly fair and wholly above suspicion. They need not exclude the Press from their meetings, and destroy the only medium available to absent members to know the Society's transactions.

If we consider the endless number of certificated varieties that are consigned to the rubbish heap after the first year's trials amongst the growers, it seems to suggest the important necessity of some improved method of awarding certificates to new untried sorts. But instead of a first-class certificate being a genuine guarantee for a first-class variety, the certificates appear to be about equally distributed between a few of the trade; but if the Floral Committee were composed more of growers, they would not risk their reputation by giving awards to worthless sorts. The "National" holds two Chrysanthemum shows yearly at the same place, both to suit the southern climate. Why not hold a show to suit the northerners, where the colour of the Chrysanthemum is rarely seen before all the southern shows are over? This reminds me of the farce of a National man, who has never grown a Chrysanthemum out of the London smoke, writing to a northern affiliated society the most suitable time to hold their show, instead of recommending them to consider their own climate and locality. He thought the day following the Aquarium Show the most suitable. As the advice was from London it was accepted, and the society had the satisfaction to see their prizes going away from their best supporters. When at the Aquarium Show last November I asked the opinion of one qualified to know whether he considered the present show up to the usual standard. He replied without hesitation, "Certainly not. What would this be if it was not for trade exhibits?"—J. H. GOODACRE.

NEW CHRYSANTHEMUMS.

(Concluded from page 532.)

Col. W. B. Smith.—Were it not that William Seward supplies a colour much wanted I should be inclined to give this variety the first place in point of merit. The blooms are each 8 inches in diameter and 5 inches deep without any sign of coarseness. The florets have a semi-drooping tendency, the centre quite full. The colour is new—a golden bronze with a terra cotta suffusion. The florets as they unfold incurve slightly with a twist, but on development this gradually passes away. I do not think the engraving in the *Journal of Horticulture* (page 421)

quite does the variety justice. It was evidently figured from a partly developed bloom. The growth is all that could be desired, from 4 feet to 5 feet, without being topped. Those not already in possession of this novelty should lose no time in adding it to their collections.

Mrs. Charles Blick.—This belongs to the Thunberg style of flower, being quite of that colour, but less twisted or curled than that grand old variety. Altogether this new introduction is quite one of the best yellows in cultivation.

Comte F. Surani.—An exceedingly dwarf variety. I had good blooms on plants 2 feet high. The colour is white, mottled and edged with rose, which fades somewhat with age. The flower is of the Belle Paule type, having semi-drooping, smooth, and flat florets.

Madame Octavie Mirbeau.—Belongs to the same class or style of flower as the foregoing, but the florets are longer, more drooping, and have more rose in the colouring. It is a novelty of the first rank.

Il Trovatore.—This has broad flat florets, the colour is peach in the centre, but paler towards the margin, medium sized bloom; very pretty.

W. P. Routh.—A yellow, of the style of Avalanche in build, very promising.

Duke of York.—This belongs to the incurved Japanese section. The colour is magenta or purple on the inside of the florets, the reverse silvery; the blooms are large; promising as an exhibition variety.

Rosy Morn.—An exceedingly pretty variety belonging to the reflexed Japanese section, the colour a delightful shade of peach blossom; as a decorative variety nothing could appear more promising.

Lord Brooke.—I strongly recommended this variety last year, and it has quite come up to expectations. No variety is more striking in appearance in a stand when in good condition as Mr. Fowler had it several times. The colour is bronze with an edging of gold.

Madeline Davis.—Blush white narrow incurving florets, very neat and promising.

Barbarossa.—This has semi-drooping narrow florets, deep pink in colour.

Mrs. Herbert Fowler.—The colour of this is deep rose, mottled and striped with white. A full flower of much promise.

Hetty Dean.—This belongs to the decorative class. The blooms are full, solid and the purest white. Grown as a bush it ought to be extremely useful.

Mrs. W. H. Atkinson.—The colour is terra cotta red, reminding one of Triomphe du Nord, broad flat florets; altogether a flower of much promise.

C. H. Simmons.—This is a sport from the old La Triomphante. It opens up quite a distinct break in colour. Each floret is striped once and in some cases twice, with soft primrose yellow, rendering it novel and interesting.

George Savage.—A seedling from Mrs. Alpheus Hardy, but without the hairs. The florets are narrow and incurved closely, making a full solid flower, pure white in colour.

The Tribune.—Colour soft primrose yellow, therefore this variety is a gain to the exhibition stand. At present there is a scarcity of blooms possessing that colour. The florets are flat, forming a full centre. Altogether this is a most promising variety.

W. K. Woodcock.—A broad petalled flower of the reflexed Japanese type. The colour brick red with gold tips; it should make a capital front row bloom for exhibition.

Mrs. Hubbuck.—Deep carmine in colour, the reverse silver, which is shown by the tips of the florets incurving. A full massive flower.

Waban.—Incurved Japanese, fully 8 inches in diameter, thick fleshy florets of a pleasing pink colour.

Lizzie Cartledge.—In colour this reminds one of W. Tricker when the latter is well developed, with perhaps a shade more rose in it. The reverse of florets silver.

Professor Whitmaek.—This is of the style of M. Freeman in the formation of its florets; the colour is deep rose or magenta, the tips show the silver reverse.

Mrs. Harman Payne.—A giant in size, the colour deep rose with a silver reverse.

Kentish Yellow.—As a decorative variety this possesses much merit.

Mrs. J. Jones.—Incurved Japanese, broad florets, of a peach colour.

Princess Victoria.—Blush white, very deep in build, reflexed Japanese section.

JAPANESE ANEMONE.—*Mrs. Lawton.*—The guard florets, white with blush tips, are broad, the centre or disc pale pink; very promising.

Madame Nathalie Brun.—Disc pure white and full; the guard florets are thin in texture, colour pale pink.

POMPOX.—*William Kennedy.*—Rich crimson shaded amaranth in colour, but somewhat spoilt by its extra size, being in reality classed as a hybrid.

SINGLE VARIETIES.—*Snow Wreath.*—The purest white and best form of flower.

Mrs. Laplin.—One of the largest flowering varieties, pure white, loose florets.—E. MOLYNEUX.

CANKER ON FRUIT TREES.

THIS is a most important subject to fruit growers. In a certain soil with which I am acquainted Apples and Pears are liable to canker, and Cherries to gum; Plums, Gooseberries, and Black and Red Currants do well. As the same varieties of Pears and Apples canker on one soil and do not do so on another, it seems a correct deduction that when they

canker there is either something injurious in the soil or something lacking which they need. The following is the late Dr. Voelcker's analysis of the soil mentioned above:—

* Organic matter and loss on heating	3.64
Oxide of iron	3.38
Alumina	4.45
Carbonate of lime	3.91
Sulphate of lime	0.26
Magnesia	0.67
Soda	0.07
Potash	0.51
Phosphoric acid	0.24
Insoluble siliceous matter	82.87
			100.00
* Containing nitrogen	0.17
Equal to ammonia	0.21

It will be noticed that there is a large proportion of oxide of iron. As, where there is more iron still in the soil in the same locality, Apples canker still more, and, as it has been mentioned by some of your correspondents, from time that Apples canker where there is much iron in the soil or subsoil, it would appear that excess of this is the cause of the canker. On the other hand Mr. Tonks seems to favour the application of iron (sulphate). Is the sulphate beneficial, while the iron in its natural condition in the above soil is injurious? Or is the oxide of iron in the soil unassimilable? Would the special application of nitrogenous manures make it assimilable, or else cause it to become soluble and take its exit. Would sulphate of ammonia be a suitable manure (of course phosphorus and potash being added) bearing in mind it is a limestone soil? The soil in question has regular applications of manure, mostly from horse stables, and also yearly applications of chloride of sodium, and once recently nitrate of soda was applied.

It will be seen from the above analysis that the soil is a good one for fruit growing, yet some trees of nearly every variety of Apple that has been tried, canker, and the sorts liable to canker do so very much. I may also say that Apples, and especially Pears, are rather liable to the fungus which causes cracking. Sulphate of iron has not been tried for this at present.

Perhaps it would be well to have the fruits analysed by someone who is used to the analysis of vegetable products. If so, I shall be pleased to have the name of such a one. I shall be glad to have the opinions of others more acquainted with the subject than myself, and any information that could be gained would be of practical value to all classes of fruit growers.—WALTER KRUSE, *Leeds, Maidstone.*

POINSETTIAS.

ON page 527 (December 15th) "T. P." made reference to growing two distinct varieties of Poinsettia pulcherrima, one of these being much earlier to flower than the other. I grow a large number of these useful decorative plants, and until a few years ago used to have three varieties under the names of P. pulcherrima, P. p. major, P. p. plenissima; each of these being quite distinct in the bracts, foliage, and manner of growth. P. pulcherrima was the tallest, and this often prevented this variety being used for many purposes. The varieties known as major and plenissima were much dwarfer in habit and produced brighter and more attractive bracts. P. major appears to develop its bracts in heat naturally from the middle of October without undue forcing, while plenissima is at its best now, thus proving it to be a good successional variety, being at least quite a month later.

For general decoration I have found P. major the most useful on account of its very dwarf character. Large bracts can also be obtained on plants a foot high when grown in 48-size pots. Sometimes when grown in larger pots they will extend to 30 inches, and will make more densely double bracts, often measuring quite 20 inches across. P. plenissima has a habit intermediate between P. pulcherrima and P. major var. The flowers of both will last good over a long period if grown in a moderately airy temperature. This will also enable the plants to stand in a light position in the dwelling house for two or three weeks without injury.—B. DOCKERILL, *Elmhurst Gardens, Reading.*

It is certainly known to not a few readers of the *Journal of Horticulture* that there are two distinct varieties of these showy winter decorative plants, although, as intimated by your correspondent "T. P." (page 527) there may be others unacquainted with that fact. The varieties are valuable as affording an excellent succession, and that, too, without treating them differently to bring this about by enforced or unnatural means. Certainly the earlier flowering variety is the most valuable one of the two, because it will produce bracts with greater certainty and more freely than the other.

A fine stock of the early variety is grown annually by Mr. Iggulden at Marston, and the summer treatment of his plants and the results have induced not a few who have witnessed their sturdy growth to adopt the same course. Old plants are neither despised nor discarded, as these give a larger return and less trouble in production, glass protection being only afforded them in their early growth until they are well started. They are given air almost as freely as Pelargoniums when once they are growing well, and from that time until they are

housed the lights are dispensed with entirely. "T. P." says good plants and bracts may be grown in 7-inch pots. I have seen some at Marston growing in 48's from 12 to 16 inches in height, bearing heads of the same dimensions as their height. These were young summer struck plants of the November flowering variety.

Useful as they undoubtedly are in the month named, they are, I think, still more so in December, when there is not the same wealth of Chrysanthemums, and the nearer they approach the great winter festival the more value is set upon them, particularly in the case with those who have to supply flowers for the decoration of churches. For this work Poinsettias are much sought after, and furnish perhaps the boldest and most striking flower obtainable. They have a peculiarity quite their own as cut flowers, some standing erect and fresh for several days, oftentimes a week or more; others droop the same day or the next after they are arranged either in living rooms or in church, all being equally fresh and gathered at the same time. Such an erratic custom is very disappointing to those who have to purchase them at the high price usually charged at Christmas time. The searing of the cut end with a red heated iron immediately on being gathered prevents their drooping so quickly as they will do, even if placed at once into water, because the ends being slightly charred prevents bleeding.

The above advice has been oft repeated in the *Journal*, and I have on more than one occasion proved its soundness. I cannot, however, explain why such severe flagging should occur in some bracts, while others equally fresh when cut should stand erect for days without showing any such tendency. Perhaps other readers may be able to throw some light on the subject for the benefit of those who use Poinsettias in a cut state.—W. STRUGNELL.

IMPROVING HEAVY SOILS.

MY experience with very strong soil is different from that of Mr. Igguiden, as described on page 519. I find it is best when first taken in hand to bastard trench it at once; it is the only way I can make the land at all workable. After the surface soil is moved the depth of a fork there is below this a hard pan-like subsoil; into this the roots of no kind of crop can penetrate. To assist the quick percolation of water also from the surface it is necessary to have the subsoil broken up 2 feet deep from the surface. In this way the soil is rendered fairly dry—at least, water does not lay on the surface where the soil has been moved in the way advocated. Although the land is heavy and retentive, it is not clay exactly, but a near approach to it, being freely mixed with flint stones. When the soil has been moved to the depth named, the stones act as a percolative medium.

Drains appear to be useless in this land, owing, I suppose, to the number of stones contained in the soil. The garden when made, fourteen years ago, was drained, 18 feet apart and 4 feet deep; the pipes were covered with stones 1 foot thick, and over these were laid Thorn cuttings from the hedges. From the appearance of the drains one would think there had not been a drop of water through them since. By the addition of plenty of long manure on the top of the broken subsoil, and by adding abundance of decayed vegetable refuse, leaf soil, and road grit to the surface soil, frequently forking it over when dry, we are enabled to grow fairly good crops of vegetables and some kinds of fruit.

I also find this land is made much better and more easily managed if bastard trenched about every second or third year. Where it is longer neglected than this the subsoil "calluses," and is not favourable to the growth of anything in the way of annual crops. Cow manure I found was not the best to use here; it adds to the heaviness of the land, keeping it cooler, and obstructs quick percolation during sudden and heavy rainstorms.

Hereabouts chalk is largely employed for mixing with the surface soil, containing, as it does, a certain per-centage of lime. How much I do not exactly know, as the quantity contained in various chalks is not the same. Excellent building lime is made from chalk in some localities, but in others it is useless for this purpose. The manner of "chalking" in this part is to lay it fresh from the quarry on to the land early in the winter, frost pulverising it to a powder, when it is then forked into the surface, and acts mechanically in loosening the soil, and chemically, too, I suppose.—E. MOLYNEUX, *Swanmore*.

A CHRISTMAS PEAR.

ACCORDING to my experience, Doyenné du Comice is one of the best Christmas Pears in cultivation. The fruit, when well grown, is of a large size and most delicious flavour. Invariably, too, the tree is a good cropper, and with me gives the most satisfactory results.

To corroborate my statement regarding this Pear, I send you a few samples, which, I think, will be sufficient to prove that it is worthy of all that can be said in its favour. The Pears sent herewith were grown on a south wall in Yorkshire, and considering that this northern

county is not the most favourable for growing, you will doubtless consider them worthy of notice.—C. D., *Yorks*.

[The Pears sent by our correspondent were exceedingly fine, and arrived in splendid condition a few days before Christmas. The illustration (fig. 75) represents a well grown Doyenné du Comice, such as those referred to.]

AN ATTRACTIVE BED—WINTER CHERRY.

A PLANT not too well known, and not cultivated so much as it should be, is the perennial Winter Cherry (*Physalis Alkekengi*). Although said to be a native of Southern Europe, it seems to withstand our severe

FIG. 75.—PEAR DOYENNÉ DU COMICE.

winters. In a bed 12 feet in diameter are planted seven or eight Japanese Maples of the polymorphum type, and well coloured in the spring and summer months. They have stems about 2 feet in height, and their heads spread out 2 to 4 feet across.

Three years ago, in the month of April, young plants of the *Physalis* that were just shooting up from an old bed were planted as an edging to the Maple bed about 9 inches apart, and also a few were dotted about beneath the trees. Previous to planting two barrowfuls of decayed manure were lightly forked in, but the bed has had no other stimulant or digging since. The *Physalis* grows about 18 inches in height, and during the summer is not attractive, only as a green plant, but it is in the months of October, November, and even December that it is so telling. Even at the present time this bed, with its hundreds of leafless stems, but covered with its bright orange red calyces is very effective at 200 yards distance, quite a blaze of colour.

It is an old-fashioned hardy perennial, and has been found eligible in a class for hardy perennials at the Royal Horticultural Society in the month of October. The foliage is all off the Maples now, or the undergrowth of *Physalis* would not show up so well. Anyone who has

a sunny border or bed is advised to grow it for the sake of its curious fruit. The roots creep and spread; if the plants encroach too much on other things they can be easily forked out. I have seen it encroach on a broad gravel path and left to grow, and everyone who saw it in the late autumn months admired it, and some would remark, "What a curious plant." To obtain the strongest and best stems it is advisable to replant every three or four years in fresh ground about the month of April, or when about an inch in height.

It is useful for decoration purposes, harvest festivals, or for mixing with dried Lunaria (Honesty) and plumes of Pampas and other Grasses. I have now beside me a bunch of the Winter Cherry that was cut fourteen months ago, and still looks well.—A. HARDING.

OUR INDEX.—The insertion in the present issue of an index to the matter in the *Journal of Horticulture* during the past six months compels us to defer the publication of articles and letters of considerable interest. We desire to thank all our correspondents, and, at the same time, to assure them that promptitude or otherwise in publication in no sense indicates the measure of our appreciation of their communications.

— THE WEATHER IN LONDON.—The present week opened bright and seasonable in the metropolis, a sharp frost having occurred on the Saturday night. In the suburbs the thermometer registered 14°, or 18° of frost. Monday and Tuesday were also frosty, though on the morning of the latter day a thick fog prevailed. It cleared during the day, and froze hard at night; but on Wednesday it was very foggy with little frost.

— WEATHER IN THE NORTH.—4°, 11°, 20°, 22°, 24° of frost were recorded here on successive mornings since the 23rd inst. The days have been clear and fine. The 25th was a beautiful day throughout. The rimc has been so dense that the whole country seems as if snow had fallen, and the cold is intense.—B. D., *S. Perthshire*.

— "MY GARDEN."—There are in flower in Mr. A. H. Smee's collection of Orchids at the above place a fair number of good things. Prominent amongst others I recently noticed a very fine piece of *Lycaste cruenta* and a very dark flowered form of *Lælia anceps*. The latter was exceedingly good indeed, the blooms being of a most beautiful dark colour, much resembling *L. Goldiana*, as staged by Messrs. Sander and Co. at the Drill Hall, Westminster, the other week.—R. H. R.

— THE SEVERE WEATHER.—During the past few days the weather has been most severe in various parts of the country. On Saturday night the hard frost appears to have been general throughout Britain, as well as on the Continent. In this country the thermometer duly sheltered in the screen had fallen below 20° in many districts, the lowest readings of all being 15° at Loughborough, 16° at York, and 19° at Oxford. In London the shade minimum was only 25° (which means 7° of frost), but on the surface of the grass the thermometer fell to 19°. In Scotland the weather had been even more severe than in England, a shade reading of 12° being recorded at Nairn, and a minimum of 20° at Wick and Leith. The morning readings on Christmas day were as low as 15° at Berlin and Munich, 17° at Brussels, and 20° at Paris. Early on Tuesday 18° of frost were registered at Grantham in Lincolnshire, and 16° at Peterborough. At Hawick in Scotland, 24° of frost were registered on the 26th, and 19° on the 27th inst.

— THE FLOWER GIRL'S GUILD, which was established for the protection of flower sellers in the streets of London, ought to be a flourishing as well as a wealthy body, to judge from the number of distinguished ladies who take an active part in its organisation. The Marchioness of Bath, Lady Alington, and Lady Granby are just now busily engaged in getting up a Twelfth Night dance in aid of these well-looking-after flower girls, who also number among their "Patronesses" the Princess of Wales, the Duchess of Fife, and the Duchess of Teck.

— NEW CANNAS.—One of the brightest coloured of the new Cannas is Alphonse Bouvier. The large flowers are so brilliant that even Madame Crozy looks dingy beside them, says an American contemporary. Sarah Hill is another variety of a peculiar brilliant tint, while Capitaine P. de Zuzzoni is an admirable yellow.

— MARKET VEGETABLES.—Nearly the whole of the English vegetable produce is grown in the Thames Valley and the home counties, says an authority. Cornwall and Devon contribute Broccoli and early fruits, while Potatoes come from all parts of the kingdom. Middlesex, however, is the centre of the vegetable and fruit growing industry, which is annually extending.

— COVENT GARDEN MARKET.—For more than 300 years, says a daily contemporary, fruit, vegetables, and flowers have been sold on the present site of Covent Garden Market. In 1661 King Charles the Second granted to William, Earl of Bedford, the right for ever to hold a market in the parish of St. Paul's, Covent Garden.

— "MUSHROOMS FOR THE MILLION."—Having followed out advice given in a book of the above title, we have been very successful with Mushrooms this season, whereas in previous years we have not had nearly so many. It would be well if any readers of the *Journal* who fail with them were to follow out the instruction given in the book referred to. I feel sure they would have cause to rejoice over abundant crops.—W. B. F.

— TILLANDSIA LINDENI.—In Mr. A. H. Smee's garden at Hackbridge are to be seen, just opening, some grand flowers of *Tillandsia Lindenii*. The blooms of this beautiful *Tillandsia* are, as most readers of the *Journal* will know, a pure celestial blue colour, rendering the plant conspicuous in any collection. It should certainly be much more largely grown than it is, as it does not require any extraordinary measures to bring it to perfection.—R. H. R.

— EXETER GARDENERS' ASSOCIATION.—The last meeting of the autumn session in connection with the Exeter and District Gardeners' Improvement Society took place at the Guildhall recently. Mr. Weeks (gardener to Mr. E. A. Sanders) presided, and there was a large attendance. Mr. Mackay (manager at Messrs. Veitch's Royal Nurseries) gave a *resumé* of the papers delivered during the year. The points raised by the essayist caused a good deal of discussion, especially upon such questions as pruning and the general treatment of fruit trees.

— FRUIT IN COUNTRY MARKETS.—Your correspondent "A. D." (page 505) hits the nail on the head when he asks why growers do not pack their choice Plums properly and smartly and despatch them to good markets. The same applies with equal force to other fruit. The outlay to obtain suitable boxes and paper is comparatively small, and that it pays in the end is a well-known fact. A case in point might be cited. An amateur grower in Lincolnshire had an enormous crop of Plums two years ago, many more than he required for his home. He decided to sell a portion, and, acting on my advice, packed the best of the choicest varieties in a similar manner to that advised by "A. D." The result was very satisfactory. Even in the local markets he secured double the price of those sold in the usual manner, the gentry in the neighbourhood buying them eagerly for dessert purposes.—LINCOLN.

— ALEXANDRA PALACE AND PARK.—For some time past H. R. Williams, Esq., The Priory, Hornsey, has been making strenuous efforts to secure the Alexandra Palace and Park for the free use and recreation of the people in North London. A meeting to that effect was held in the National Hall, Hornsey, on Wednesday, December 7th, Mr. R. D. M. Littler, Q.C., C.B., occupying the chair. The park comprised 434 acres, and is the grandest of all the open spaces available for the free use of Londoners. The whole of it, with the palace, could be bought for £275,000, and the Chairman expressed the hope that the Middlesex County Council, the Corporation of London, great landowners, and the general public concerned would be prepared to do something. Mr. H. R. Williams moved the following resolution: "That this meeting, recognising the importance of open spaces and their paramount necessity for the health and recreation of the growing masses of the population, believes that the alienation of the Alexandra Park for building purposes would be a lasting and irreparable injury to the northern suburbs, as well as to the metropolis generally, and is further of opinion that the time has come when more active measures should be taken to secure this unique park as an open space for ever for the free use and enjoyment of the people, and urges the County Councils of Middlesex and London to take such steps as they may think desirable for that purpose; and it further urges that nothing in the meanwhile be allowed to interfere with the public rights which now attach to 135 acres of the said park." Mr. Stephens, M.P., seconded, and the resolution was unanimously adopted.

— **ADIANTUM FARLEYENSE.**—Allow me to thank your correspondents who have so kindly given their experience of this beautiful Fern. Such notes cannot fail to be instructive to readers of the Journal, especially to those who have not been successful in growing this Fern. Your correspondents are unanimous in recommending loam in preference to peat to form the bulk of the potting compost. I quite agree with them on that point, also in the necessity of draining the pots well.—C. RUSSELL.

— **ROYAL METEOROLOGICAL SOCIETY.**—The usual monthly meeting of this Society was held on Wednesday evening, the 21st inst., at the institution of Civil Engineers, 25, Great George Street, Westminster, Dr. C. Theodore Williams, President, in the chair. Dr. R. H. Beardsley, Dr. T. C. Beatty, Dr. R. Brocklesby, Mr. C. H. Cotton, Dr. P. Fraser, and Dr. G. H. Ward-Humphreys were elected Fellows of the Society. The following papers were read:—

(1) "MOVING ANTICYCLONES IN THE SOUTHERN HEMISPHERE," by Mr. H. C. Russell, F.R.S., Government Astronomer, New South Wales. The author describes the results of his practical study of the daily weather charts for Australasia, and states that the leading fact brought out is that the weather south of 20° S. latitude is the product of a series of rapidly moving anticyclones, which follow one another with remarkable regularity, and are the great controlling force in determining local weather. These anticyclones are more numerous in summer than in winter, the average number for the year being forty-two. They usually take seven or eight days to travel across Australia in summer, and nine or ten days in winter, the average daily rate of translation being 400 miles. The shape of the anticyclone appears to undergo some modification as it nears the east coast. The winds on the north side of the anticyclone are not so strong as those on the south side, and the intensity of the weather is in proportion to the difference in pressure between the anticyclone and the V depression, but the relation of the pressures varies frequently before the wind responds, the pressure appearing to be controlled from above by the more or less rapid descent of air which feeds the anticyclone. Cyclonic storms are very unusual, and do not occur more than once in two or three months.

(2) "RAINFALL OF NOTTINGHAMSHIRE, 1861-1890," by Mr. H. Mellish, F.R.Met.Soc. The author has collected and discussed all the rainfall records made in the county during the thirty years, and finds that in the extreme west the mean rainfall is 27 inches or more, and that over the rest of the county it varies between 25 and 27 inches, except north of the Manchester, Sheffield, and Lincolnshire Railway, where the rainfall is less than 25 inches, and in the north-east towards Gainsborough, where it is not more than 23 inches. The year of greatest rainfall was 1872, and of least rainfall 1887. October is the wettest month and February the driest.

— **TEA GROWING IN AUSTRALIA.**—Experiments are going to be tried with a view of testing the soil and climate of certain localities in Australia for the cultivation of Tea. One paper suggests that Tea culture in Australia might be a recommendable venture. According to Müller the Tea plant has proved hardy in the lowlands at Melbourne, where, in exposed positions, it endures quite unharmed light night frosts, as well as the free access of scorching summer winds; but it is in humid valleys, with rich alluvial soils and access to springs for irrigation, that the most productive Tea fields can be formed. The greater the rainfall in any region otherwise adapted the richer the yield of the Tea plant. Its culture is not difficult, and it is singularly exempt from fungus diseases if planted in proper localities. Pruning is effected in the cool season, in order to obtain a large quantity of small tender leaves from young branches.

— **WINTERING ECHEVERIA SECUNDA GLAUCA.**—I find no difficulty in wintering these in a temporary made frame of stout boards or slabs about 18 inches high at the back, and 15 or so at the front. The bottom, which is on ashes, has a layer of freshly gathered leaves; on this we place any soil from the potting bench, old Chrysanthemum compost or anything of that character. The Echeverias are planted in the soil quite up to the leaves, stripping off some of the old foliage. If the root stem is considered too long for planting next year in the beds it is chopped off to within 4 inches of the leaves. These plants come in most useful for planting horizontally at the edges of the beds next year. Roots are formed between the middle of October and the time the plants are put out in May or June. All the covering the Echeverias receive during the winter is with straw thatched hurdles, and they answer capitally.—E. M.

— **BLUE TITS AND PEAS.**—These birds are very destructive with the early Peas in my garden. I have seen them taking the Peas when very small from the pods and carry them away to the nest for their young.—G. F.

— **ANCIENT SOCIETY OF YORK FLORISTS.**—The annual dinner of the Ancient Society of York Florists took place on the 21st inst. at Harker's Hotel, Ald. Sir Joseph Terry, J.P., presiding. The Chairman was supported by a company of about fifty in all. Mr. Alderman Rymer proposed the "Ancient Society of York Florists," and said he thought that it was filling a very important place in the welfare, elevation, prosperity, and entertainment of their fellow citizens. Responding, Mr. McIntosh said that never in the whole history of the Society's career had there been so many members, and to give some idea of its rapid progress he might remind them that some twelve or thirteen years ago they had only some 50 members, whereas now they had no less than 600.

— **ENGLISH ORCHARDS.**—Whilst lecturing on the culture of fruit in Westmoreland recently, Mr. T. R. Spelman, of Fulwood, said that three-fourths of the orchards in the country were in a lamentable condition and ought to be improved. The old worn-out trees he would grub up and clear away, the young varieties should be cut down and re-grafted in the spring, and the good varieties he would thin out well with a saw, so as to give them plenty of light and sun. The main branches and trunk should be scrubbed to remove moss and lichen. The following mixture he recommended to be used to rid the trees of caterpillars:—Two parts of lime, one of soot and some clay, mixed with water and made into a thin paste, and then applied with a whitewash brush to all the branches and the stem, being careful to smear every part of the tree.

— **DOUBLE PRIMULAS.**—I was pleased to see in the *Journal* of December 8th (page 503) a note of successful culture of these beautiful winter flowering plants. It is more in defence of the old double *Primula sinensis* I wish to draw attention, as I find it is most free in flowering. We grow a variety named Princess, very much like Mrs. A. F. Barron, but for freedom of flowering it does not approach the old Double White. The hybrids possess a much more vigorous constitution, therefore may be grown to a larger size. We have plants of both forms, averaging 15 to 18 inches through in 6-inch pots; some plants of the old Double White are larger than this, and about 6 to 9 inches in height. We earth up the collars in spring with cocoa fibre refuse and keep the plants in an intermediate temperature. When well rooted they are divided into as many parts as necessary, placed in small pots and put on a shelf close to the glass in a rather close stove. When filled with roots they are repotted as required, using a compost of loam and leaf soil in about equal parts, with a good addition of old mortar rubbish and a little bonemeal if obtainable. Watering is very carefully performed at all times, especially after potting. During the summer the plants occupy a pit facing south; a 4-inch pipe runs through the frame. We allow as much sun as plants will stand without flagging, and syringe on bright afternoons; they require plenty of air, but enjoy more warmth at all times than the single varieties.—W. B. F.

— **ROYAL CALEDONIAN HORTICULTURAL SOCIETY.**—PRESENTATION TO MR. P. NEILL FRASER.—On Friday afternoon last Mr. P. Neill Fraser, Treasurer to the Royal Caledonian Horticultural Society, was presented with a handsome service of plate in recognition of the gratuitous services as Treasurer of the society, a post which he has filled for the long period of twenty-three years. The presentation took place in the Royal Hotel, Princes Street. Mr. John Clapperton presiding over a gathering of well-known horticulturists. In making the presentation the Chairman spoke of the long number of years during which Mr. Fraser has given his services to the Society, and as showing how the Society had grown during that time he mentioned, that whereas in 1871 their funds were £90, now they were upwards of £1200. Again in 1871 their ordinary receipts, including the drawings at the annual show were £350, while last year they amounted to £1600, the prize money last year having alone amounted to £730. At the close of twenty-three years' service as Treasurer, the Directors had thought that the time had come when Mr. Fraser's services—gratuitous and disinterested services—should be acknowledged in some shape. In a sense the mantle of the late Dr. Neill had fallen upon Mr. Fraser, for he had always maintained a lively interest in horticulture and botany. (Applause). Mr. Neill Fraser suitably acknowledged the presentation. He said that a Society like theirs was not too often over-burdened with funds, and sometimes the Treasurer had a little difficulty in making both ends

meet; but, thanks to the cordial co-operation of the Directors, who had done everything to further the interests of the Society, his task had been rendered comparatively light. Mr. Fraser acknowledged, too, the assistance which the Society had always received from the nurserymen of Edinburgh, and stated that as many as 20,000 visitors had attended a recent Show of the Society in the Waverley Market. Mr. Fraser's health was cordially pledged, and thereafter the Chairman was toasted on the call of Mr. John Methven.

— SAVOY CABBAGES.—Just at this time of the year when Savoy Cabbages, and especially small ones like the Ulm and Dwarf Curled, are so abundant and delicious, more than ordinary interest may well be taken in this section of the Cabbage tribe. The distinguishing peculiarity of the Savoy Cabbage is its raised or corrugated leafage, distinguishing it so much from that of the ordinary white Cabbages. De Candolle, as we learn through M. Vilmorin, attributes this puffed or corrugated form of the Savoy leaf to the fact that the parenchyma or spongy substance is developed more rapidly than are the nerves or veins, and it is therefore in consequence raised above their level, not finding room enough to grow flatwise in the small areas between the veins. This form of growth seems to be productive of more tenderness in the leafage, and certainly of a more marrowy texture or substance. The flavour of the Savoy Cabbage also is more pleasant and mild. For these reasons small varieties are now specially enjoyable.—A. D.

— SCHEDULE SCAMPING.—I am pleased to observe that attention is drawn to the slovenliness which so often characterises schedules of shows. In how many instances do we find classes mixed up higgledy-piggledy—plants, cut flowers, fruits, and vegetables indiscriminately, the poor judges having to turn from one thing to another in the most erratic fashion. Surely in ordinary or special classes it should not be difficult to take the sections in due order—plants, blooms, fruits, and flowers, as is the usual way. Then, how many classes are there that are indifferently defined, or the conditions are so ill-drawn that all sorts of disputes arise? Were schedules properly prepared these disputes would very rarely be heard of. If there are no practical men on a committee, surely the help of someone capable might be obtained, or perhaps one may set up a sort of schedule reviser, to whom all prize schedules should be sent, that they may be put into shape, and made

FIG. 76 —SOPHRO-CATTELEYA CALYPSO.

to assume a sensible form. The putting-in of advertisements between the leaves containing the prize classes is an intolerable nuisance, and one is surprised that any committee should sanction such an arrangement. The society's matter and advertisements should always be kept distinct. Very often the classes are in too small type, and unduly crowded. Not infrequently also, instead of being in neatly bound book form, they are large loose sheets. It ought not to be difficult in any place to secure enough of advertisements locally to pay the cost of printing at least; and then the work should be done well, so as to give the advertisers their full money's worth.—A. D.

LÆLIA ANCEPS OWENIANA.

AN award of merit was adjudged this charming Orchid (fig. 77) at the meeting of the Royal Horticultural Society on Tuesday, December 13th, where it was exhibited by Mr. Owen, Selwood, Rotherham. It is a very distinct variety, and attracted much attention. The sepals and petals are of a brilliant rose colour, paler at the base, and with white patches. The lip is a rich magenta, the yellowish throat being streaked with the same colour.

SOPHRO-CATTELEYA CALYPSO.

THIS beautiful bigeneric hybrid is the result of a cross between Cattleya Loddigesi and Sophronitis grandiflora. It is a charming Orchid, and is likely to become a favourite. The flowers are intermediate in size, and the plant is also of moderate growth. The sepals and petals are of a rich rosy carmine, and are shorter than those of the Cattleya, but wider than in the Sophronitis. The throat is a rich yellow colour, and the lip is deeply margined with rosy carmine. A specimen of it was exhibited at the Drill Hall on Tuesday, December 13th, by Messrs. J. Veitch & Sons, Royal Exotic Nursery, Chelsea, when a first-class certificate was awarded for it. Fig. 76 represents it.

ORCHID NOTES.

"LINDENIA" for the current month contains well-executed plates of Cattleya × Hardyana Gardeniana, a very fine form of this hybrid Cattleya, which recently flowered in the collection of M. Garden, Bois de Colombes, near Paris, and which differs from the type chiefly "in the absence of the peculiar veining on either side of the disc of the lip;" and Cattleya Dowiana Statteriana, "one of the most handsome forms known. The sepals and petals are of a bright yellow shade, and the lip has far less of the purple colour than usual. The disc has a central band of purple lines bordered on either side by a broad band of yellow, the undulate margin being edged with lilac-rose." This variety was exhibited at a meeting of the Royal Horticultural Society on September 19th, 1890, and was then awarded a first-class certificate. The history of the introduction of Miltonia vexillaria is given at length, also an interesting account of the habitat of the plant and the climatic conditions under which it is found, accompanied by a plate of M. vexillaria virginalis, a variety with large pure white flowers.

A plate and description of Vanda insignis, introduced from Timor by Messrs. J. Veitch & Sons in 1867 and certificated by the Royal Horticultural Society in 1868, complete an excellent number of this publication.

CYMBIDIUM MASTERSI.

This beautiful Cymbidium may now be seen in flower in the cool Orchid house at Kew under the name of Cyperorchis Mastersi. In general appearance it resembles C. eburneum, but the leaves are longer, broader, and more recurved, and have not the close-sheathing base characteristic of the latter plant. The flowers, however, differ very much in shape from those of C. eburneum, and it is this difference that led to the generic name Cyperorchis being applied. The raceme is erect and many flowered. The flowers are pure ivory white, with a blotch of purple on the lip, and very fragrant. The plant possesses the further merit of flowering during the winter months, and the flowers last for a long time. It is a native of Assam, and was introduced by Messrs. Loddiges in 1841. It flowered for the first time in England in 1844, and was figured in the "Botanical Register" in the following year. It was named by Griffith after one of the principal assistants in the Calcutta Botanic Garden. The variety album has pure white flowers, except the keels, which are yellow.—A. B.

THE BLenheim ORCHIDS.

As briefly announced in a previous issue, the splendid collection of Orchids at Blenheim was sold by auction by Messrs. Protheroe & Morris on Monday, 19th inst., and the four following days. The plants were well cultivated, and a good many specimens of fine types were included. Among the specimens which realised high prices may be mentioned a plant of Cattleya Lawrenceae with 150 pseudo-bulbs, 25 guineas; C. Mendeli, 20 guineas, another 15 guineas; C. labiata autumnalis, 12 guineas; C. Skinneri, 11 guineas; a fine plant of Ada aurantiaca, £8; Cypripedium Morganiae, £5; Epidendrum prismatocarpum, which had thirty-five spikes last year, 8 guineas; Cymbidium eburneum, 9 guineas;

C. Mastersi, 6 guineas; *Cœlogyne pandurata*, a fine plant in a pan, 9 guineas; *Lælia anceps alba*, 14 guineas; and *Sobralia xantholeuca*, 9½ guineas. Other plants secured moderate prices, and were sold without reserve.

IMPORTED AZALEAS.

THOUSANDS of Azaleas, both *indica* and *mollis*, are imported annually from Belgium. It is said that the business is developing, too, very rapidly. The plants are sent direct to private growers, also to trade growers and wholesale firms, besides thousands are disposed of by auction. Gardeners, as a rule, are rather chary about purchasing these plants, for they are not always satisfactory; but I am under the impression the fault lies chiefly with the culture accorded them, which is not at all times judicious or rational either. When walking through a greenhouse I have had it explained to me that the Azaleas are not satisfactory, but then they were only imported plants last autumn. This answer may do very well in some cases, but I fear we shall have to find something more plausible to satisfy anyone used to the culture of such plants.

It is well known the plants arrive here without any pots, neither have they been grown in any. They are simply cut out of beds of leaf soil, at any rate 80 per cent. is composed of this material. This proceeding naturally root-prunes them to a remarkable degree, cutting away the greater part of the feeding roots. In most cases this soil gets dry by the time the plants reach their destination. I have seen it dust dry when the plants were unpacked in the auction room. This state of affairs does not improve the plants; on the contrary, it no doubt damages many of the roots that have already escaped injury. If we commence by over-potting, the first cultural mistake is made. I find they will just go in 6-inch pots, and allow a little peaty compost to be pressed round them. But before they are potted the ball of roots should be placed in a vessel of water till it is thoroughly saturated. After allowing the water to drain out, the plants will be ready for the pots. It is needless to remind the grower they require efficient drainage, for they will not brook sodden soil. For compost I prefer peat, leaf soil, and turfy loam in equal portions, with a liberal addition of road or silver sand. This compost may appear a little too light, but if it is used at a right degree of moisture it can be pressed very firm without becoming pasty, the latter condition should be scrupulously avoided.

After potting the plants require a cool house, where they will get plenty of air and light. This is the point where failure is often courted. The plants are found to be well set with flower buds, and the grower straightway resolves to have them in bloom early. Thus they are introduced into a warm house, probably a forcing pit. The result of such treatment is too well known to require detailing here. It appears to me to be absurd to expect plants to do other than fail under such circumstances. The heat causes the buds to swell, the leaves demand a supply of food from the roots, which they are totally unable to give, owing to their recent treatment, and the inevitable result follows. If cool treatment is given them the buds remain quiet, there is no demand, or very little from the leaves, and the plants have a quiet time to form plenty of roots before spring. I potted a small batch of *indica* early in October. They have been kept quite cool since. To-day I have turned out several of them, and am pleased to record the fact that they are making a quantity of beautiful white roots that will be able to support them sumptuously next spring when active growth commences again.—JAMES B. RIDING.

INSECTS OF THE FLOWER GARDEN.

(Continued from page 257.)

GARDENERS know how important it is, with many flowers that are grown for exhibition, to preserve the petals from all damage or displacement, and there is no doubt these sometimes occur through the visits of insects seeking honey or pollen. Some of my friends who have noticed certain of the larger flies on or near flowers, have fancied they might do harm to the petals by biting them, but most of the damage done in this way is to be attributed either to earwigs or to some species of beetle. Bees rarely bite flowers, though they are furnished with jaws; flies never do, for their sole implement is a proboscis or sucker; even the species that are predatory in habit cannot eat the insects they kill, they only grasp them firmly, imbibe their juices, and drop the bodies. Many of those flies we see haunting flowers come to them in order

to seize other insects, and do not touch the flowers themselves; there are also flies which seem to visit our flower gardens for no particular object, unless it be to enjoy their beauties.

Amongst the commoner flies of the garden we cannot fail to notice the conspicuous soldier flies of the family *Stratiomidae*, which come next to the crane flies, already mentioned. It is not very evident why they were thus styled, for they are not warlike, and though a few of them have red markings on a black ground, others are tinted with yellow or white. Some of them are large, broad-bodied, they possess spines on the thorax, and the bodies have more or less of a pattern upon them, in spots, streaks, or

FIG. 77.—*LÆLIA ANCEPS OWENIANA*.

triangles. They visit flowers for their honey, and do not seem to meddle with other insects; harmless species, ornamental in the garden, and while some of the larvæ or grubs live in ponds or ditches, others feed on decaying vegetable matter, so may be useful. One or two species are more slim and of brighter colours, such as the fly called *Sargus cuprarius*, a rather abundant insect in the south of England, yet beautiful, the thorax being golden green, and the abdomen purple. The larva or grub is said to live underground, possibly feeding upon roots. Flower gardens that are situated near woods or pastures have an occasional visit from one of the breeze flies, so named from the sonorous noise produced by their wings. We know them also by the names of oxfies, gadflies, and clegs. To cattle they are a cause of painful annoyance, and sometimes they produce quite a panic in a herd, while horses greatly dread them. The females are the hostile individuals; nor do they spare mankind; one species, a speckled grey fly, common in July and August, dashes fiercely at our faces and hands when it has the chance. It is the male of these insects that is likely to appear in gardens as a haunter of flowers. Both sexes have singularly lustrous eyes, green or crimson, and on this colour are stripes or spots of various tints. There is no reason to apprehend an assault from the male gadflies, for in disposition they are pacific, the females only being bloodsuckers.

Half buried in flowers, and looking as if they had entered them for the sake of a nap, we find some small globular flies that we call the *Acroceras*, distinguishable especially by their small heads, which seem only big enough to hold the eyes. Their food is the honey they obtain, and they offer quite a contrast to their active and powerful relatives, the *Asili*, flies remarkable for long bodies, a narrow thorax, and which have what has been described a "hungry look." Their hunger they satisfy by preying upon other

insects not having jaws. They grip their victims firmly with their front pair of legs, and drive the beak or proboscis into the body. This beak has rows of tiny spines, which make it a fatal weapon, and an Asilus is brave enough to attack and conquer a bee. It is only now and then this occurs, however, but the Asili are on the whole useful as killers of some insect pests. Most of them are of dull colours; a showy species often seen near the coast has been called the hornet fly (*A. crabroniformis*), nor is it unlike that insect, though but two-winged. Its thorax is yellow with two black stripes, the abdomen is half black and half yellow. It has an odd way of flying if alarmed, rising and dropping as it goes along, and is stated to feed chiefly upon caterpillars. While in the larval stage the Asili live either in the earth or amongst decaying wood, but as larvæ, or grubs, they are not believed to be injurious. A familiar fly of summer and autumn, specimens of which may be sometimes noticed resorting to the flowers of October is the bee fly, or *Bombylius major*. Its habits remind us of the ways of some of the smaller hawk moths, since it suspends itself, apparently, with wings unmoved in the air, obtaining the nectar by its long trunk. If approached it darts off faster than the eye can follow it. It is furnished with antennæ longer than those of bees, and its head is smaller than that of a bee. The resemblance is in the black, furry body, the upper side of which has golden hairs, while underneath they are black-and-white. The Eupidæ, or snipe-flies, have been named from the small round head and conspicuous flexile tongue; they fly around flowers, and subsist upon a mixed diet, taking honey occasionally, and also seizing any insects they may fancy which happen to be visiting the same blossoms.

A group of small and active flies belong to the genus *Dolechops*, and often by their lively movements and bright, more or less metallic, tints, they seem to give an air of cheerfulness to the garden as well as to the country scene. They run about over the leaves in preference to flying, and it is probable that they prey upon aphides or the scale insects at an early stage. From their being frequently seen in gardens which contain ponds or are near streams some think the larvæ are aquatic. So is certainly that of the drone-fly, or *Eristalis tenax*, a fly that is a common visitor to the Michaelmas Daisy or the Chrysanthemum of October and later. "It is an insect," says one, "which may be observed by hundreds in the autumn sun, making the whole air musical with their merry hum, and the very sunlight brighter with their glancing wings." But some people are afraid of this fly, because it has a way of working the hinder part of the body in a curious manner, as if preparing to sting. No wonder that it is a good flyer, for the wings are broad, and though the body is stout there is a good array of muscle. Many who see this insect about their gardens have no idea where it was bred, nor how singular is its history in the maggot state, when it was fulfilling its office in nature, not merely to remove what is offensive, but to turn it into what is sweet and wholesome. Some who have watched the proceedings of this insect have given it the name of the "rat-tailed maggot," not an unsuitable appellation. Possibly it is less abundant about gardens than formerly, since its home is in neglected tubs or butts which contain inches of mud beneath the water. Such receptacles our modern gardeners, save in a few instances, would not tolerate, but they are the home of the rat-tailed maggot, afterwards to become the bright and bustling drone-fly. Like many aquatic creatures, air is necessary for its existence, and when immersed in mud this maggot would be unable to obtain this were it not furnished with a peculiar and telescopic tail. This is double, and is so contrived that the tubes can be lengthened out or drawn closely together whenever the maggot chooses; its length varies in different specimens. Having reached the full size this larva quits the water to become a pupa on dry ground.—ENTOMOLOGIST.

ZONAL PELARGONIUMS IN WINTER.

FEW plants are more thoroughly useful for supplying brilliantly coloured flowers during the dark days of winter, when bright bits of colour are so much appreciated, than the many grand varieties of Zonal Pelargoniums which are now universally cultivated. Given good plants to start with, the whole secret of success in their winter management lies in the proper regulation of heat, air, light, and water.

A light span-rooted house or pit, well heated and provided with the means of giving constant ventilation, should if possible be devoted to their culture, for the plants will not flower freely unless they are surrounded by a rather dry and warm atmosphere. Neither will the colour of the flowers be so vivid unless these conditions are maintained. We manage to keep up a constant supply of these showy flowers during the winter months. Our plants are arranged in two pits; they are kept as close to the glass as it is possible to have them, without allowing the flower trusses to touch it. The hot-water pipes heating these pits are never allowed to get cold, though, of course, during warm or bright

weather less artificial heat is used than when cold winds or frosts prevail. A free circulation of air is provided continually by tilting the lights. During ordinary weather these are raised at both front and back by means of boards. No alteration is made in ventilation for a few degrees of frost, but instead of reducing the air the heat in the hot-water pipes is increased. During sharp frosty nights the front air is taken off and about an inch of space is left open at the back. Our aim is to give the plants plenty of heat and an abundance of air. By these means we secure short-jointed shoots and abundance of brightly coloured flowers. I know of no other way by which these plants can be induced to flower thus freely in winter and at the same time have their growth kept sturdy.

There are many grand winter flowering varieties in commerce, and the list of good ones is being continually added to. Among the older kinds, those which I find most suitable for the purpose are—Singles: Etna, crimson scarlet; John Gibbons, rich scarlet, large truss; Vesuvius, bright scarlet, small trusses produced in great abundance; Rosalie, salmon pink; and White Perfection, truss compact, colour pure. Doubles: F. V. Raspail and Wonderful, both scarlets, and Candidissima, white. I find the singles are more generally admired than the doubles, and the difficulty about the petals falling may be easily overcome by dropping a little floral cement with the aid of a pointed stick into the centre of each flower.—D.

PLANTING BANKS AND SLOPES.

If you can allow space in your Journal I should like to recommend two ways in which banks may be planted with very good effect. Frequently such positions in gardens have to be dealt with, and it is generally necessary to so occupy them that the minimum of attention is required to keep them in order when planted.

My first suggestion is simple and suitable for most aspects—viz., to plant *Cotoneaster microphylla* thinly as a general covering, and fill in all available space with the tall growing *Narcissus*; by a judicious selection of varieties a good succession of bloom could be extended over at least two months in spring. *N. poeticus* especially should be planted in large numbers. The blooms will grow up through the *Cotoneaster*, and by it be protected from being broken down by strong winds and rain.

The second method is an adaptation of the rock garden principle, using the larger growing plants and shrubs, and arranging them as informally as possible with any large stones or tree stumps—that may be procurable—interspersed. I append a selection of suitable plants which may be established in a groundwork of *St. John's Wort* and *Variegated Periwinkle* :—

<i>Acanthus latifolius</i> .	<i>Phormium tenax</i> .
" <i>mollis</i> .	" <i>variegata</i> .
<i>Berberis Darwini</i> .	<i>Retinospora plumosa aurea</i> .
" <i>stenophylla</i> .	" <i>ericoides</i> .
<i>Cotoneaster microphylla</i> .	<i>Saxifraga cordifolia</i> .
" <i>rotundifolia</i> .	" <i>crassifolia</i> .
<i>Funkias</i> .	<i>Sedum spectabile</i> .
<i>Forsythia suspensa</i> .	<i>Veronica Traversi</i> .
<i>Iris germanica</i> .	<i>Yucca filamentosa</i> .

Many other plants and shrubs are also suitable, and will suggest themselves in a general way.—W. H. L.

FRUIT FORCING.

Vines.—*Earliest Forced.*—The Vines that were started early in November, whether in pots or planted in the borders inside, will now have the root action excited by the development of the foliage. Great care is required at this stage to avoid chills, such as those resulting from cold currents of air and watering with cold water or liquid manure. The temperature about the pots should be kept steady at 70° to 75°, pressing down the fermenting material, and adding fresh, but sweetened, as required, it being a good plan to keep a heap of leaves and stable manure in reserve, from which the supply may be drawn as needed. Disbud and tie down before the shoots touch the glass, not being in too great a hurry in stopping. When two leaves are made beyond the bunch the laterals of pot Vines should have their points pinched off at that point of the shoots, but those planted in the borders, and there being space, may be stopped three or four joints beyond the fruit, and then extend the growth so as to secure as much well-developed foliage all over the house as can have full exposure to light, taking care to avoid overcrowding. Superfluous bunches should be removed as soon as choice can be made of the best, leaving those for the crop that promise to be the best shaped and most compact; and it is better to have the Vines under rather than overcropped. The night temperature should be maintained at 60° to 65°, and 70° to 75° by day, with an advance of 5°, 10°, or 15° from sun heat. When the flowers open keep the temperature 70° to 75° regularly, and maintain a rather dry, but not arid, condition of the atmosphere; and when the fruit is well set return to the temperatures previously named. Vines in pots should, as soon as the

fruit is set, be copiously supplied with liquid manure, yet it must only be given when the soil is moderately dry. Maintain a moist genial atmosphere by damping the paths two or three times a day, and occasionally with liquid manure, not too strong, or the ammonia volatilised may prove injurious instead of beneficial to the foliage.

Houses to Afford Ripe Grapes in June.—These are the first in a majority of establishments, and are often planted with a medley of varieties, which cannot all have proper treatment. Black Hamburg, Mill Hill Hamburg, and Madresfield Court are good black varieties, and of white kinds White Frontignan, small, but esteemed for its rich flavour, forces well, Buckland Sweetwater, and Foster's Seedling also answer well. The Vines should be planted inside the house and be confined to the inside border until it is occupied with roots, when they may be allowed to pass into the outside border. This must be covered with 3 inches thickness of dry leaves with a little long stable litter over them to prevent their blowing about. If the roots are entirely in an outside border it should have some fermenting materials—two parts leaves and one part stable litter—mixed, placed thereon, turning and adding to them from time to time so as not to allow the materials to become cold or a close soapy mass. If that cannot be done, it is better to cover the border with about 6 inches thickness of leaves and enough stable litter on them to keep them from displacement by wind, and reduce this covering in late April or early May to an ordinary mulch—enough to cover the surface about an inch. The house should be started at the new year, watering the inside border thoroughly with tepid water, but not over 90°, and when the soil has been brought into a moist condition an application of tepid liquid manure may be given to weakly Vines or those in borders of limited area. This will enrich the soil and become assimilated and available as food by the time the Vines burst into leaf. Damp the house and Vines two or three times a day in bright weather, but when dull once, or at most twice, say in the morning and early in the afternoon, will be sufficient. Maintain a temperature of 50° to 55° at night and on dull days, advancing to 65° from sun heat and a free circulation of air.

Houses from which the Grapes have been Cut.—Pruning should be completed without delay, cut to a round bud as near the main stem as possible, shorten or cut away elongated spurs where there is others nearer the stem to supply fruit, or train up young canes to displace them. Remove loose bark carefully, not scraping into the quick or live bark, and thoroughly cleanse the house, washing the Vines with a solution of softsoap, 4 ozs. to a gallon of water, employing a brush, and reaching into every hole, angle, and crevice. Avoid strong soapy solutions, as they dry the bark and cause the Vines to break weakly—in fact, growth is not free until the substance is softened and removed by syringing the rods. Remove the loose surface soil, especially near the collar of the Vines, and supply fresh loam, with about one-third of earth-closet manure mixed with it, or decayed stable or preferably farmyard manure. If these are not forthcoming, add a 9-inch potful of bonemeal and double that quantity of wood ashes from hedge trimmings to every 3 bushels of loam, and if a 9-inch potful of blood, dried and ground, be added the mixture is one of the very best for top-dressing Vines. Loam seems to favour root formation, and it holds the other fertilising substances, so that the roots find abundance of nourishment when proper supplies of water are given during active growth. A couple of handfuls of the mixture, without the loam, sprinkled on each square yard of border and lightly pointed-in greatly aids the growth of the Vines. The house should be kept cool, but frost is best excluded. If used for plants the temperature ought not to exceed 40° to 45° by artificial means, and those plants only that require safety from frost should be placed in vineries when the Vines are at rest. If the house has a mean temperature of 50° the buds will be excited, and that is prejudicial to the after-growth.

Late Houses.—Muscat of Alexandria and Canon Hall Muscat are extremely difficult to keep on the Vines after Christmas, which may be due to the fluctuations of temperature and variability of the atmospheric moisture, the principal difficulties being to keep the temperature even and prevent the deposition of moisture on the berries. This usually occurs after a cold period, the heat of the sun expanding the atmospheric moisture, and it is deposited on the cooler surfaces of the Grapes, which do not become warmed equally with atmospheric air. Some growers prefer to let the Grapes remain on the Vines. To keep the temperature equable and exclude fogs and damp cover the roof of the house with straw or similar material, keeping the house freely ventilated in mild weather and close and cold, with little more heat than is necessary to exclude frost. Grapes so kept weigh heavier than those that hang some time in a drier and warmer atmosphere, and Muscats so preserved command long prices, but the Grapes do not always keep well. For general purposes, Grapes are best kept after the new year in a Grape room, cool, dry, and as equable in temperature as possible, and the more wood they are cut with the better they keep. Place a lump or two of charcoal in each bottle before the end of the shoot is inserted in the rain water, and there is then a certainty that it will keep sweet up to June. Any dry room is suitable for keeping Grapes in bottles of rain water, provided the temperature is kept equable, or as near as may be at 40° to 45°. By cutting and bottling the Grapes the Vines are set free for pruning and cleansing the house. Alicante and Gros Colman, also Lady Downe's, succeed well under the close-pruning system—that is, spurring to one or two buds, the bearing shoots being stout and short-jointed; but Gros Guillaume and Mrs. Pince do best on the long-pruning system—that is, prune the shoots to a plump bud on well-ripened wood, as the small basal buds are seldom

reliable, often pushing fruitless shoots. Muscat of Alexandria and Canon Hall Muscat also succeed best on the extension system, but sturdy, short-jointed, well-ripened, and not over-cropped shoots of these varieties generally show enough fruit when pruned to two buds, but when the buds are small and the growth weak or long-jointed, it is better to shorten the shoots to the first plump round bud from its base, always taking care to rely on those only on well-ripened wood. Where the Grapes cannot be cut for some time the mean temperature should be maintained at 45°, 5° less as a minimum, and 5° more as a maximum, admitting air constantly in mild weather, but keeping close when foggy and cold, but with a gentle warmth in the pipes to insure the air moving.

THE KITCHEN GARDEN.

Mushrooms.—The weather having, as a rule, kept very mild, there has been little or no necessity for resorting to fire heat in order to keep the beds in a productive state. In reality fire heat would, unless very sparingly applied, have done more harm than good, the heaviest crops of the most solid Mushrooms being produced in a temperature ranging from 50° to 55°, no harm whatever resulting by occasional drops to lower figures. Supposing some of the beds now require a little new life put into them, and those spawned late give no signs of moving, turn' on fire heat is advisable. The old, dry, and apparently exhausted beds should have a gentle yet thorough soaking of warm water in which salt has been dissolved at the rate of about 1 oz. to the gallon. Against this may well be tried a light surfacing of Thomson's manure, this being washed in by warm soft water, or it may be dissolved in the water prior to using it at the rate of 4 ozs. to a three-gallon can of water. Old mulching material should be cleared off the beds, and a thick covering of soft strawy litter substituted, this serving to keep the beds sufficiently moist without the necessity for frequently syringing over them. Let the late spawned beds start naturally. There ought to be plenty of moisture contained in them, and especially if fire heat has been withheld whenever the weather was mild. As many as three distinct crops can sometimes be had from beds not forced too hard, not overwatered, and not overrun by a destructive fungus which generates about old Mushroom stumps that cultivators have thoughtlessly left in the soil. Always scoop out the old stumps, and refill the holes thus formed with fresh fine loam. If there is room continue to form fresh beds, taking care to spawn these before the heat has declined much below 85°. Open Mushroom houses as soon as possible, especially when the doors are facing a cold quarter. If the same pains were taken in excluding cold air as there is, though with less urgency, in excluding light, far better crops of Mushrooms would usually be obtained. It is the equable temperature and genial warmth of a cellar that best suits them, and these conditions should be imitated as much as possible.

Open Air Beds.—Under good management there ought to have been extra good and almost continuous crops taken from these up to midwinter. If the beds have not done well they may yet produce heavy crops early in next spring, therefore do not neglect them. Heavy cold rains ought to have been carefully excluded, the two extremes, excessive dryness, consequent upon overheating, and saturation, being alike prejudicial. Take advantage of a mild day and remove all the cold wet mulching from the surface of the beds, and before covering with fresh litter take good note of the whereabouts of any clusters of Mushrooms there may be showing, in order that these may be gathered without greatly exposing other parts of the bed. Cover heavily with fresh strawy litter, a thickness of 18 inches not being too much, disposing and fastening it down in such a manner as to effectually exclude heavy rains as well as cold winds and frosts.

Salading.—The Mushroom house in addition to being very suitable for forwarding Seakale and Rhubarb is also a good place for blanching Endive and Chicory. If a few dozens of Endive are every week or ten days transplanted to a bed of moist soil or even ashes, packing them closely together, they will blanch very effectively in about a fortnight, there being less waste when so blanched than by other methods. The produce will not keep long after it is blanched. Strong roots of Chicory having any green tops twisted off, and then either placed in pots or boxes of moist good soil, or bedded in some of the latter, will quickly produce quite a profusion of strong well blanched leaves, a few of which add to the appearance and flavour of a mixed salad. A gentle heat is now required for Mustard and Cress. Sow every week in boxes and rather thickly on the surface of quite fresh rich soil. It will damp off badly unless the soil is completely changed every time. Keep uniformly moist and well darkened by either paper or mats till the stems are 1½ inch long, and then expose gradually to the light; also removing the boxes to rather less heat, commencing cutting directly the tops are green. Thus grown there will be a good length of blanched stems, this adding both to the appearance and quality of the salading. It has been possible to cut small hearts of Lettuces in the open up to the present time, but this late growth will be the means of greatly lessening the chances of the latest raised plants being of any service next spring. In any case it is advisable to raise an early batch of either Golden Queen or Early Paris Market, both very superior Cabbage varieties, which force admirably. Sow the seed thinly in boxes or pans, placing these in gentle heat and not far from the glass. Before the plants are far advanced in growth have a frame on a mild hotbed ready for their reception, a bed of soil not far from the glass in a two-light frame growing a remarkably fine lot of early Lettuce without very much pains being bestowed upon them. A frame should also be made ready for Radishes and Carrots when either are in early demand.

THE BEE-KEEPER.

APIARIAN NOTES.

COLOURED COMBS.

THANKS to "C., Northumberland," for the reply on page 558. There are different causes for coloured combs—viz., pollen, propolis, and sometimes the determination of bees to imitate the already darkened brood combs within their hive. This may be seen by the newly made comb pendant on the old comb, while that on white comb is also pure. Opinions differ why this is so, as well as how the change is wrought. Having in view those facts we discourage the practice of admitting bees to supers from the centre of the hive; and our supers, although tardily filled, are pure and delicate—a thing unknown to the greater number of bee-keepers in England until the first Crystal Palace Show in 1874.

TESTIMONY.

The "British Bee Journal" referred to our honey at that time as follows:—"The pride of the Show came from Ayrshire in octagon Stewarton supers of about 4 inches in depth, and truly it was a pleasure to look at them, a treat in itself to see how the art of the master could induce the bees to build their combs so beautifully straight, so symmetrical, and even on both sides, and so perfectly finished that one could have declared they were cast in a mould to pattern; and who could fail to admire the perfection in the art of packing by the Ayrshire gentlemen, who brought their immense harvest over 400 miles of railway almost without breaking a single comb; while scarcely one of the damaged supers had one-fourth of the journey to undergo." The "Times" reported that our exhibit "eclipsed everything." Now some of the supers referred to were produced from hives on the two-queen principle. After this restatement of a stern fact, who will give credence to the "idle" talk that the idea "is new," or who can deny the fact that the world is indebted to the *Journal of Horticulture* for primary information on the successful and practical management of bees? This is the truth, notwithstanding what may be advanced elsewhere to the contrary.

THE EFFECT OF FLOWERS ON SUPERS.

The common Ragweed, when bees work upon the flowers, give the supers a high yellow colour, as do other abundant yielding pollen plants. The only preventive is to exclude the bees from supers elsewhere than at the sides, which of course means relegating the zinc queen excluder to the lumber room.

THE STUDY OF BEES.

I am inclined to think that students of horticulture should turn their attention in a general way to the study of entomology, and to bees in particular. There is a wide, but still unexplored field for thought and action. The whole natural history of bees is fraught with interest. Their purpose is to fertilise flowers and prevent in-and-in breeding. Nature has endowed them with an extraordinary fecundity to effect her purposes at the proper time. They flower their sweets for bee preservation, and man shares the honey with them.

The bee lives, with the exception of water, entirely from the plant, and one is dependent upon the other, everything suitable for interharmonious action being provided in both in a manner that compels admiration.

From the tiny egg to the perfect insect, the evolution through a series of transformations is sixteen days; from eighteen to twenty in the worker, and from twenty-one to twenty-four in the drone, the young requiring attention from the bees during the whole of these periods. Now, contrast bees with the eggs, transformation, and ulterior motives of some of the saw flies and butterflies which take care of themselves from the moment they are hatched. If these things do not incite within the student a desire to study the

life history of the foes and friends of the garden he fails to look to his own interest and pleasure, at least this is the opinion of—
A LANARKSHIRE BEE-KEEPER.

* All correspondence should be directed either to "THE EDITOR" or to "THE PUBLISHER." Letters addressed to Dr. Hogg or members of the staff often remain unopened unavoidably. We request that no one will write privately to any of our correspondents, as doing so subjects them to unjustifiable trouble and expense.

Correspondents should not mix up on the same sheet questions relating to Gardening and those on Bee subjects, and should never send more than two or three questions at once. All articles intended for insertion should be written on one side of the paper only. We cannot reply to questions through the post, and we do not undertake to return rejected communications.

Aquatics for a Small Fountain-basin in a Conservatory (F. E. W.).—*Aponogeton distachyon*, *Limncharis Plumieri*, and *Pontederia cordata* are the most likely to answer your requirements, the first

being one of the finest aquatics, the flowers white and deliciously scented.

The Largest Bunch of Grapes (Foreman).—We made no mistake in the dimensions of the Arkleton bunch that was referred to a few weeks ago. It was carefully measured by a representative of this *Journal*, and a photograph was taken as the bunch was hanging on the Vines. As you and many other new readers have not seen the illustration we reproduce it. The bunch measured 2 feet 3 inches across the shoulders, and was the same in length. The circumference, following the contour of the shoulders to the body of the bunch, was 8 feet. The weight of the bunch at Edinburgh was 25 lbs. 15 ozs.; one from Eskbank, smaller, but more solid, weighing 26 lbs. 4 ozs. When first cut, the late Mr. Dickson of Arkleton always said his huge bunch weighed 26 lbs. 8 ozs.

Plants for Rockery (F. D.).—It is difficult to name plants that rabbits will not eat, as much depends upon their number, the severity of the weather, and the scarcity of their natural food—i.e., grasses and other herbage. The following are not usually eaten by rabbits, and will grow in rather shady situations, but not under the drip of trees:—*Arabis albidia*, *Aubrietia græca*, *Azalea amœna*, *A. procumbens* (the two last are dwarf shrubs requiring heat), *Campanula garganica*, *Cistus* vars. but they are not very hardy; *Cotoneaster rupestris* (dwarf shrub); *Cyclamens Atkinsi*, *Coum*, *vernum*, *hederæfolium*, and *neapolitanum* do well in shade at the foot of rockwork; *Cytisus decumbens*, *Daphne Fioniana*, *Erica carnea*, *Genista præcox*, *Geum montanum*, *Iberis corraefolia*, *Lithospermum prostratum*, *Phlox Nelsoni*, *P. verna*; *Primulas* in variety do well at the foot of rockwork in partial shade; *Rhododendron hirsutum*, *Rosa rugosa*, and var. *alba*, *Saxifraga Camposi*, *Sedum spectabile*, and *Sempervivum arachnoideum*. The *Vincas* and *Hypericum calycinum* form a dense covering in shade, and rabbits care nothing about them. *Hellebores*, *Trollius*, and *Trillium*, do well in partial shade, and are fine at the foot of rockwork, where they have plenty of good soil and moisture.

Root-pruning Apple and Pear Trees (H. G.).—The Apple is a less deep-rooting tree than the Pear, but both strike roots almost straight down in loose soils, producing few fibres, and consequently the trees are unfruitful. Root-pruning is intended to bring too gross growing trees into a bearing state by checking exuberance of growth. It is less needed when Apples are worked on Paradise stocks or Pears on the Quince, but all, in most soils, require root-pruning during the earlier stages of their career. When the trees are over-luxuriant uncover the roots, see where the strongest and most straight-down are, and sever these within a foot to a yard of the stem of the tree, according to its size and strength, any long and bare horizontal roots being treated in a similar manner, taking especial care of the fibres and small roots. If the trees are very vigorous and the roots are large and few, it is a safe plan to operate on one side only one year and defer the other until the next, for root-pruning should never be carried to excess, but looked upon as a means for checking luxuriance and increasing the fruitfulness of the trees. Some judgment must be exercised, not forgetting that root-pruning lowers the growing powers of the tree, and that stunted growth is as undesirable as exuberance. Moderate root-pruning is safe, and far more effective than pruning the tops of trees. The cuts of the roots should be made on the under side, and as clean as possible. The best time to operate is as soon as the leaves commence falling, say from the middle of October to the end of November, Pears being sooner fit for root-pruning than Apple trees, but the work may be performed any time between the fall of the leaves and the commencement of the buds swelling, always choosing mild weather, with the soil in good working condition. Shortening the roots and thinning the branches of too strong growing trees undoubtedly incite to the formation of blossom buds.

Sulphate of Iron for Apple Trees (F. J.).—Sulphate of iron, according to M. De Breuil, aids the growth of fruit trees and increases the size and quality of their produce. M. Müntz also says, "With iron sulphate the increase is 30·2 per cent." Iron sulphate increases the chlorophyll in crops to which it has been applied 9·6 per cent., and this is the main agent essential to the colouring of fruits. Most of the soils of this country contain enough iron for the requirements of Apple trees, yet it is not always in the most suitable form for root absorption, and the trees may not obtain the requisite amount from the soil to promote a healthy growth. For those reasons we find Apple trees canker badly where the ground contains more than 4 per cent. of iron oxide, and such soil needs be ammoniated to render the iron useful. Clayey loams have the iron oxide in the most available form, and fruit trees thrive best on such soils and produce the best fruit, but these soils must have the pan broken up, so that air and rain can penetrate freely, and if some manure is mixed with the hard pan the iron becomes available, also retains ammonia and phosphoric acids in soils. The application of iron sulphate to soils containing 5 to 6 per cent. of iron oxide (Fe_2O_3) has no beneficial action, but such instances are rare, and Apples grown in iron soils, termed red, as those of Herefordshire, Gloucestershire, Somersetshire, and Devonshire, contain more saccharine matter, greater specific gravity, carry the most colour, and make the best cider. It has to be remembered, however, that the beneficial action of iron depends on the presence of other essential plant foods in adequate corresponding ratio; therefore, sulphate of iron as a manure can only prove useful in soils that are deficient of available iron, say less than 4 per cent., and when they also contain potash, phosphates, and lime, and then it (iron sulphate) possibly benefits by aiding the absorption of nitrogen and

phosphoric acid, the sulphur acting as food or energy for the protoplasm of vegetable cells and the iron for the chlorophyll. Iron sulphate must not be applied in large quantities, 1 cwt. per acre being a full dressing, and three-quarter cwt. is sufficient in most cases, or a quarter of an ounce per square yard. The sulphate of iron should be mixed with ten times its weight of soil and distributed by hand evenly during moist weather in early spring, always when the ground is wet.

Smilax Culture (F. E. W.).—You do not name the species, and the genus *Smilax* embraces stove, greenhouse, and hardy representatives. *S. aspera mauritana* is a beautiful evergreen climber of considerable size, half-hardy, but well suited for a conservatory. *S. ornata* has handsomely marked leaves, spotted freely with silvery grey on a deep green ground, the markings being confined to the spaces between the veins is of moderate growth, forming a handsome pot specimen trained to a trellis, and requires a greenhouse temperature, warm rather than cool. *S. Shuttleworthi*, with large cordate, acuminate, deep green leaves blotched with silvery grey, the young leaves purplish at back, is a free-growing stove climber. *S. variegata* (*salicifolia variegata*) has the leaves finely marbled with white between the ribs; is very ornamental, and requires a greenhouse temperature. Those are, perhaps, the best of *Smilaxes*, which thrive best in a sandy loam with good drainage, and abundant supplies of water when growing, with a genial atmosphere. Perhaps, however, you have in mind the popular plant *Myrsiphyllum asparagoides*, that is popularly called *Smilax*, the green sprays of which are employed in bouquets and floral decorations. The plants succeed in warm or comparatively cool houses, the growths twining up strings. One of our correspondents has recommended it for covering the back walls of vineries. He says:—"I planted it along the back wall of a vinery last season, and trained it up by simply tying small strings to the bottom and top wires. The shoots soon took to these, and no more attention was required in the way of training. It is astonishing how closely the shoots keep twining themselves round the string, though resting against the intermediate wires. In no case did a shoot get behind a wire or twist itself round one, so that I cut any number of shoots up to 11 feet in length beautifully covered from top to bottom with its glossy foliage. The strings can be easily drawn out when the shoot is cut. These long sprays are very valuable for table decoration, as they can be twisted about in any form desired. I am just now preparing sufficient plants for five or six other houses in the same way. The plant is easily raised from seed. After it is established it keeps throwing up young shoots year after year. I cut twenty dozens of those sprays during the Christmas week. Anyone who has much house and table decoration to do can easily understand what the value of those would be at such a time."

COVENT GARDEN MARKET.—DECEMBER 28TH.

CHRISTMAS CATTLE MARKETS.

"REALLY prime quality cattle are very short in supply, and with an over-supply of second sorts the trade was dull." This quotation from one of several recent market reports is characteristic of all, and is really a key to the unsatisfactory condition of the markets for home-bred cattle. The bulk of so-called fat beasts are of inferior quality, and for such stock prices rule low, but for really superior beasts prices are, and have been, fairly remunerative. About 6½d. per lb. may be taken as the average wholesale rate for live beasts, and 5½d. per lb. for the best American refrigerated beef by the quarter. There can be no question that very much of this imported frozen meat is sold by butchers as the best Scotch, and sirloins at 10d. per lb. must afford a very handsome profit to the man who can sell enough of them. Heifers of about 180 lbs. have been sold in the Midlands at 6½d. per lb. by weight. Such beef is of the best quality, and was decidedly cheap, but there would probably be two or three profits out of it subsequently before it came into the consumer's hands.

It was with some curiosity that the great London Christmas market at Islington was looked forward to. This, called the "Islington Great Day," was held on December 12th, and was, on the whole, satisfactory. The number of beasts offered—5520—was well up to the average of the last four years, the prices ranging from 2s. 4d. to 5s. 4d. per stone of 8 lbs., being very much the same as in 1891 and 1890. No foreign cattle was on the market, so it was a fair test of the value of home-fed beasts, and though on the whole satisfactory, it must be owned that the number of animals reaching the higher figure was small, but the price was well maintained, the trade in the best class of stock being steady if slow. As usual at this market, Scotch beasts took the highest price of 5s. 4d. Next came Norfolks, Devons, and Shorthorns at 5s. 2d., Herefords and Welsh Runts at 5s., and Irish at 4s. 8d. per stone of 8 lbs. It is clear, therefore, that there is no radical change in the value of really high-class beasts, and that low prices generally are owing to so many inferior animals being regularly sent to market week by week. Alarmists as well as producers point to this as an outcome of hard times, but they take care to make no mention of the steadily sustained value of really good stock.

While the great Christmas market shows this reasoning to be correct, Central Meat Market reports tell of an overstocked supply of 5200 refrigerated quarters of American beef to hand in a single day; also of a steadily increasing supply of beef from this source, so that anything like an important reaction in the price of inferior cattle is highly improbable. Good and not evil will certainly come of this, if it forces graziers to reduce their head of stock, and to adopt an improved system of feeding. Store cattle out on pasture now in all changes of weather, hoar frost and snow often covering the pasture, may and do survive such exposure, but they become very low in condition by spring.

The small ration of hay which they have just serves to keep them alive, and it does very little more. Now, take such cattle next May Day, and see if any reasonable man can expect them to become prime fat beasts in the course of the next six months. To those farmers who have the whole of their cattle comfortably established in yards in snug quarters, well fed, and well cared for in every way, our statements about such suicidal exposure and negligence of animals may appear overdrawn. We assure them they are not. Several times recently have we driven considerable distances to catch early trains in Derbyshire and Leicestershire; and we invariably see both horse and cattle stuck out; often in meadows in bleak situations, always in a state of semi-starvation.

The highest quotation for sheep at Islington was 5s. 6d. per stone of 8 lbs., or 6d. per stone less than last Christmas, owing partly to the fact that the supply—15,290 head—was the largest on record, being 720 more than last year. It was the small choice South Downs of about 60 lbs. that made the top price, other breeds falling in value very much according to weight, as for example, Hampshires of 11 stone being quoted at 4s. 10s. to 5s., and Lincolns of 12 stone at 4s. 6d. to 4s. 8d. The higher quotation of 5s. 6d. is really the lowest price at this particular market for the last five years. In 1887 the number was 13,330, and the highest price 5s. 4d.; in 1885 there were 13,650, and the price was 5s. 8d.; and in 1884 there were only 9940, and the price fell to 5s., the lowest price during the last thirteen years. On the whole, therefore, there is no reason for alarm, on the contrary rather for satisfaction, regard being had to the enormous annual increase in the number of frozen carcasses of mutton imported from New Zealand and other countries.

WORK ON THE HOME FARM.

"Just for fancy" many a farmer has a fat beast or two for the Christmas stock sale of his particular locality. It is a pardonable piece of extravagance even in these hard times, and it is quite inspiring to visit a farm where only really well-bred, well-fed animals are kept, to discuss the merits of prizewinners, as well as details of management. Only we do not advise having a large head of fat beasts tied up after Christmas; a moderate number there may be if they are fed solely upon home-grown corn, but there must be no bills for oil cake, the farm must be self-supporting. The strictest attention must be paid to every detail of cost, for it is ridiculous to go on year after year feeding beasts at a loss, as is now so frequently done.

Fine open weather, enabled the ploughs to be kept going and Wheat sowing to be done right up to Christmas on light and mixed soils, then the work ceased. Sheep folds on excellent crops of Cabbage have been possible on such land. The hard frost will do much good in shattering heavy land and rendering it fit for tillage. To those in arrears with ploughing we say, Try another autumn to get the work done sooner. Then with surface and underdrains in order every shower that falls does good to the land, air enters freely too, frost lays hold of it, and all natural influences tend to improve and prepare it for cropping in spring.

REMARKS.

18th.—Fine, with occasional gleams of sun about midday.

19th.—Overcast all day.

20th.—Overcast throughout.

21st.—Slightly foggy in the morning; fair afternoon.

22nd.—Fog all the morning; a little misty in the afternoon; bright night.

23rd.—Fine, with occasional gleams of sunshine in the afternoon.

24th.—Bright and sunny throughout.

A rainless week, with steadily decreasing temperature and small daily range.—G. J. SYMONS.
